EBS pollock Assessment Results

Data

The following lists the data used in this assessment:

| Source | Type | Years |
|---------------------------------------|---|---|
| Fishery | Catch biomass | 1964–2020 |
| Fishery | Catch age composition | 1964–2019 |
| Fishery | Japanese trawl CPUE | 1965–1976 |
| EBS bottom trawl | Area-swept biomass and age-specific proportions | 1982–2019 |
| Acoustic trawl survey | Biomass index and age-specific proportions | 1994, 1996, 1997, 1999, 2000, 2002, 2004, 2006–2010, 2012, 2014, 2016, 2018, 2020 |
| Acoustic vessels of opportunity (AVO) | Biomass index | 2006–2019 |

Note the 2020 acoustic survey data based on unmanned surface vessel (USV) transects

Model details (1 of 2)

- Tuning indices
 - Acoustic Trawl survey
 - Available biennially (**usually!!**)
 - Annual fixed-station bottom trawl survey (**normally**)
 - Acoustic vessel of opportunity (AVO index)
 - **Normally** Two new years of data every other year
 - Old foreign trawler CPUE (in 1970s)
- Fishery data
 - Total catch
 - Catch-at-age
 - Mean fishery weights-at-age

Model details (2 of 2)

- Age specific schedules
 - Natural mortality
 - Ages 1 and 2 higher, other ages fixed at 0.3
 - Maturity
 - Estimated externally...50% at ~ age 3.5 years
- Other
 - Conditioned on catch biomass (F 's estimated)
 - Selectivity varies in fishery
 - Slightly in surveys
 - Stock recruitment model Ricker,
 - Affects ABC values, minimal impact on historical trends
 - Projection options built in to evaluate policy trade offs

Applying survey data in assessment model

Model configurations

- Base (as in 2019)
 - Model 16.2
- Extend acoustic time series with drone data
 - As biomass converted from 2020 back-scatter
 - (Model 20.0)
- Analyze all historical data from research vessels combined with the 2020 drone data
 - All data treated as acoustic back-scatter
 - Uses VAST model for modeling unbalanced data (spatio-temporal aspects)
 - (Model 20.1)

Data Impact on Model

New data impact on model...

Data considerations

| Name | Updated catch to 2020 | 2019 fishery age data | 2020 Drone biomass (design based) | 2020 Drone backscatter (VAST) |
|----------------|-----------------------|-----------------------|-----------------------------------|-------------------------------|
| Catch | X | | | |
| + Age Fishery | X | X | | |
| + Drone (DB) | X | X | X | |
| + Drone (VAST) | X | X | | X |

Data
Impact on
Model

Selected model with USV for management advice

- Converted to biomass (in 2020)
- Similar to results from VAST
 - Was only backscatter

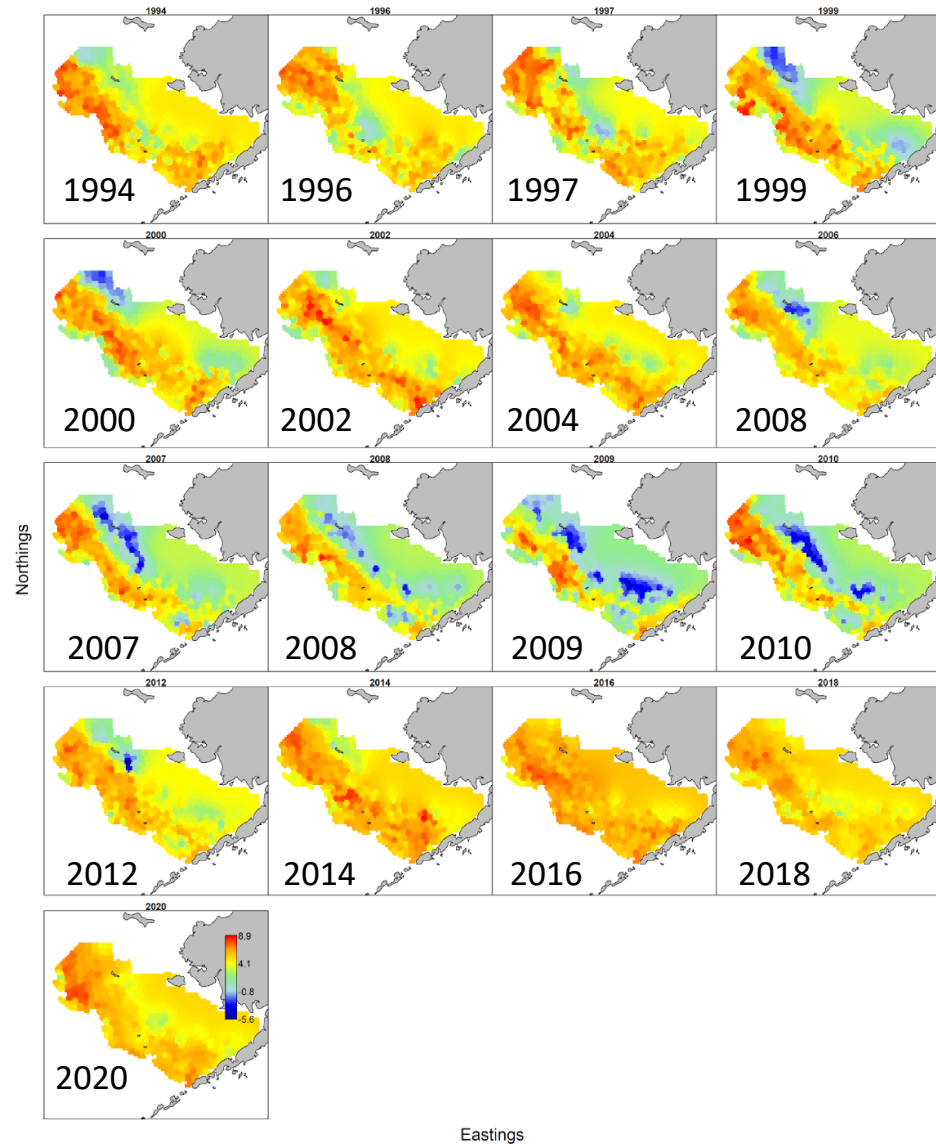

Figure 19: VAST model predicted log-density of pollock abundance based on acoustic backscatter from NMFS acoustic-trawl surveys (1994–2018) and from the 2020 USV transects.

Results

Estimated recruitment

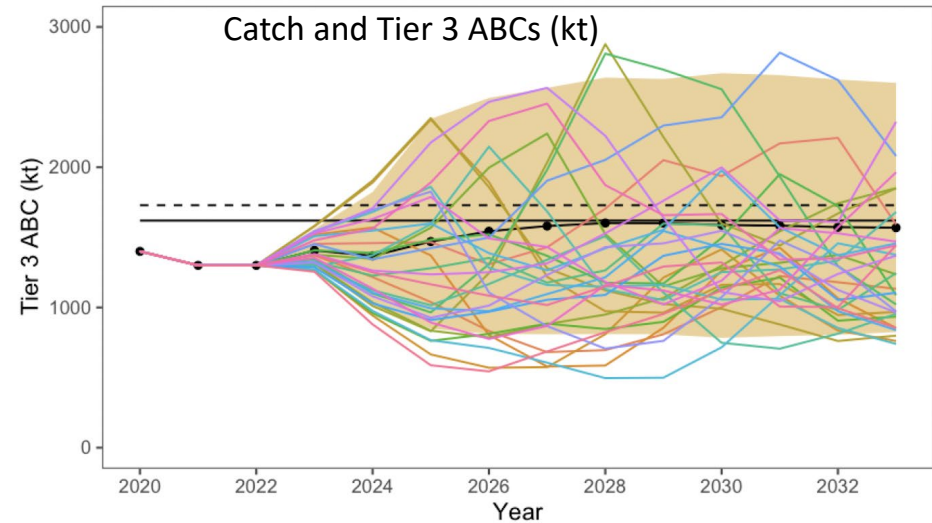

Projections

Cautions:

- Current absolute biomass uncertain
- Future weight-at-age may add uncertainty
- Actual year-year fluctuations in catch unrealistic

assumptions...

“Tier 3” Stock-recruit relationship

Factors for reducing ABC

| | Considerations | | | |
|---|---|--|--|--|
| | Assessment-related | Population dynamics | Environmental & ecosystem | Fishery performance |
| Level 1 Normal | Typical to moderately increased uncertainty & minor unresolved issues in assessment | Stock trends are typical for the stock; recent recruitment is within normal range. | No apparent environmental & ecosystem concerns | No apparent fishery/resource-use performance and/or behavior concerns |
| Level 2 Substantially increased concerns | Substantially increased assessment uncertainty unresolved issues. | Stock trends are unusual; abundance increasing or decreasing faster than has been seen recently, or recruitment pattern is atypical. | Some indicators showing an adverse signals but the pattern is inconsistent across all indicators. | Some indicators showing adverse signals but the pattern is inconsistent across all indicators. |
| Level 3 Major Concern | Major problems with the stock assessment, very poor fits to data, high level of uncertainty, strong retrospective bias. | Stock trends are highly unusual; very rapid changes in stock abundance, or highly atypical recruitment patterns. | Multiple indicators showing consistent adverse signals a) across the same trophic level, and/or b) up or down trophic levels (i.e., predators and prey of stock) | Multiple indicators showing consistent adverse signals a) across different sectors, and/or b) different gear types |
| Level 4 Extreme concern | Severe problems with the stock assessment, severe retrospective bias. Assessment considered unreliable. | Stock trends are unprecedented. More rapid changes in stock abundance than have ever been seen previously, or a very long stretch of poor recruitment compared to previous patterns. | Extreme anomalies in multiple ecosystem indicators that are highly likely to impact the stock. Potential for cascading effects on other ecosystem components | Extreme anomalies in multiple performance indicators that are highly likely to impact the stock. |

Summary for Environmental/Ecosystem considerations

- The eastern Bering Sea returned to near-normal climatic conditions in 2020;
- Sea ice extent exceeded the historical median in parts of February and March 2020;
- Ice thickness was low and retreated quickly in spring 2020;
- The spatial extent of the cold pool was average;
- The eastern Bering Sea is experiencing a persistent warm stanza, greater in both magnitude and duration than that of the early 2000s;
- The 2019 year class experienced unfavorable temperature conditions from age-0 to age-1 and is predicted to have below-average recruitment to age-4 in 2023.
- Winter 2019/2020 had an average wind speed direction (north/south) near the long-term average;
- The 2020 springtime drift pattern was mixed indicating larvae may have been retained over the southern middle shelf;
- The spring bloom over the southern shelf occurred about a week earlier than the long-term mean;
- Chlorophyll concentrations over the southern shelf have been below the long-term mean since 2016;
- Low abundance of large copepods during late-summer in 2017-2019 indicate poor overwinter survival and recruitment to age-3 in 2020-2022;
- Condition (weighted length-weight residuals) of juvenile pollock (100-250 mm TL) in 2019 was at the long-term mean indicating moderate foraging conditions;
- Condition of adult pollock (>250 mm TL) in 2019 was above-average indicating good foraging conditions (including cannibalism of juvenile pollock);
- Predation pressure from cannibalism may have been mitigated by the average spatial extent of the cold pool (i.e., thermal barrier);
- The decoupling of abundance timeseries for Pacific cod and walleye pollock suggests a shift in drivers of survival in these two populations and may indicate broad-scale transitions in the ecosystem (e.g., from pelagic- to benthic-dominated production);
- The widespread die-off event of short-tailed shearwaters slowed in 2020 and may reflect better feeding conditions (i.e., euphausiids) over the shelf in 2019.

Risk table

- Ecosystem and fishery performance score of 2

| Assessment- related | Considerations | | |
|------------------------|------------------------|--|--|
| | Population dynamics | Environmental or ecosystem | Fisheries |
| Level 1: No concern | Level 1: No concern | Level 2: Substantially increased concerns | Level 2: Substantially increased concerns |

Table 47: Details and explanation of the decision table factors selected in response to the Plan Team requests (as originally proposed in the 2012 assessment).

| Term | Description | Rationale |
|----------------------------------|--|--|
| $P [F_{2021} > F_{MSY}]$ | Probability that the fishing mortality in 2021 exceeds F_{MSY} | OFL definition is based on F_{MSY} |
| $P [B_{2022} < B_{MSY}]$ | Probability that the spawning biomass in 2022 is less than B_{MSY} | B_{MSY} is a reference point target and biomass in 2021 provides an indication of the impact of 2021 fishing |
| $P [B_{2023} < B_{MSY}]$ | Probability that the spawning biomass in 2023 is less than B_{MSY} | B_{MSY} is a reference point target and biomass in 2023 provides an indication of the impact of fishing in 2021 and 2022 |
| $P [B_{2023} < \bar{B}]$ | Probability that the spawning biomass in 2022 is less than the 1978–2020 mean | To provide some perspective of what the stock condition might be relative to historical estimates after fishing in 2021. |
| $P [B_{2025} < \bar{B}]$ | Probability that the spawning biomass in 2025 is less than the long term mean | To provide some perspective of what the stock condition might be relative to historical estimates after fishing in 2021. |
| $P [B_{2025} < B_{2021}]$ | Probability that the spawning biomass in 2025 is less than that estimated for 2021 | To provide a medium term expectation of stock status relative to 2021 levels |
| $P [B_{2023} < B_{20\%}]$ | Probability that the spawning biomass in 2023 is less than $B_{20\%}$ | $B_{20\%}$ had been selected as a Steller Sea Lion lower limit for allowing directed fishing |
| $P [p_{a5,2023} > \bar{p}_{a5}]$ | Probability that in 2023 the proportion of age 1–5 pollock in the population exceeds the long-term mean | To provide some relative indication of the age composition of the population relative to the long term mean. |
| $P [D_{2022} < D_{1994}]$ | Probability that the diversity of ages represented in the spawning biomass (by weight) in 2022 is less than the value estimated for 1994 | To provide a relative index on the abundance of different age classes in the 2022 population relative to 1994 (a year identified as having low age composition diversity) |
| $P [D_{2025} < D_{1994}]$ | Probability that the diversity of ages represented in the spawning biomass (by weight) in 2025 is less than the value estimated for 1994 | To provide a medium-term relative index on the abundance of different age classes in the population relative to 1994 (a year identified as having low age composition diversity) |
| $P [E_{2021} > E_{2020}]$ | Probability that the theoretical fishing effort in 2021 will be greater than that estimated in 2020. | To provide the relative effort that is expected (and hence some idea of costs). |

- Decision table explanation

(Table 47)

Decision table diagnostics included

Table 48: Outcomes of decision (expressed as chances out of 100) given different 2021 catches (first row, in kt). Note that for the 2018 and later year-classes average values were assumed. Constant F s based on the 2021 catches were used for subsequent years.

| | 10 | 850 | 1000 | 1150 | 1350 | 1300 | 1450 | 1600 |
|------------------------------------|----|-----|------|------|------|------|------|------|
| $P [F_{2021} > F_{MSY}]$ | 0 | 1 | 5 | 13 | 29 | 25 | 36 | 47 |
| $P [B_{2022} < B_{MSY}]$ | 14 | 28 | 32 | 35 | 41 | 39 | 44 | 48 |
| $P [B_{2023} < B_{MSY}]$ | 8 | 23 | 27 | 32 | 39 | 37 | 43 | 49 |
| $P [B_{2022} < \bar{B}]$ | 34 | 84 | 89 | 93 | 96 | 96 | 97 | 98 |
| $P [B_{2025} < \bar{B}]$ | 4 | 28 | 35 | 41 | 50 | 48 | 54 | 60 |
| $P [B_{2025} < B_{2021}]$ | 3 | 19 | 23 | 28 | 34 | 33 | 38 | 42 |
| $P [B_{2023} < B_{20\%}]$ | 0 | 1 | 1 | 1 | 2 | 2 | 2 | 3 |
| $P [p_{a_5,2023} > \bar{p}_{a_5}]$ | 20 | 66 | 72 | 76 | 81 | 80 | 83 | 85 |
| $P [D_{2022} < D_{1994}]$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $P [D_{2025} < D_{1994}]$ | 0 | 4 | 5 | 8 | 12 | 11 | 14 | 19 |
| $P [E_{2021} > E_{2020}]$ | 0 | 4 | 22 | 47 | 74 | 69 | 82 | 90 |

EBS pollock summary

- Outlook
 - Spawning biomass declining
 - From high levels
 - Fishing challenges ~~likely to~~ **have** increased
 - Recommend stabilization of effort
 - ***ABC > 1.2 million t means likely more effort than 2020***
 - Stock projected to drop below B_{msy} by 2021
 - could affect 2021 ABC (and TAC)
