

BSAI Shark Assessments

A large shark is swimming in clear blue water, viewed from above. The shark's body is dark and sleek, with a prominent dorsal fin and a long, pointed tail. The water is a vibrant blue-green color, and there are some white ripples and reflections on the surface. The shark is moving towards the left side of the frame.

BSAI Sharks

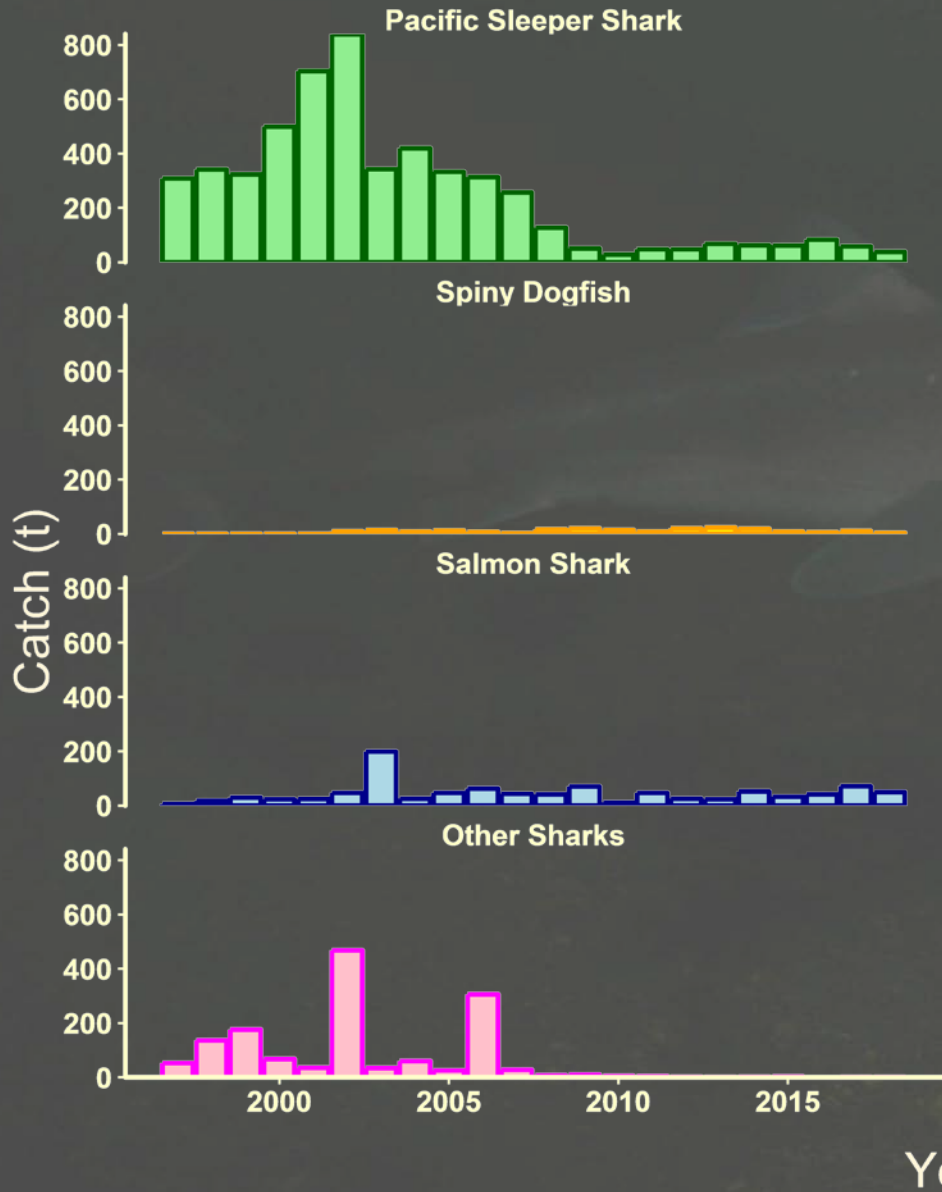

Photo: Doug Perrine, dougperrine.photoshelter.com

- New for 2018:
 - Updated catch data for 2017 and 2018 (as of Oct 9, 2018)
 - Survey data updated
 - Biomass estimates from 2017-2018 AI and EBS shelf surveys
 - RPNs for IPHC longline survey
 - Length data
- No changes to assessment methodology

Responses to PT/SSC Comments

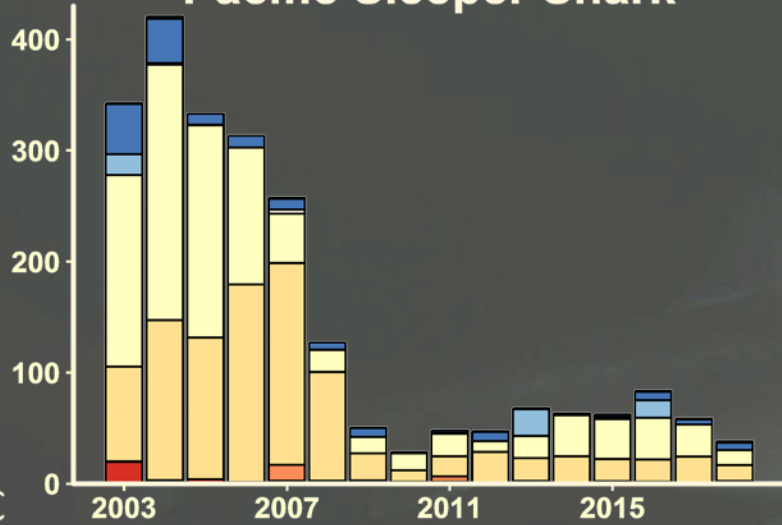

- Major comments (paraphrased):
 - **Develop catch by numbers and examine potential bias in observed longline caught Pacific sleeper sharks (PSS)**
 - *Both are underway, preliminary results of an observer program special project are in Appendix 20.A*
 - **Bring forward options as discussed during [Nov] PT meeting**
 - *Included in Alternative Models*
 - **Examine ageing and data-limited assessment methods**
 - *In progress*

Assessment Methods

Tier 6 Models	OFL	Equation
16.0	Max complex catch 2003–2015	$OFL = \max(C_{2003-2015})$
18.0	Mean catch 2003–2015	$OFL = \bar{C}_{2003-2015}$
18.1	99% upper confidence interval of the mean catch 2003–2015	$OFL = \bar{C}_{2003-2015} + t_{0.01,12} * stdev(\bar{C}_{2003-2015})$
18.2	95% upper confidence interval of the mean catch 2003–2015	$OFL = \bar{C}_{2003-2015} + t_{0.05,12} * stdev(\bar{C}_{2003-2015})$

Model 18.x are results of SSC request to see the “options discussed in the Plan Team (using the 2003-2015 time period)”

ABC and OFL Recommendations

- ABC/OFL set for complex as a whole, not the sum of individual species
- All species are currently Tier 6 (Model 16.0)

ABC and OFL Recommendations

Species	Spiny dogfish	Pacific sleeper shark	Salmon shark	Other/Unidentified shark	Total shark Complex
Maximum Catch	24	421	199	305	689*
Model 16.0 OFL	24	421	199	305	689
Model 16.0 ABC	18	315	149	229	517
Average Catch	14	166	53	38	270
Model 18.0 OFL	14	166	53	38	270
Model 18.0 ABC	10	125	40	28	203
99% Confidence Interval	32	604	196	289	1,122
Model 18.1 OFL	32	604	196	289	1,122
Model 18.1 ABC	24	453	147	216	842
95% Confidence Interval	27	479	155	217	878
Model 18.2 OFL	27	479	155	217	878
Model 18.2 ABC	20	359	116	163	658

Why stick with Status Quo?

- Distribution of catch data are skewed
- Violates assumption of normality, thus mean or any metric based on it is invalid
- Not worth the fuss at this time
 - Catch much lower than any of the alternatives
 - Not going to change behavior
 - Undesirable!!!!
 - DLMs for next assessment

ABC and OFL Recommendations

Quantity	As estimated or specified last year for:		As estimated or recommended this year for:	
	2018	2019	2019	2020
Tier	6	6	6	6
OFL (t)	689	689	689	689
maxABC (t)	517	517	517	517
ABC (t)	517	517	517	517
Status	As determined last year for:		As determined this year for:	
	2016	2017	2017	2018
Overfishing	No	n/a	No	n/a

Questions so far???

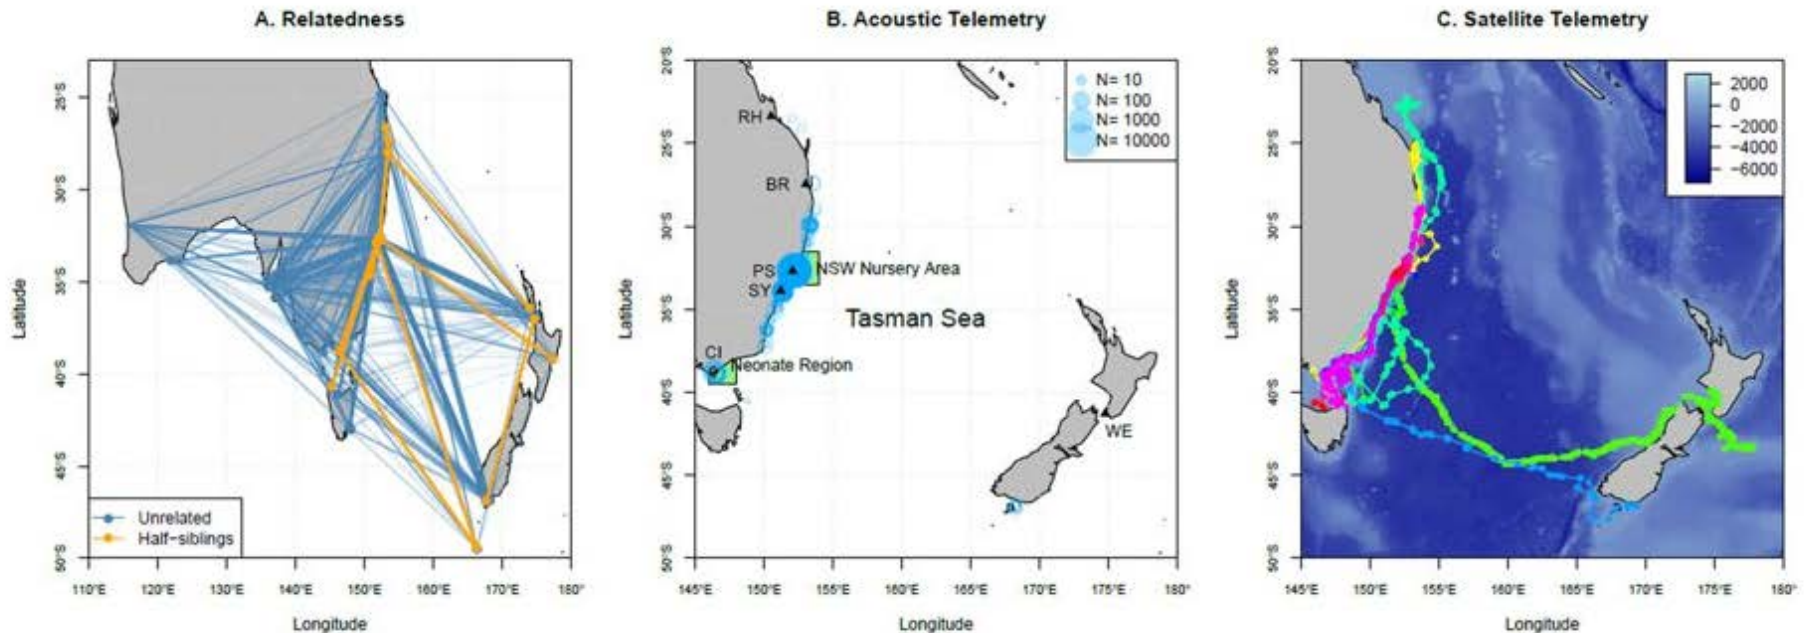

Photo: RACE Survey Team

Outstanding Issues

- Genetic stock structure, close kin mark-recapture
 - Samples have been/are being run in new MiSeq
 - Planning for a PSS stock structure document Sept 2019

Hillary et al. 2018

Outstanding Issues

- Ageing
 - Pilot study underway
 - Samples prepped and ready to send, just waiting PO
 - Reaching out to find faculty with right expertise (bio-chem) to collaborate with
 - Drafting proposals for MS student

Outstanding Issues

- Discard mortality
 - Collaboration with UAF, ASLC and (hopefully) industry (I need to talk to you folks!)
 - Drafting co-op research proposal
 - MS student at UAF

<https://60nscience.alaskasealife.org>

Outstanding Issues

- Catch by numbers
 - Working with the AKRO staff to get numbers back to 2003
 - Should be available for next full assessment!!!
- Data-limited methods
 - Should be available for next full assessment

Outstanding Issues

- Unobserved catch in state fisheries
 - Could be a significant source of removals
