GOA assessment Overview

“On” year for GOA, NMFS bottom trawl survey occurred!

15 “full” assessments reviewed

4 “partial” assessments

Ecosystem Considerations summary

Western Gulf of Alaska 2021 Report Card

- The PDO continued its negative trend in 2021, reflecting cooling sea surface temperatures in the GOA.
- Summer (June-August) 2021 sea surface temperatures in the western GOA were generally lower than 2020, although spring surface temperatures were elevated.
- Mesozooplankton biomass (sampled April-Sept) decreased in 2020, indicating average foraging conditions for planktivorous predators.
- Copepod community size slightly increased in 2020 (sampled April-Sept) indicating there were slightly more large species available (often considered of higher nutritional quality).
- Motile epifauna biomass, observed during 2021 AFSC bottom trawl survey (May-Aug), decreased from 2019 to 2021.
- Trends in capelin, as sampled by rhinoceros auklets at Middleton Island (April-Aug.), continue to be minimal in seabird chick diets in recent years.
- Fish apex predator biomass, observed during 2021 AFSC bottom trawl survey (May-Aug), increased from 2019 to 2021 to within just above 1SD below the long-term mean.
- Black-legged kittiwakes reproductive success in 2021 (June-July) increased from 2020.
- Modelled estimates of western Gulf of Alaska Steller sea lion non-pup counts continued a slightly increasing trend from previous years; however realized counts for non-pups show the lowest values in this area since 2011.

Ecosystem Considerations summary

Eastern Gulf of Alaska 2021 Report Card

- La Nina conditions prevailed in winter 2020/2021 and are predicted for winter 2021/2022.
- Summer (June-Aug.) 2021 sea surface temperatures in the eastern GOA remain within 1SD of the long-term mean.
- Total zooplankton density in SEAK inside waters (May-Aug) increased from 2020, suggesting improved foraging conditions for planktivorous fish, seabirds, and mammals.
- The overall copepod community size (ratio of large calanoid copepods to total calanoid copepods) decreased due to decreased densities of large copepods and increased densities of small copepods.
- Motile epifauna biomass, observed during 2021 AFSC bottom trawl survey (May-Aug), decreased from 2019 to 2021. Hermit crabs, brittle stars, and other echinoderms are all below their long-term means. Eelpouts have also decreased from 2019 to 2021.
- Estimated total mature herring biomass (age 3+) of Sitka herring in spring 2020 continued to increase to the largest value in the time series (since 1980). The two populations with ocean influence (Sitka Sound and Craig) were elevated while populations in SEAK inner waters and Prince William Sound increased but remained low.
- Fish apex predator biomass, observed during 2021 AFSC bottom trawl survey, trended downward from a high in 2015 to their second lowest value over the time series in 2021. The decrease over this time period has largely been driven by Arrowtooth flounder which are at their lowest value over the time series. Pacific halibut, sablefish, and Pacific cod, have all increased from 2019.
- Growth rates of piscivorous rhinoceros auklet chicks remain below the long-term mean in 2021 (June-July), a pattern since 2015, suggesting that the adults were unable to find sufficient prey to support optimal chick growth.
- Modelled estimates of eastern Gulf of Alaska Steller sea lion non-pup counts continue an increasing trend. However, counts suggest that non-pup have been lower than predicted in 2019 and 2017.

Ecosystem Considerations summary

SAFE introduction also included summaries on

- Regional Action Plan (RAP)
- Climate Integrated Modeling (GOACLIM) project

GOA Pollock Data

GOA Pollock

2021 was “on” year for surveys in the GOA

2021 biomass estimates:

Shelikof acoustic: 527 kt, **15% increase** from 2020.

Summer acoustic: 431 kt, **26% decrease** from 2019

NMFS bottom trawl: 494 kt, **92% increase** from 2019

ADF&G bottom trawl: 65 kt, **9% increase** from 2020

GOA Pollock surveys

1. GOA pollock apportionment

Area	TAC (t)		Percent	
	Season A	Season B	Season A	Season B
610	1,138	22,582	0.9%	17.4%
620	52,313	16,946	40.3%	13.1%
630	8,065	21,988	6.2%	16.9%
640	6,722		5.2%	

Minor change in % season and area apportionment from 2020

1. GOA pollock overview

Changes to the assessment model

- None

Author's 2022 ABC 133,081 t

- Increase of 26%

Concerns:

- Conflict in size of 2018 year class
- Weight-age
- Survey catchability assumptions

Positives:

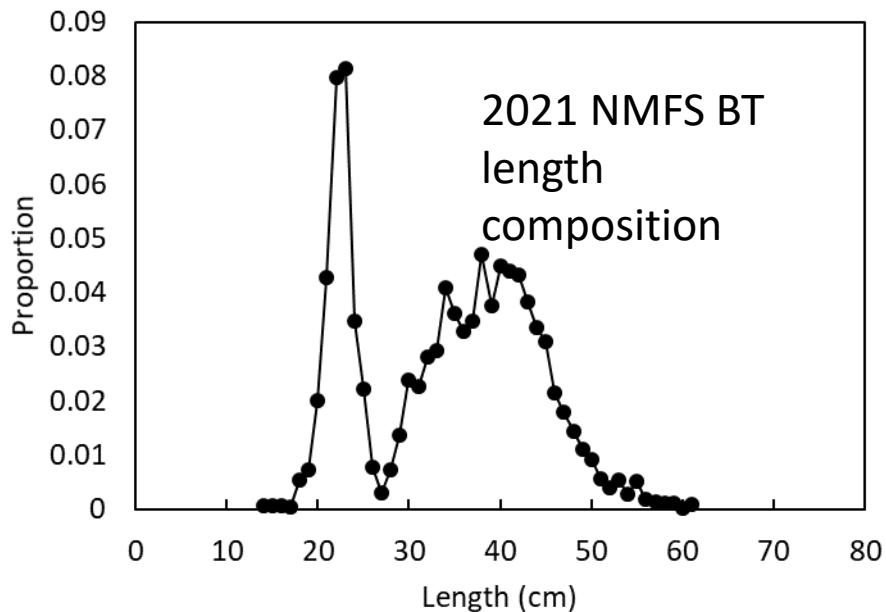

- Return to normal age diversity w/ decline in 2012 cohort
- Indications of abundant 2020 year class
- Environmental conditions favorable

Pollock in SE Alaska (separate ABC)

- Tier 5 model used for East Yakutat and SE.
- RE model fitted to biomass estimates from NMFS BT.
- $M=0.3$ assumed.
- $ABC=11,363$ t for 2022 and 2023

Team discussions—GOA pollock

Relative to weight-at-age changes in data

The Team recommends that the methodologies for projecting weight at age from the survey data be investigated, possibly by implementing a random-effects model or a sample weighted mean approach rather than a simple average

Regarding NMFS Bottom trawl survey catchability:

The Team recommends the author further research this issue, including conducting a prior sensitivity analysis and potentially looking at applying priors (if available) for other surveys in the assessment.

The Team supported the authors' planned research into these topics and agreed their relative priority.

Rock sole assessments

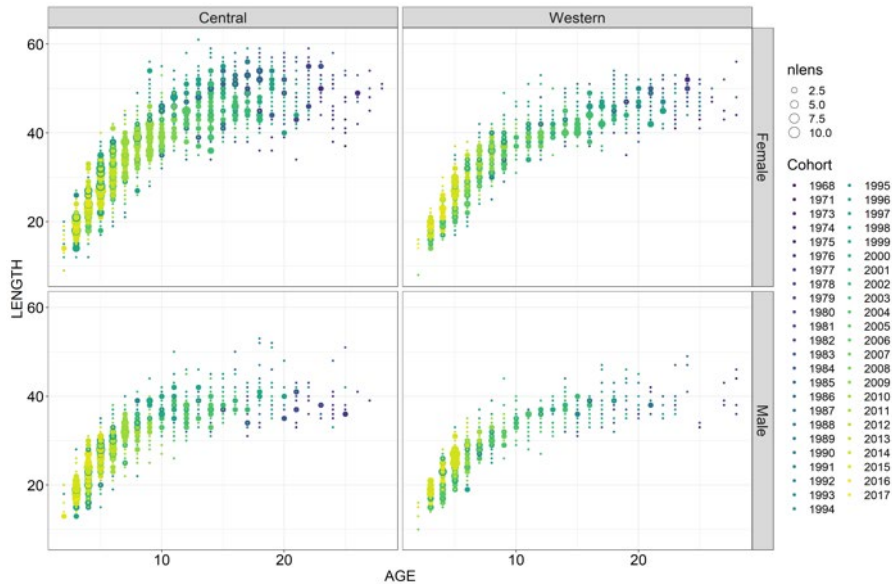

Northern rock sole

Differences in growth by area

2-area model accounts for differences in growth between central and western GOA

Southern rock sole

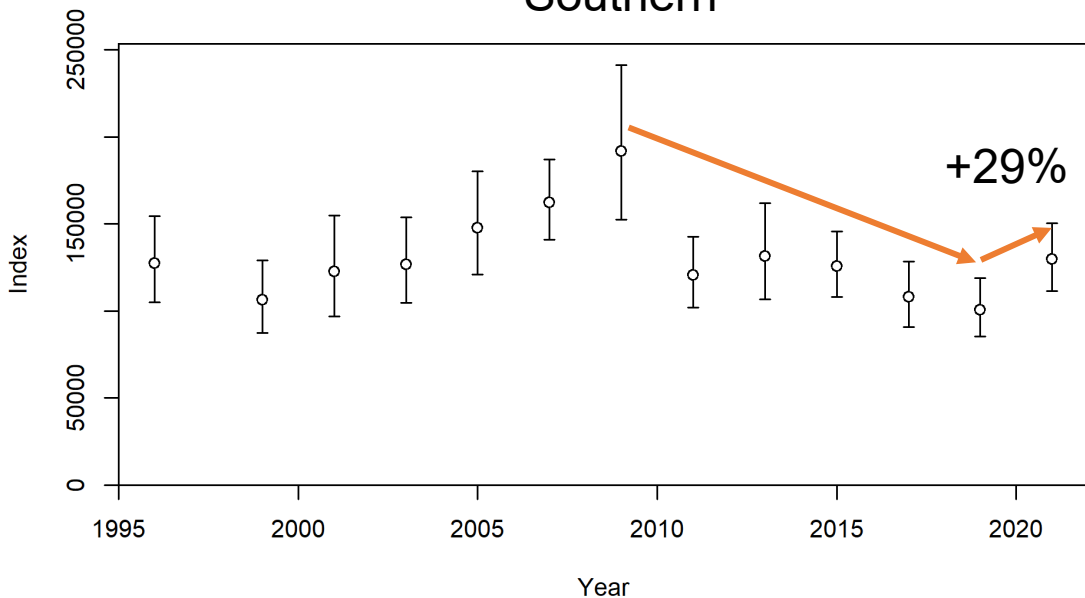

Rock soles survey biomass

Northern

Southern

Summary–northern rock sole

- Overall fits to data were similar among the models
 - Some improvement in the fit to survey biomass by 2-area model
 - Indications of non-stationarity for all models
 - All models underestimate peak of male length distribution from survey
- Retrospective results were similar among models
- Preferred model – Model 21.2
 - Biologically appropriate given difference in growth between central and western GOA
 - Estimated growth of central GOA growth morph better described
 - Majority of catch is from central GOA
 - Important for estimating reference points

The Team agreed with this choice

Flatfish ABC's

Species	2021 ABC	2022 ABC	Change
Shallow water flatfish	56,164	50,610	down 5,554 (10%)
Rex sole	15,416	19,141	up 3,725 (24%)
Deep water flatfish	5,926	5,908	down 18 (0%)
Flathead sole	39,377	40,175	up 798 (2%)
Arrowtooth flounder	126,970	119,779	down 7,191 (6%)
Subtotal	243,853	235,613	down 8,240 (3%)
Subtotal (without ATF)	116,883	115,834	down 1,049 (1%)

7. Arrowtooth flounder

- Full assessment in odd years
 - Tier 3
 - New catch, survey, age/length comps, no model changes

7. Arrowtooth flounder

7. Arrowtooth flounder

- Plan Team discussions
 - Agreed with recommended ABC/OFL
- Noted research topics:
 - Investigate lack of fit in female survey age and fishery length compositions, (differential female natural mortality)
 - Consider GOA CEATTLE model (G. Adams), include efforts to streamline data pulls and processing between single and multi-species models
 - Re-examine growth assumptions, update age-length conversion matrices, consider alternative surveys and VAST estimates

13. GOA Blackspotted/Rougheye Rockfish

13. GOA Blackspotted/Rougheye Rockfish

Plan Team discussions

- Team agreed with author-recommended, noting consistency with available data
- The Team noted that the estimated dome shape of the selectivity should be evaluated in the future.
- The Team agreed with the data and model issues raised by the author including:
 - data weighting,
 - trawl survey length data,
 - survey index refinements, and
 - parameterizations for survey catchabilities and selectivities.
- The Team continued to place a high priority on developing robust **species identification methods** and in estimating composition data.

16. Other rockfish

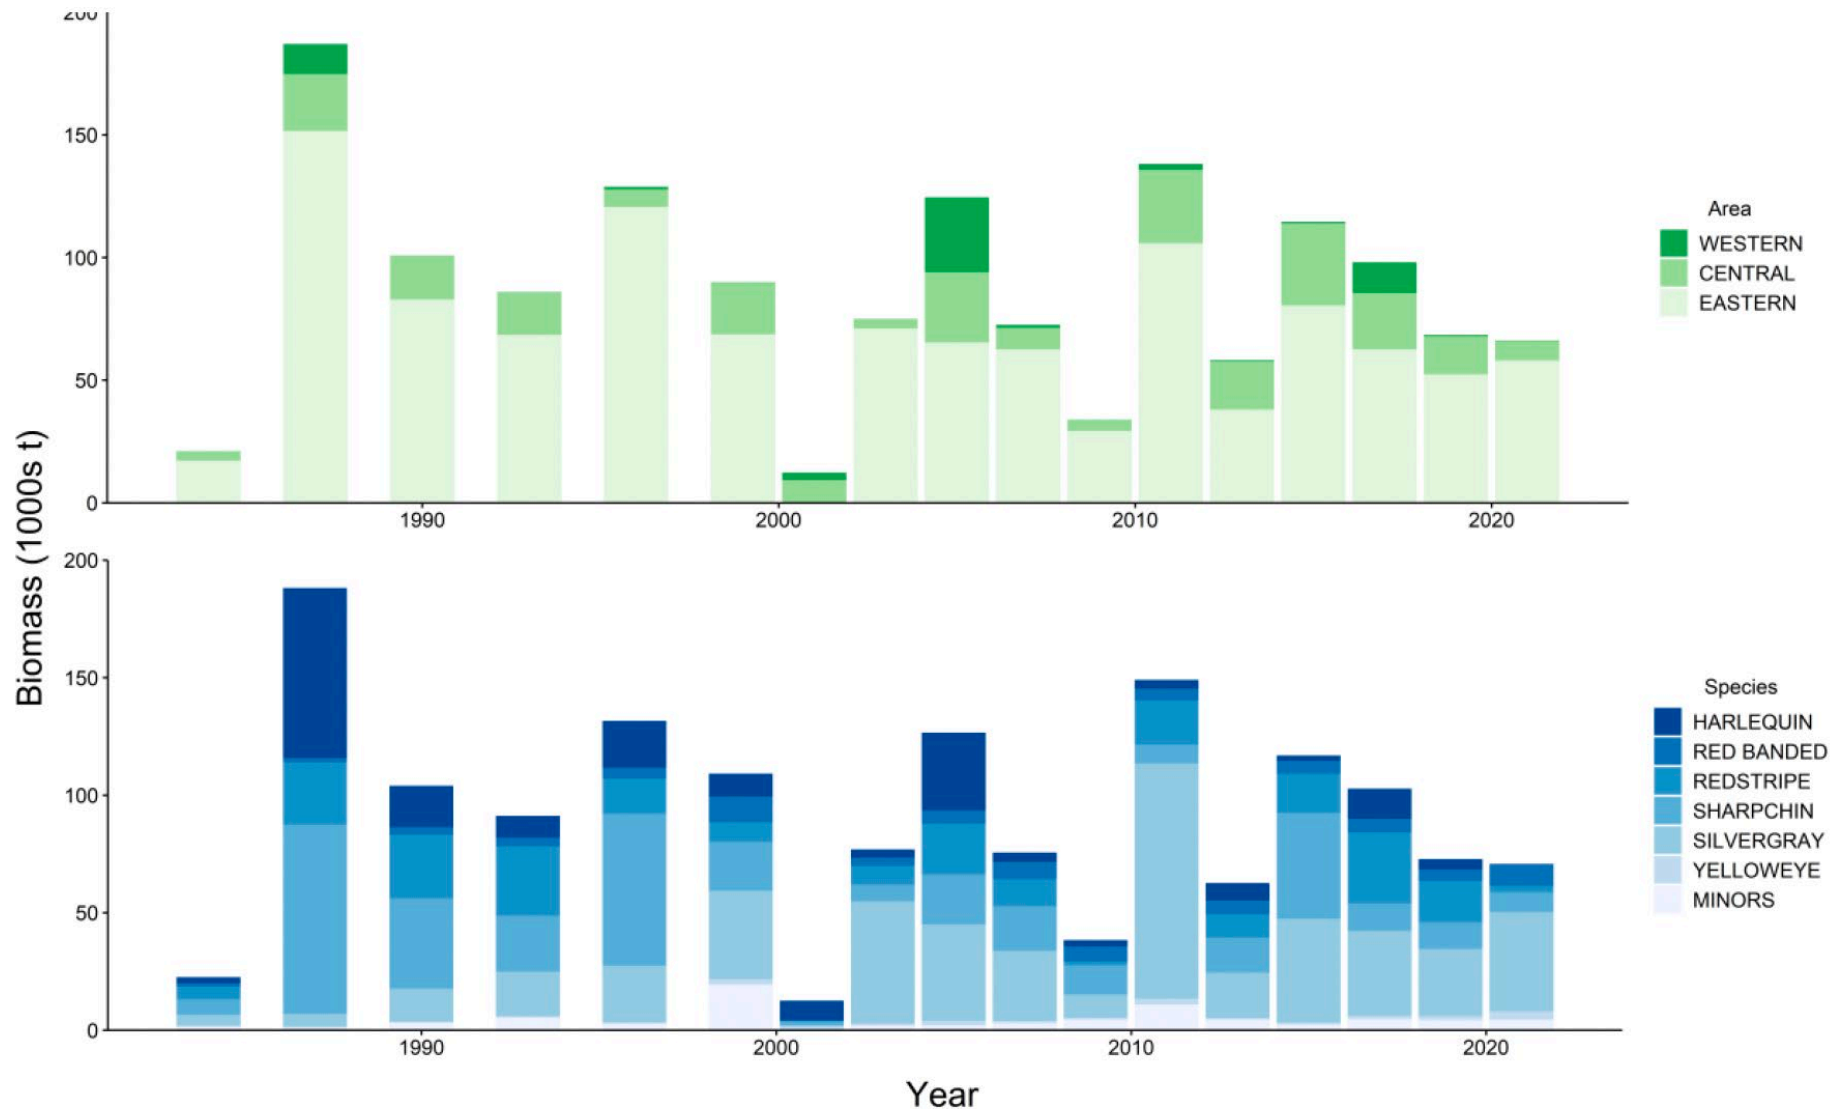

Figure 16.3. Trawl survey biomass estimates for the species in the Other Rockfish complex, by Gulf of Alaska (GOA) regulatory area (top, Western GOA, Central GOA, Eastern GOA) and by species (bottom).

16. Other rockfish

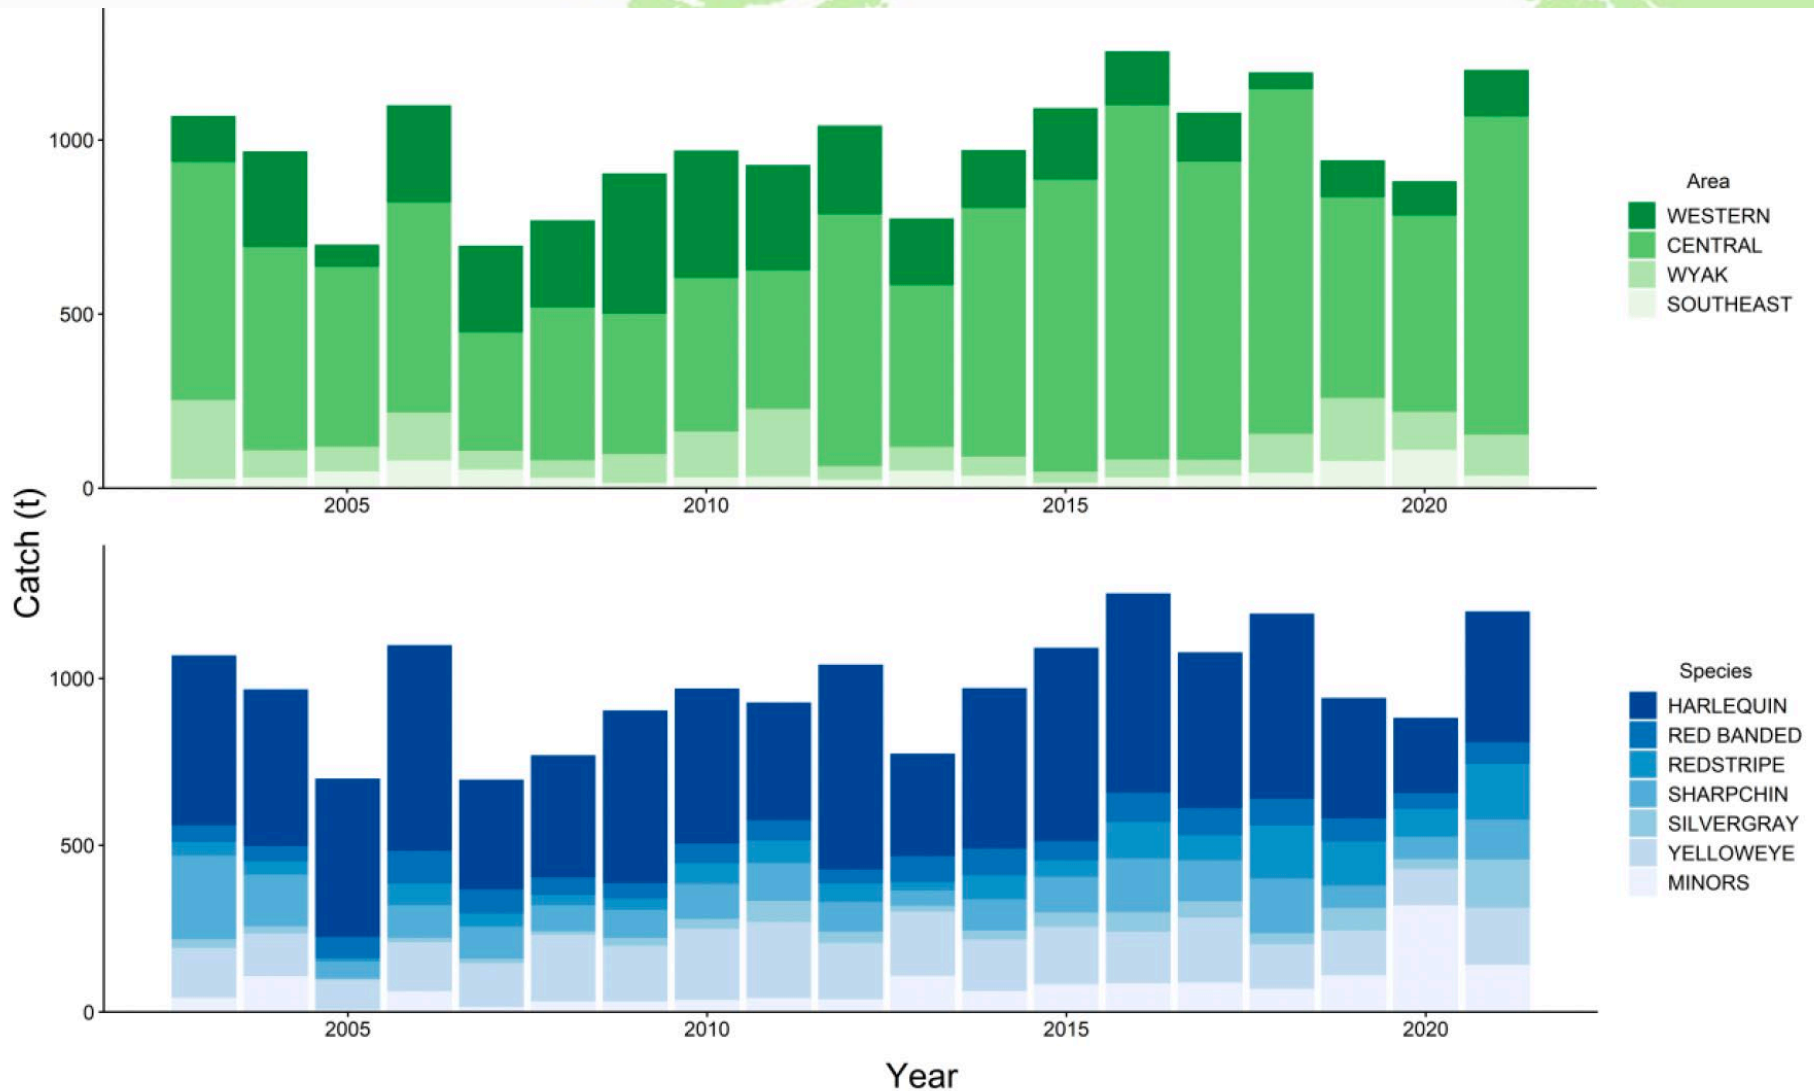

Figure 16.6. Estimated incidental catch (t) of Other Rockfish in Gulf of Alaska (GOA) by area (Western GOA, Central GOA, West Yakutat (West Yak), and East Yakutat/Southeast (Southeast)) and species. National Marine Fisheries Service Alaska Regional Office Catch Accounting System (queried through AKFIN on October 1, 2021).

16. Other rockfish

Figure 16.12. Historical Other Rockfish (OR) apportioned ABC (black lines) compared to the historical OR catch (green bars). The ABC for the OR begins in 2012 when this version of the complex was formed. The 2022 recommended apportioned ABCs are shown as black stars and the proportion change

16. Other rockfish

Plan Team summary

- Appreciated the efforts to align M with the species mix but result was extreme variability due to survey. The survey has proven to be inaccurate in tracking the species biomass and mix of species...so:
 - **The Team recommended rolling over harvest recommendations from 2021 due to the discrepancy between catch and survey biomass and the estimation of weighted M being influenced by a few species that have patchy distributions and survey catchability/availability issues.**
- **The Team recommends the author further explore issues with using the current method of weighted M biomass estimates.**
- **The Team continues to support an earlier recommendation that the DSR subgroup be moved into the DSR assessment and make the DSR assessment GOA-wide pending a Council analysis on spatial management implications.**
- The Team is encouraged that a working group is planning on addressing some of these issues and look forward to the outcomes.
- **The Team recommends incorporating 1 t of the northern rockfish ABC apportionment for EGOA to be combined with OR in the WYAK management area and added for management purposes.**

17. Atka mackerel

Species	2021 catch	ABC 2021	ABC 2022	Change
Pollock	98,769	115,870	144,444	up 28,574 (25%)

Sources: 2021 OFLs, ABCs, and TACs, as well as 2022 OFLs and ABCs, are from harvest specifications adopted by the Council in December 2020. 2021 catches through November 6 2021 from AKR Catch Accounting.

¹ The sablefish ABC total for the GOA is not included in the grand total.

² The Alaska-wide sablefish OFL and ABC are included in the grand total.

Halibut DMRs

Table 5. Proposed 2022 and 2023 Pacific halibut discard mortality rates for vessels fishing in the Gulf of Alaska (percent of Pacific halibut assumed to be dead).

Gear	Sector	Groundfish fishery	Halibut discard mortality rate
Pelagic trawl	Catcher vessel	All	100%
	Catcher/processor	All	100%
Non-pelagic trawl	Catcher vessel	Rockfish Program	66%
	Catcher vessel	All others	69%
	Mothership and catcher/processor	All	83%
Hook-and-line	Catcher/processor	All	15%
	Catcher vessel	All	12%
Pot	Catcher vessel and catcher/processor	All	29%

Actions for the Council

- Approve GOA Groundfish SAFE report
- TACs and apportionments for 2022-2023 (Table 1) including state waters considerations for Pacific cod (Table 2)
- Halibut Prohibited Species Catch (PSC) Limits (Table 14)
 - Halibut PSC in trawl fisheries (Table 15)
 - Halibut PSC in hook and line fisheries (Table 16)

Halibut PSC apportionment

- While developing proposed groundfish harvest levels, the Council will also review the need to control halibut PSC and will recommend appropriate apportionments of PSC limits to fishery categories as *PSC allowances*.
- *Fishery PSC allowances*
intended to optimize total groundfish harvest under established PSC limits, taking into consideration anticipated amounts of incidental catch of prohibited species in each fishery category.

[GOA GF FMP \(3.6.2.1.1\)](#) sets specific procedure for modifying halibut PSC limits during annual harvest specifications process

Halibut PSC apportionment (cntd)

- Types of information the Council will consider relevant to seasonal allocation of PSC limits include:
 - Seasonal distribution of prohibited species;
 - Seasonal distribution of target groundfish species relative to prohibited species distribution;
 - Expected prohibited species bycatch needs on a seasonal basis relevant to change in prohibited species biomass and expected catches of target groundfish species;
 - Expected variations in bycatch rates throughout the fishing year;
 - Expected changes in directed groundfish fishing seasons;
 - Expected start of fishing efforts; and
 - Economic effects of establishing seasonal prohibited species apportionments on segments of the target groundfish industry.

Actions for the Council

- Approve SAFE report
- TACs and apportionments for 2022-2023 (Table 1) including state waters considerations for Pacific cod (Table 2)
- Halibut Prohibited Species Catch (PSC) Limits (Table 14)
 - Halibut PSC in trawl fisheries (Table 15)
 - Halibut PSC in hook and line fisheries (Table 16)
- Halibut Discard Mortality Rates (DMRs) (Table 17)
