What ages of pollock are caught?

- New 2017 catch-age data

**Fishery
catch-at-age**

Age

Looking at weight-at-age

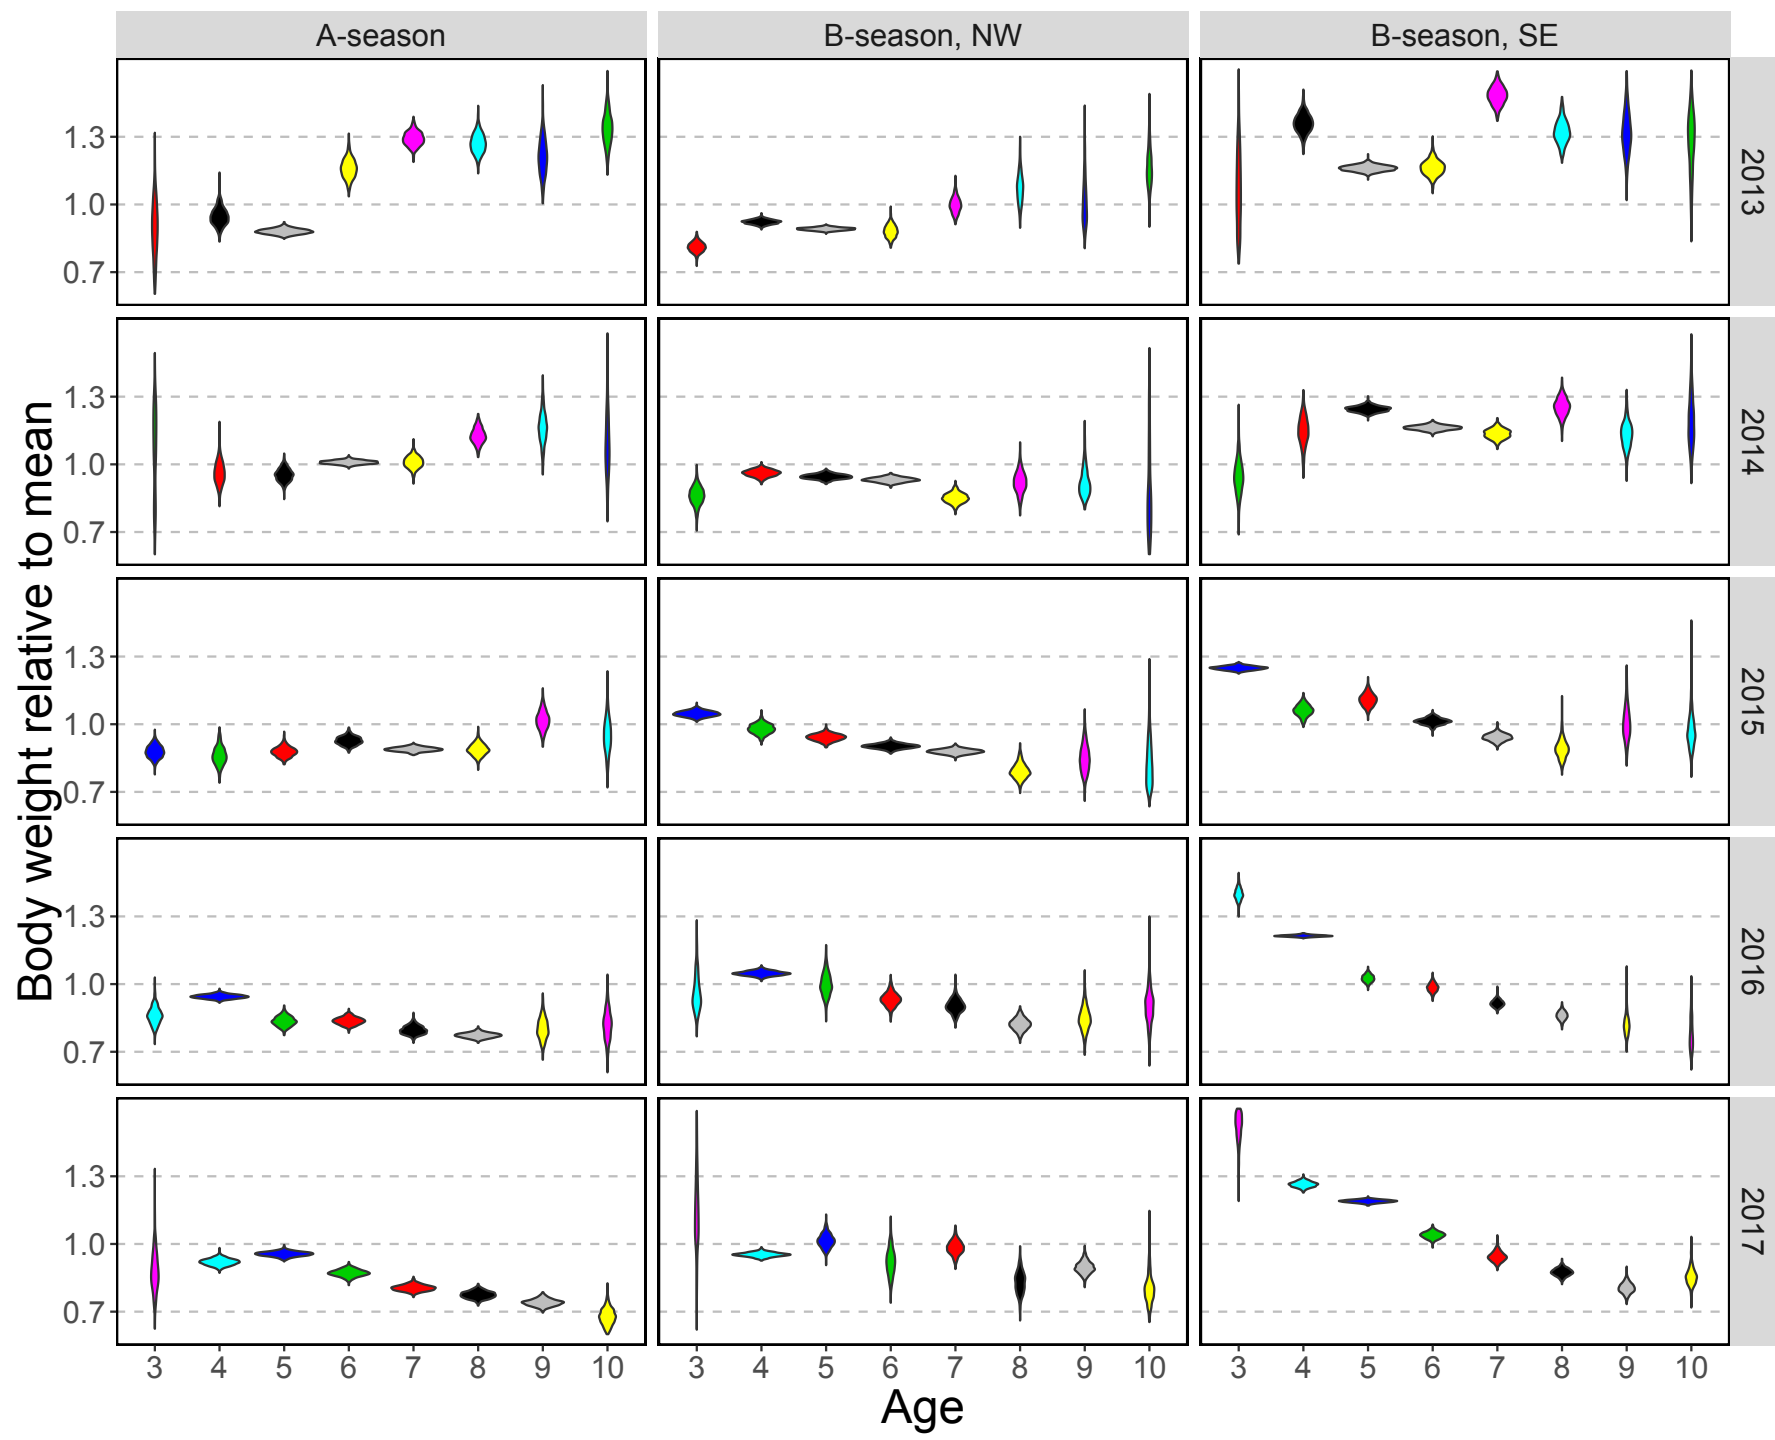

2017

Are pollock smaller at age than normal???

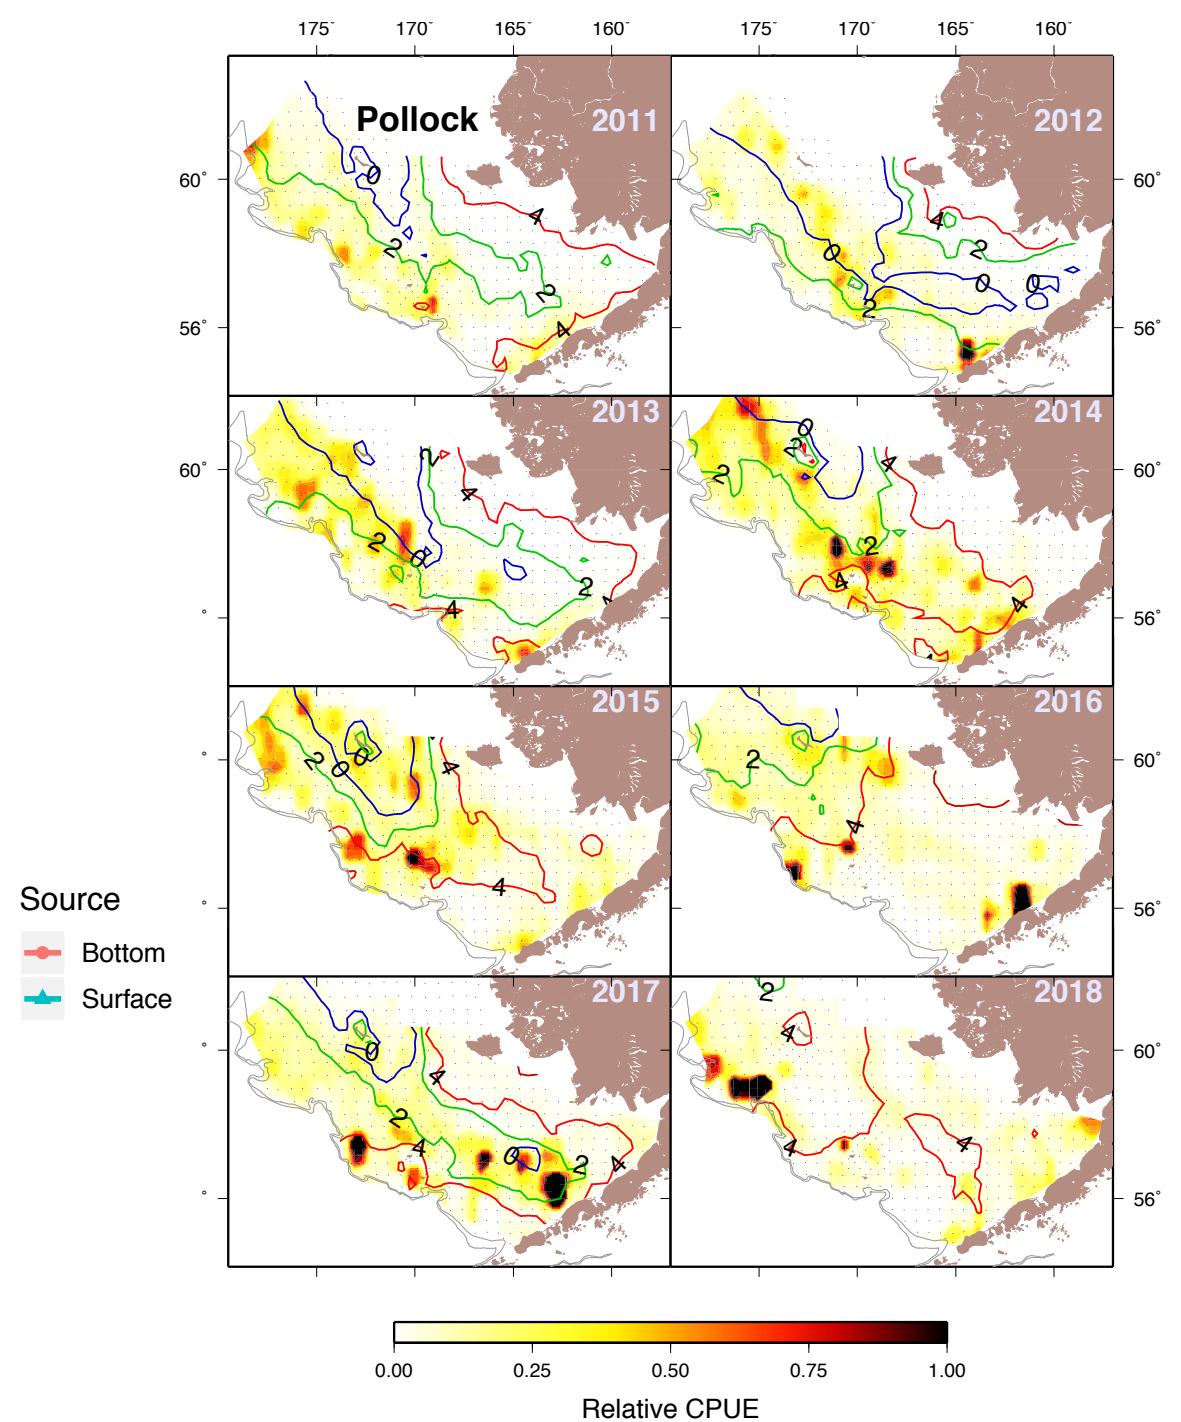

- 2008 year class generally small at age
- 2012 looks better!

- Average fishery weight-at-age by season and year...

Pollock density and temperature

Added survey stations in northern area...

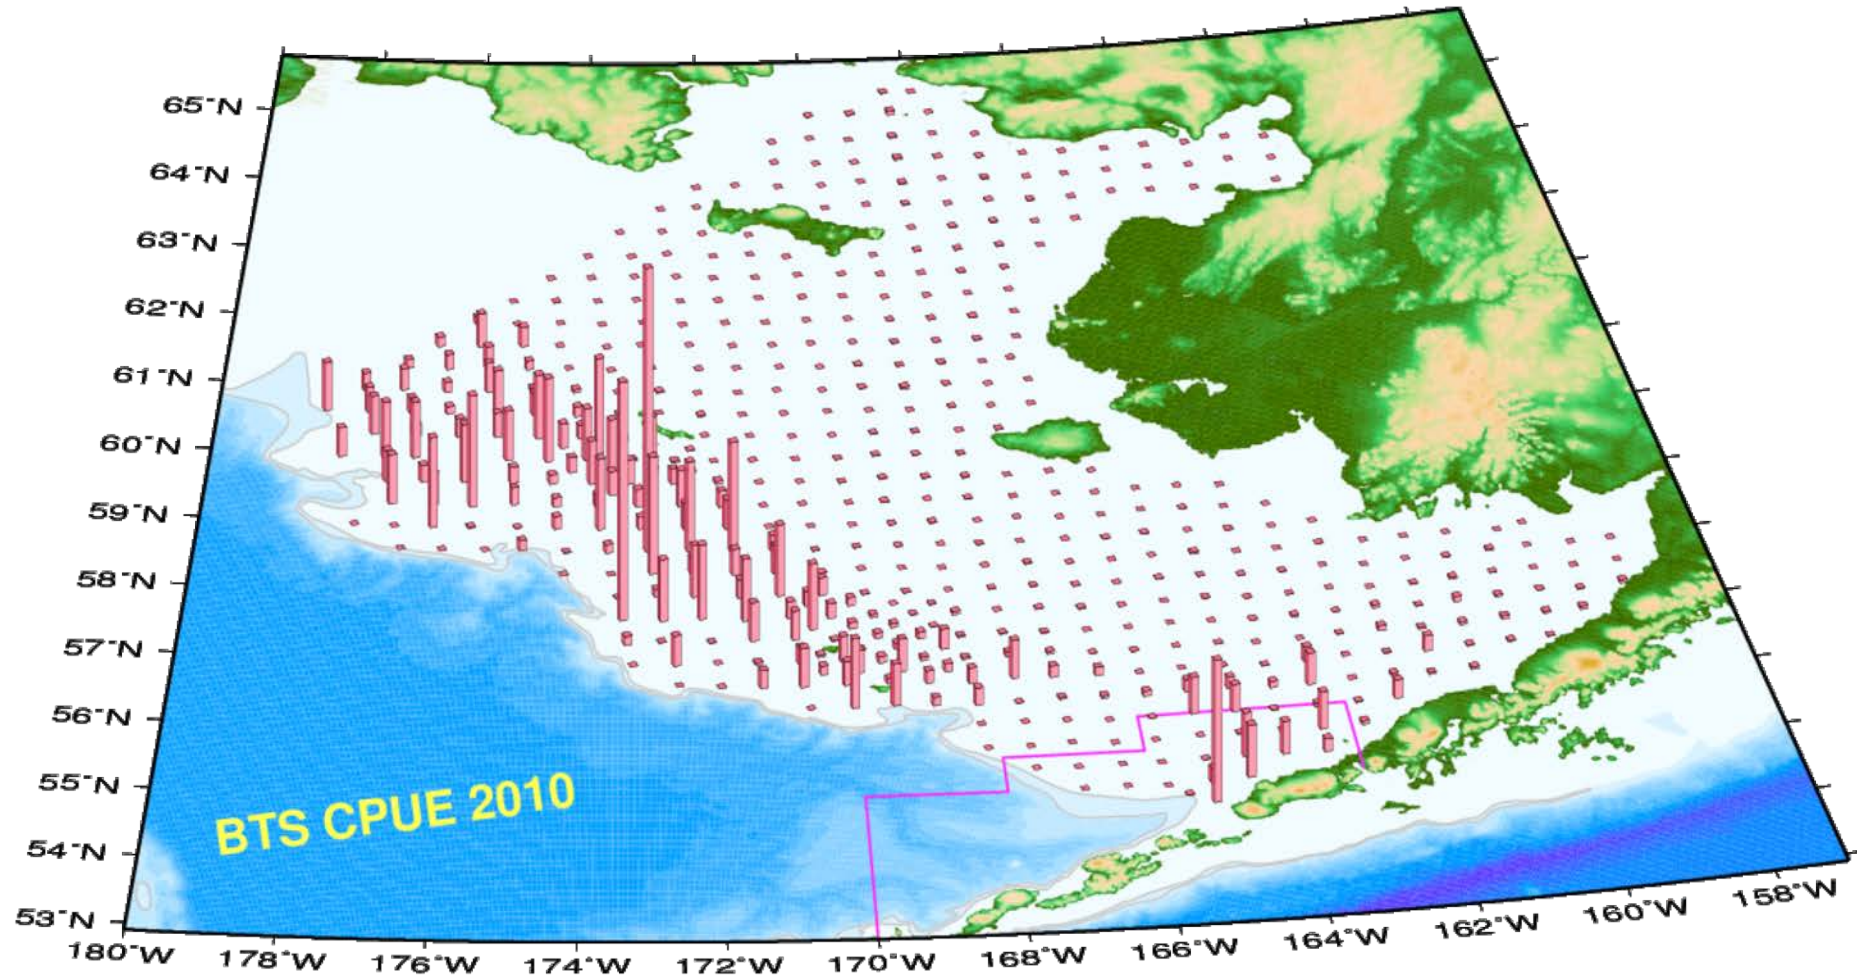

Surveyed in 2010 and 2017

- Extra stations done in 2018 as an “emergency”

Thought to have low abundances of pollock and cod...until 2017

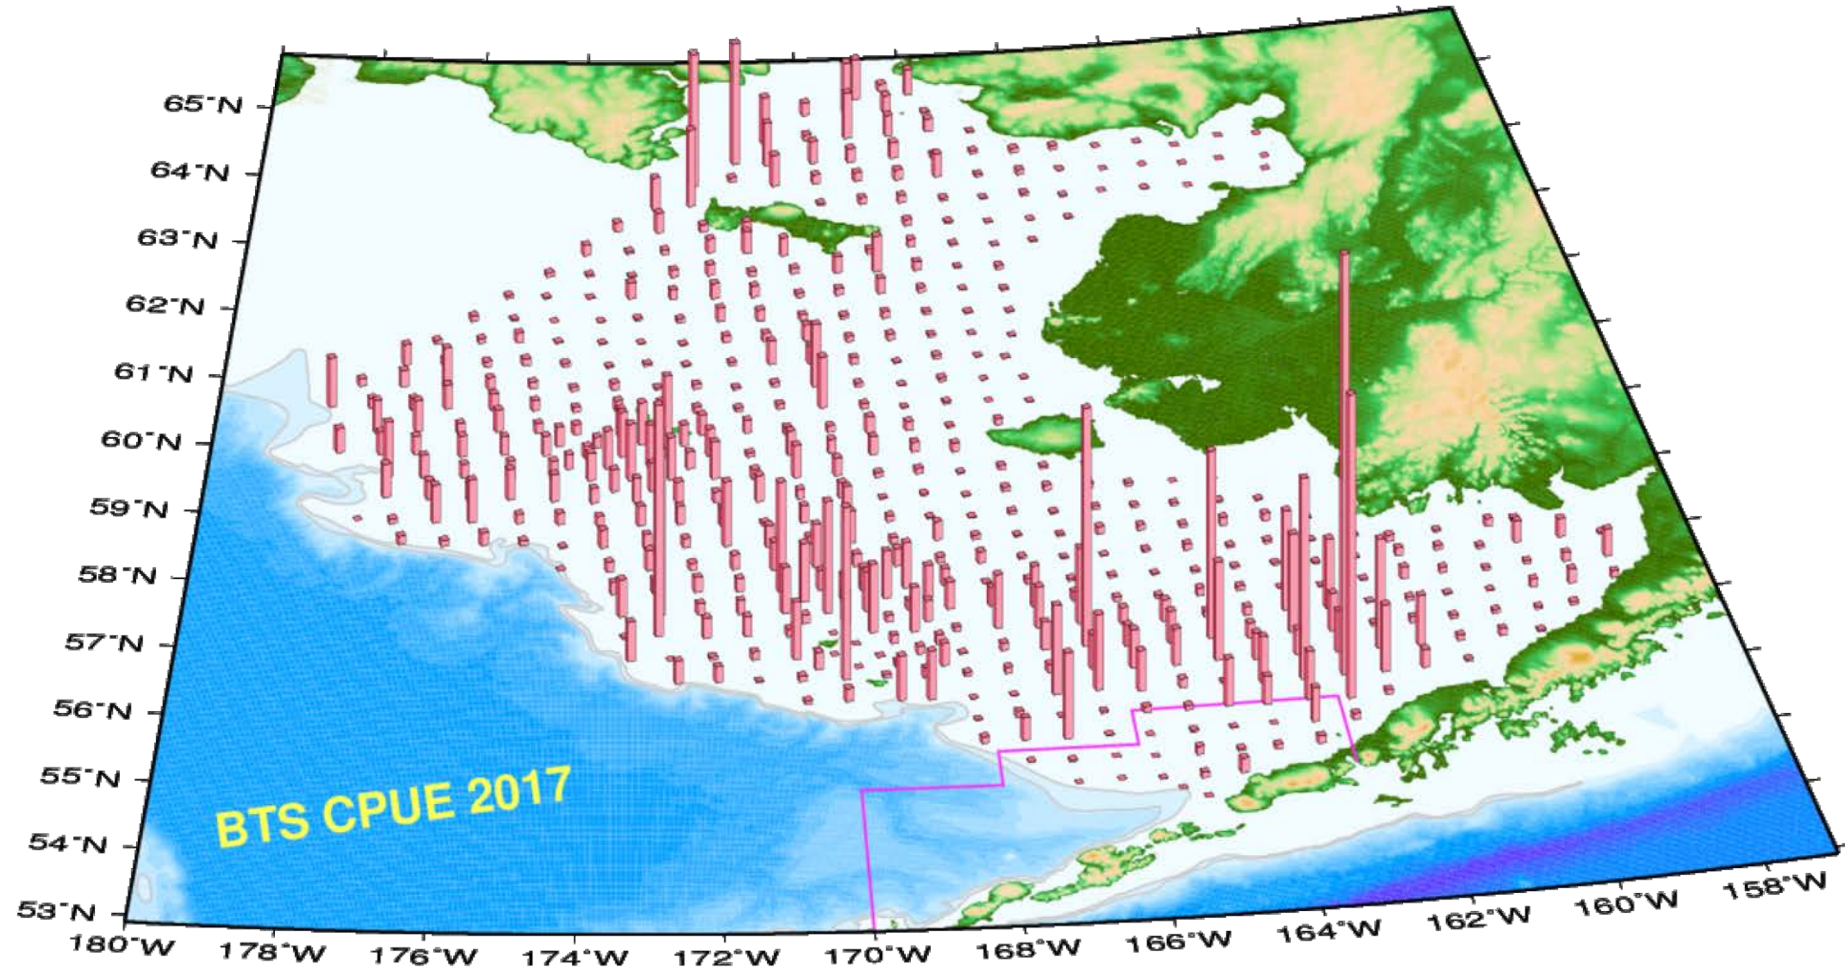

2010 standard survey (3.74 million t pollock estimated)

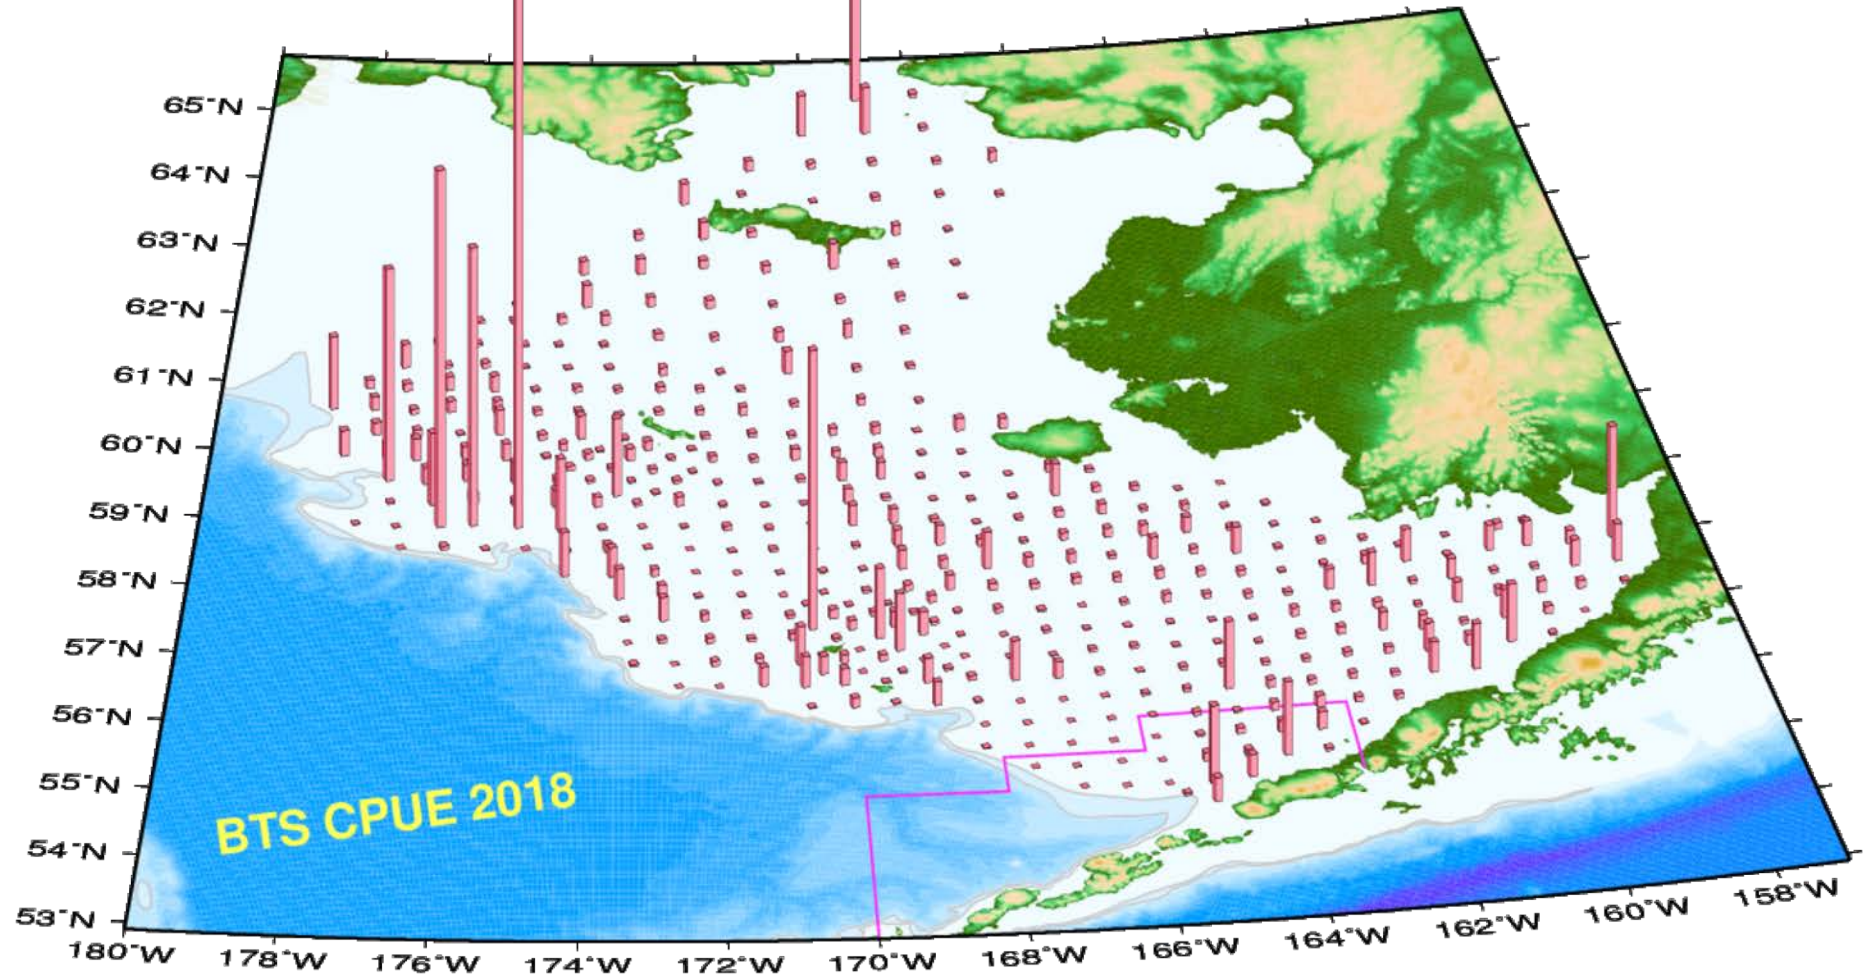

Northern area: trace amounts

2017 standard survey (4.81 million t pollock estimated)

Northern area: 1.34 million t

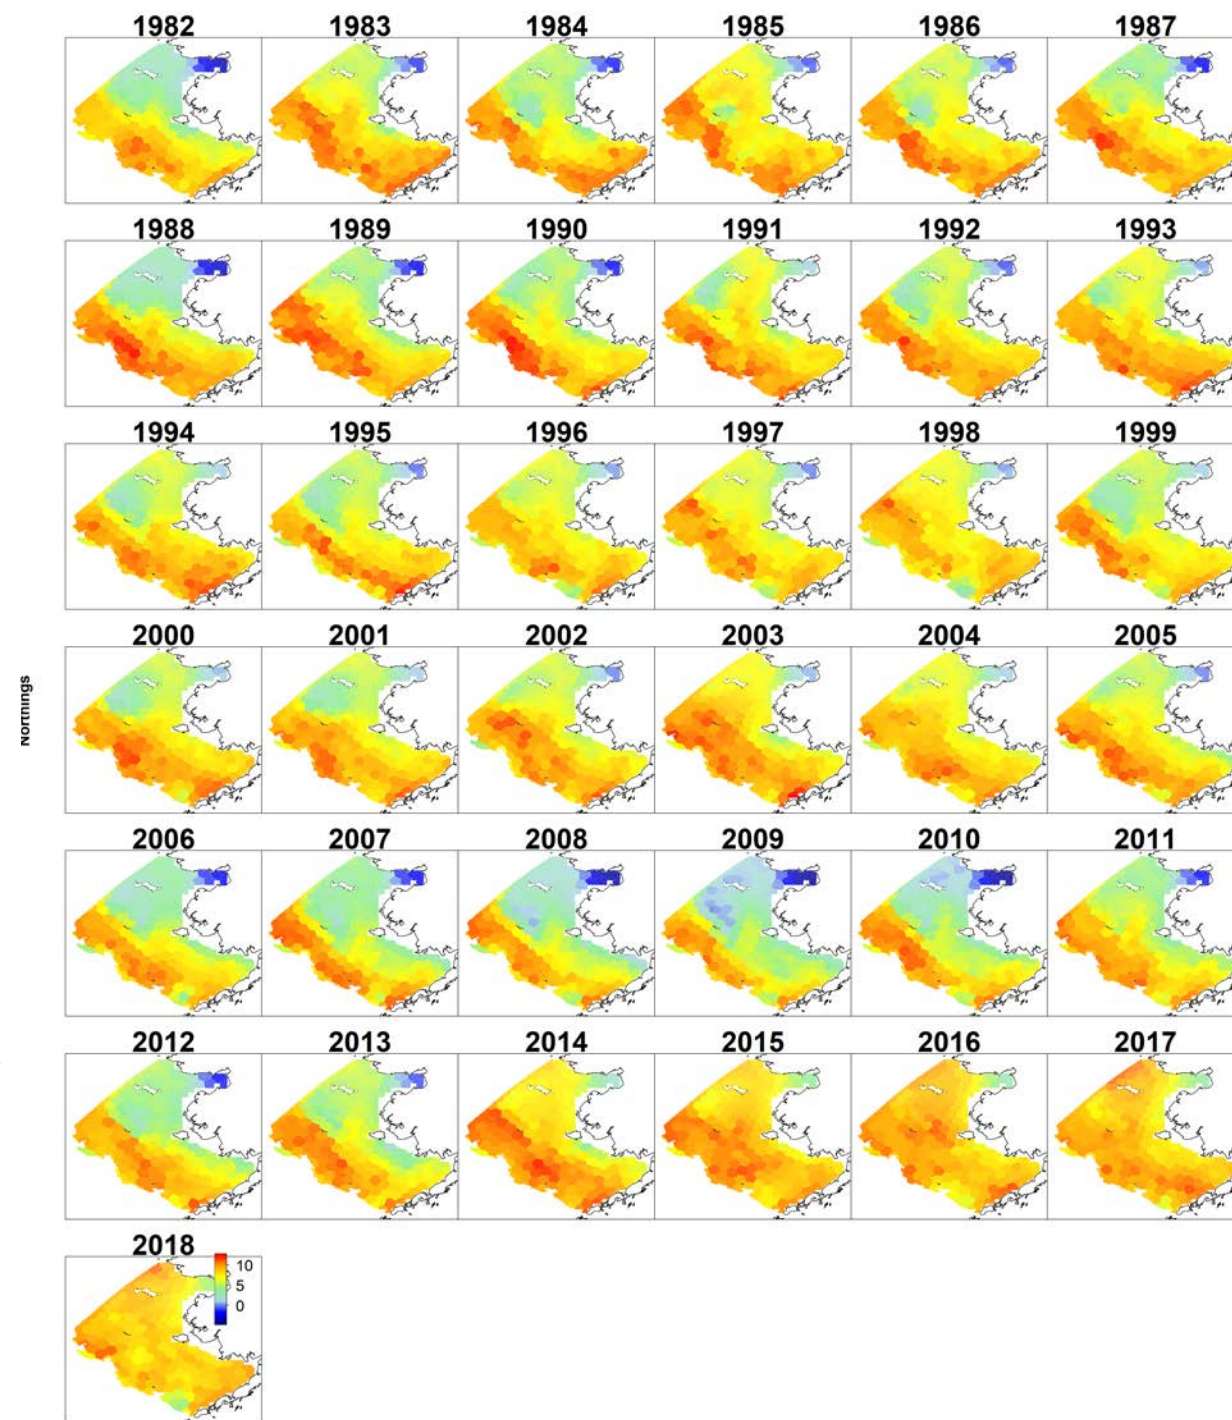

2018 standard survey (3.1 million t pollock estimated)

Northern area: 1.15 million t

EBS pollock Assessment Results

Model details (1 of 2)

- Tuning indices
 - Acoustic Trawl survey
 - Available biennially (usually)
 - Annual fixed-station bottom trawl survey
 - Tested including northern Bering Sea from VASSt
 - Acoustic vessel of opportunity (AVO index)
 - Two new years of data every other year
 - Old foreign trawler CPUE (in 1970s)
- Fishery data
 - Total catch
 - Catch-at-age
 - Mean fishery weights-at-age

Model details (2 of 2)

- Age specific schedules
 - Natural mortality
 - Ages 1 and 2 higher, other ages fixed at 0.3
 - Maturity
 - Fixed, 50% at ~ age 3.5 years
- Other
 - Conditioned on catch biomass (F 's estimated)
 - Selectivity varies in fishery
 - Slightly in surveys
 - Stock recruitment model Ricker, affects ABC values, minimal impact on historical trends
 - Projection options built in to evaluate policy trade offs

Decision table diagnostics included

- Responds to SSC request for fixed future catch
- Relates to realistic future catches
- Allows comparisons with history
 - Less reliance on things like stock-recruit relationship

Table 44: Outcomes of decision (expressed as chances out of 100) given different 2019 catches (first row, in kt). Note that for the 2017 and later year-classes average values were assumed. Constant F's based on the 2019 catches were used for subsequent years.

	10	500	1000	1250	1374	1500	1750	2000

Factors for reducing ABC

		Considerations		
		Assessment-related	Population dynamics	Environmental & ecosystem
Level 1 Normal	Typical to moderately increased uncertainty & minor unresolved issues in assessment	Stock trends are typical for the stock; recent recruitment is within normal range.	No apparent environmental & ecosystem concerns	
Level 2 Substantially increased concerns	Substantially increased assessment uncertainty unresolved issues.	Stock trends are unusual; abundance increasing or decreasing faster than has been seen recently, or recruitment pattern is atypical.	Some indicators showing an adverse signals but the pattern is inconsistent across all indicators.	
Level 3 Major Concern	Major problems with the stock assessment, very poor fits to data, high level of uncertainty, strong retrospective bias.	Stock trends are highly unusual; very rapid changes in stock abundance, or highly atypical recruitment patterns.	Multiple indicators showing consistent adverse signals a) across the same trophic level, and/or b) up or down trophic levels (i.e., predators and prey of stock)	
Level 4 Extreme concern	Severe problems with the stock assessment, severe retrospective bias. Assessment considered unreliable.	Stock trends are unprecedented. More rapid changes in stock abundance than have ever been seen previously, or a very long stretch of poor recruitment compared to previous patterns.	Extreme anomalies in multiple ecosystem indicators that are highly likely to impact the stock. Potential for cascading effects on other ecosystem components	

- Unprecedented warm conditions in 2018 resulted in reduced primary and secondary production
- The cold pool prediction for summer 2019 is for continued warm conditions and reduced cold pool extent
- Weak, delayed phytoplankton bloom, reduced biomass, and reduced energy transfer to upper trophic levels (i.e., zooplankton prey base and juvenile pollock)
- Zooplankton prey base reduced (small, lipid-poor taxa, few euphausiids)
- Adult pollock condition index is negative in both SEBS and NBS and has been trending downwards in SEBS since 2010.
- Unprecedented seabird die-off event and broad reproductive failures indicate, in part, a lack of sufficient prey resources

We therefore rated the Ecosystem concern as Level 2, substantially increased concern.
 These results are summarized as:

Assessment-related	Considerations		Score (max of individual)
	Population dynamics	Environmental or ecosystem	
Level 1: No concern	Level 2: Substantially increased concerns	Level 2: Substantially increased concerns	Level 2: Substantially increased concerns

Fishery effort relative to SSB impact

Projected trend relative to 2018 given future catch=1,350 kt

EBS pollock summary

- Outlook
 - Spawning biomass projected to decline from high levels
 - Decision table may help with TAC considerations

Work plan

- Survey data treatment
 - Joining acoustics with bottom trawl (funded proposal)
 - Refining composition data treatment
 - More AVO work
- New data collection methods
 - Sea-floor mounted echo-sounders
- Genetics work
 - For Bogoslof treatment

Improve management **foresight** in a changing climate

Protect **adaptive capacity** in fish and fisheries

Project changes in Bering Sea ocean conditions and fish populations

Physical, biological, & socioeconomic change; now - 2100

Evaluate how management can adapt to minimize negative impacts of future changes

*gradual change & sudden shocks;
test existing & new tools; estimate risk*

Marine heatwaves will likely increase in frequency and duration

Heatwaves
Now ~ 21% of the time
2050 ~ 30-77% of the time
2100 ~ 60-90% of the time

Duration

Marine heatwave analysis based on downscaled ROMSNPZ hindcast + projections, and 1970-2000 climatology.

ROMSNPZ: K. Kearney, A. Hermann, W. Cheng, K. Aydin, 2018
Heatwave analysis: K. Holsman, 2018, based on Hobday et al. (2016)
Data source: NOAA PMEL, AFSC REEM Program, IEA, MAPP Bering Seasons, ACLIM

Summer Bottom Temperature (°C)

Based on Hermann et al. in review

Downscaling is
needed

Account for trophic
interactions

Mitigation is lower
risk

Adaptation through
fisheries
management

GCMs may underestimate variance in
projections

Accounting for predation changed the
direction of projections from increases (single-
sp model) to declines (multi-sp)

**Most pollock and cod scenarios crashed under
business as usual (RCP8.5) by 2100; carbon
mitigation (RCP 4.5) may lessen or prevent
declines**

**Changing harvest rates through management
can help lessen climate impacts to a point.**
Holsman et al. in prep
**Considering regional management policies is
important.**
