

Northern fur seal update

1. Population status (Sterling)
2. Saldrone and fur seal foraging studies (Kuhn)
3. Lenfest Ocean Program, UW, NOAA project update (McHuron)

NPFMC Seattle 27-28 January 2020

Northern fur seal eastern Pacific stock pup production

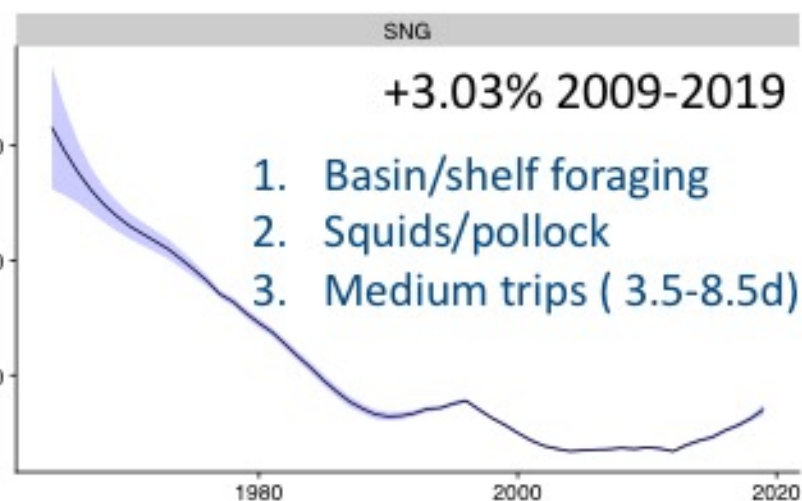

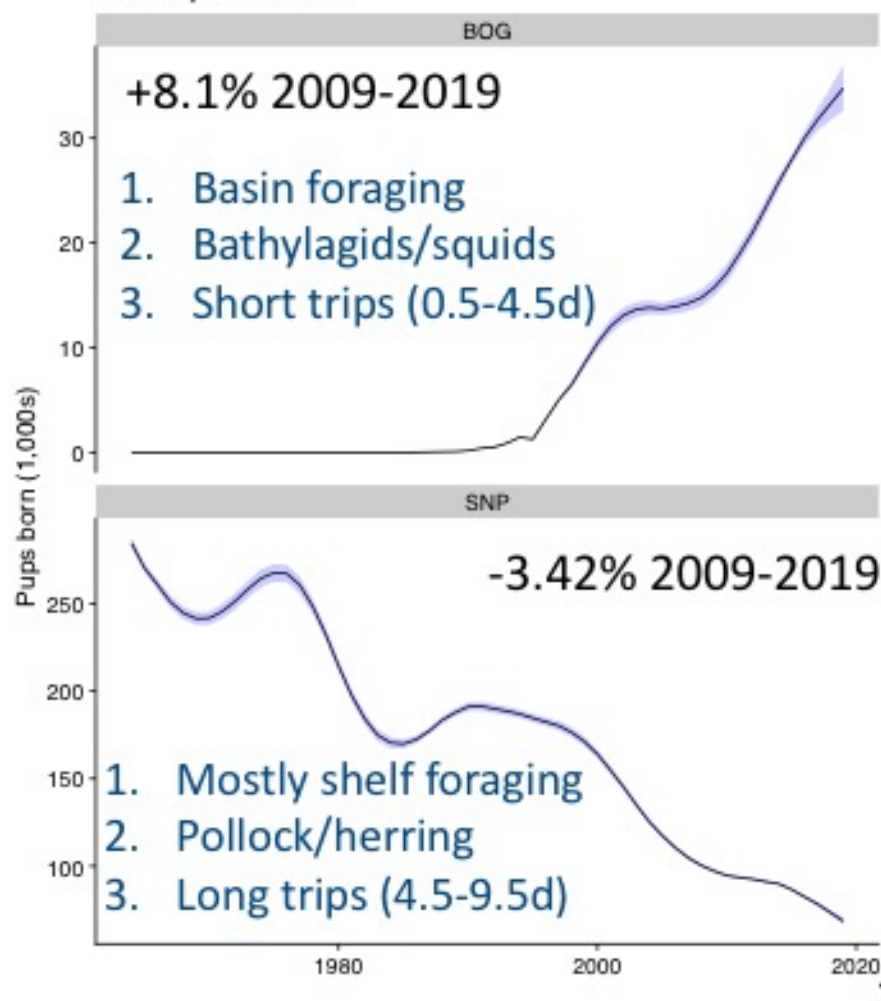

Bering Sea stock production

Northern fur seal island pup production

Island production

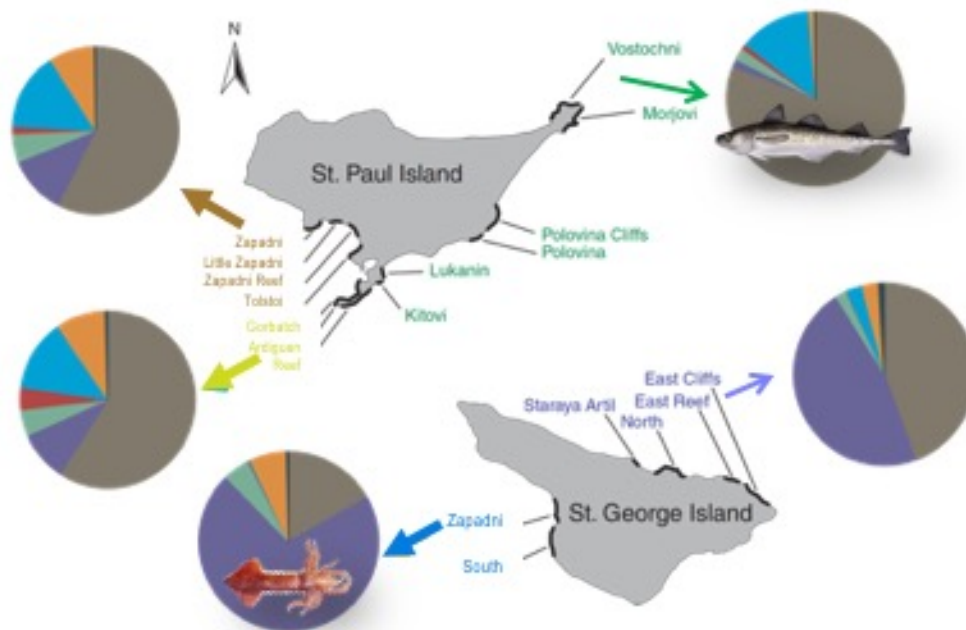

Key differences between islands:

1. Summer feeding habitats and diets differ
2. Mom feeding trip durations differ
3. Winter foraging similar between islands

Northern fur seal complexes defined by diets and foraging location

Diet complexes and diet composition

Adult female foraging complexes

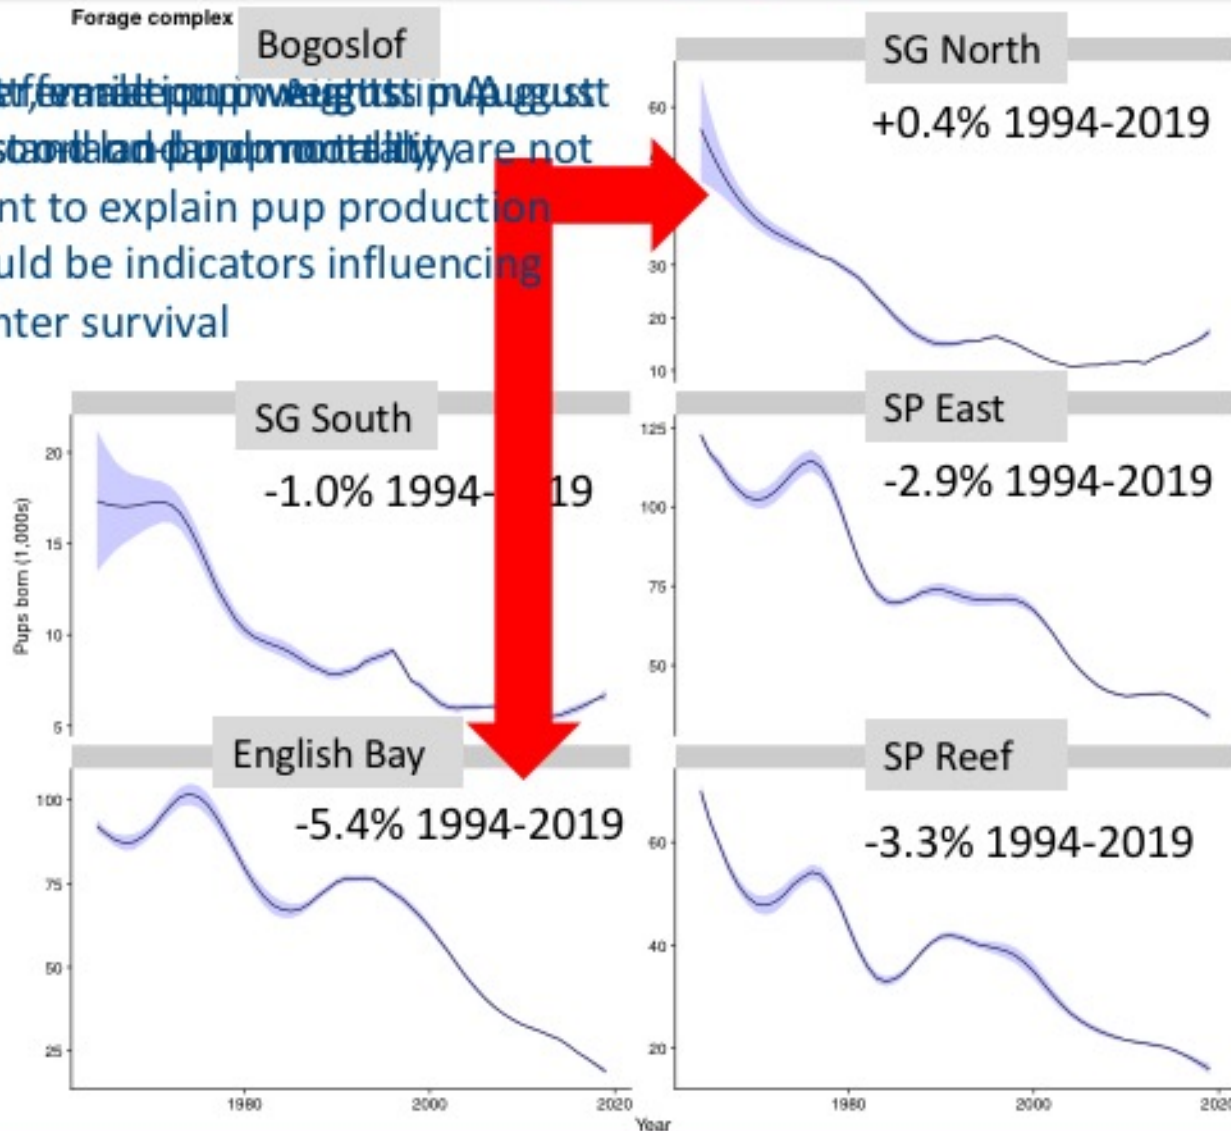

Zeppelin and Ream 2006 & McHuron et al. under AFSC review

Northern fur seal complex pup production

1. Highest for milk production in August
2. Weight gain and pup mortality are not sufficient to explain pup production
2. But, could be indicators influencing overwinter survival

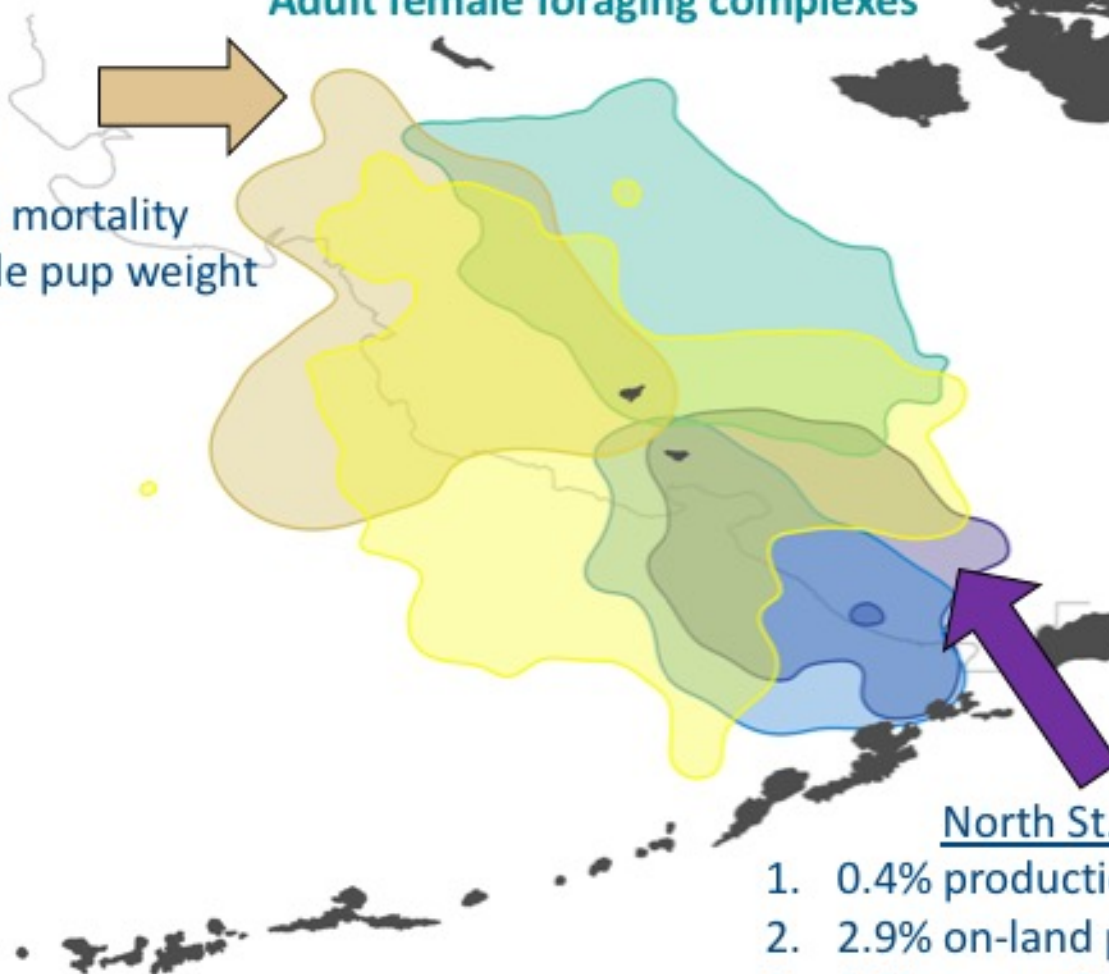

Contrasting complex indicators (1994-2019)

Adult female foraging complexes

English Bay, St. Paul

1. -5.4% production
2. 4.5% on-land pup mortality
3. 7.9kg mean female pup weight

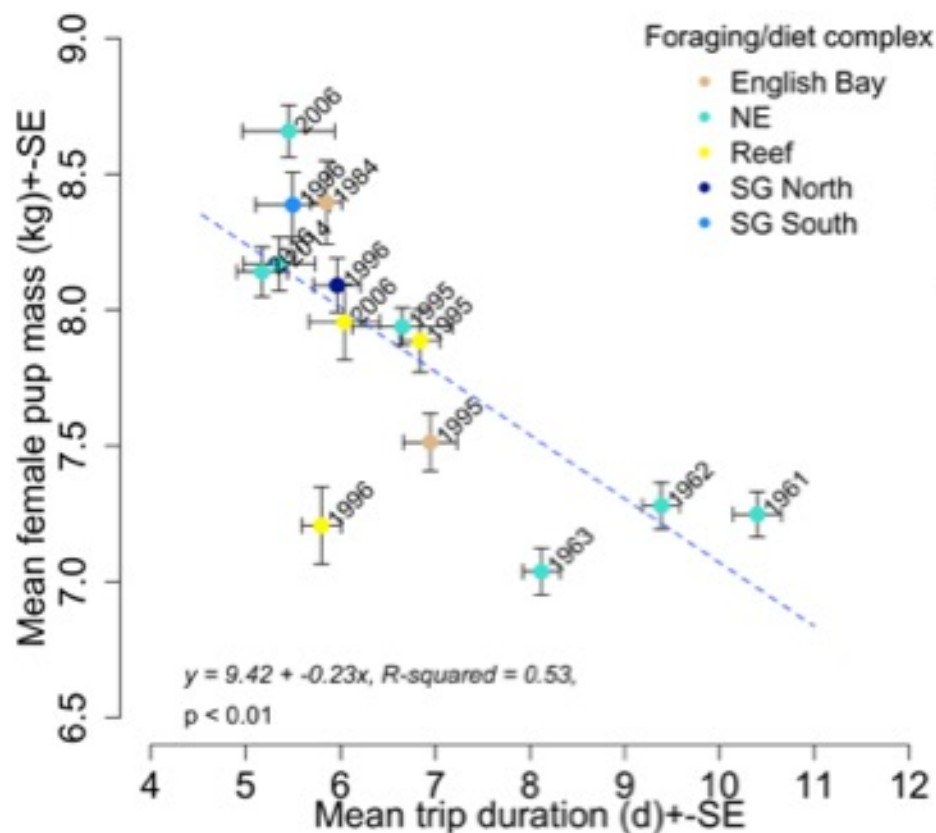

North St. George

1. 0.4% production
2. 2.9% on-land pup mortality
3. 8.5kg mean female pup weight

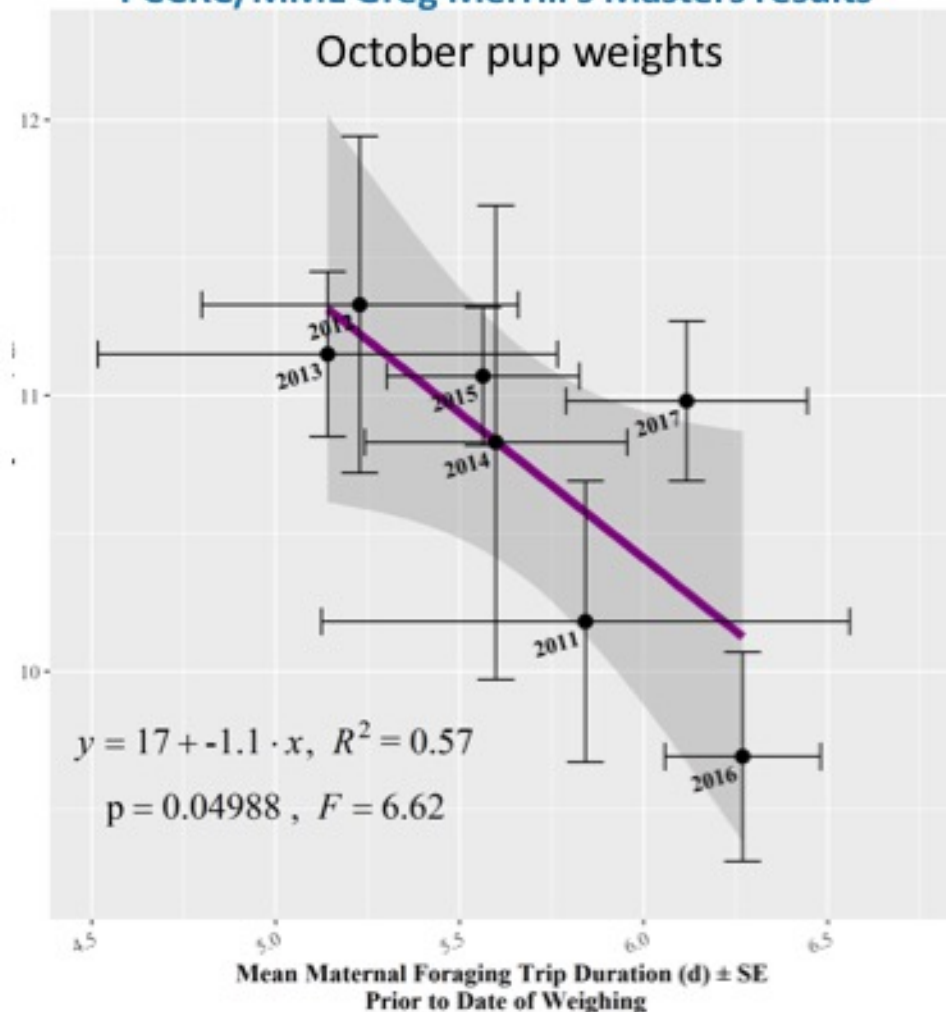

Cross sectional observations of adult female trip duration and pup weights

MML long term monitoring observations
August 24 female pup weights

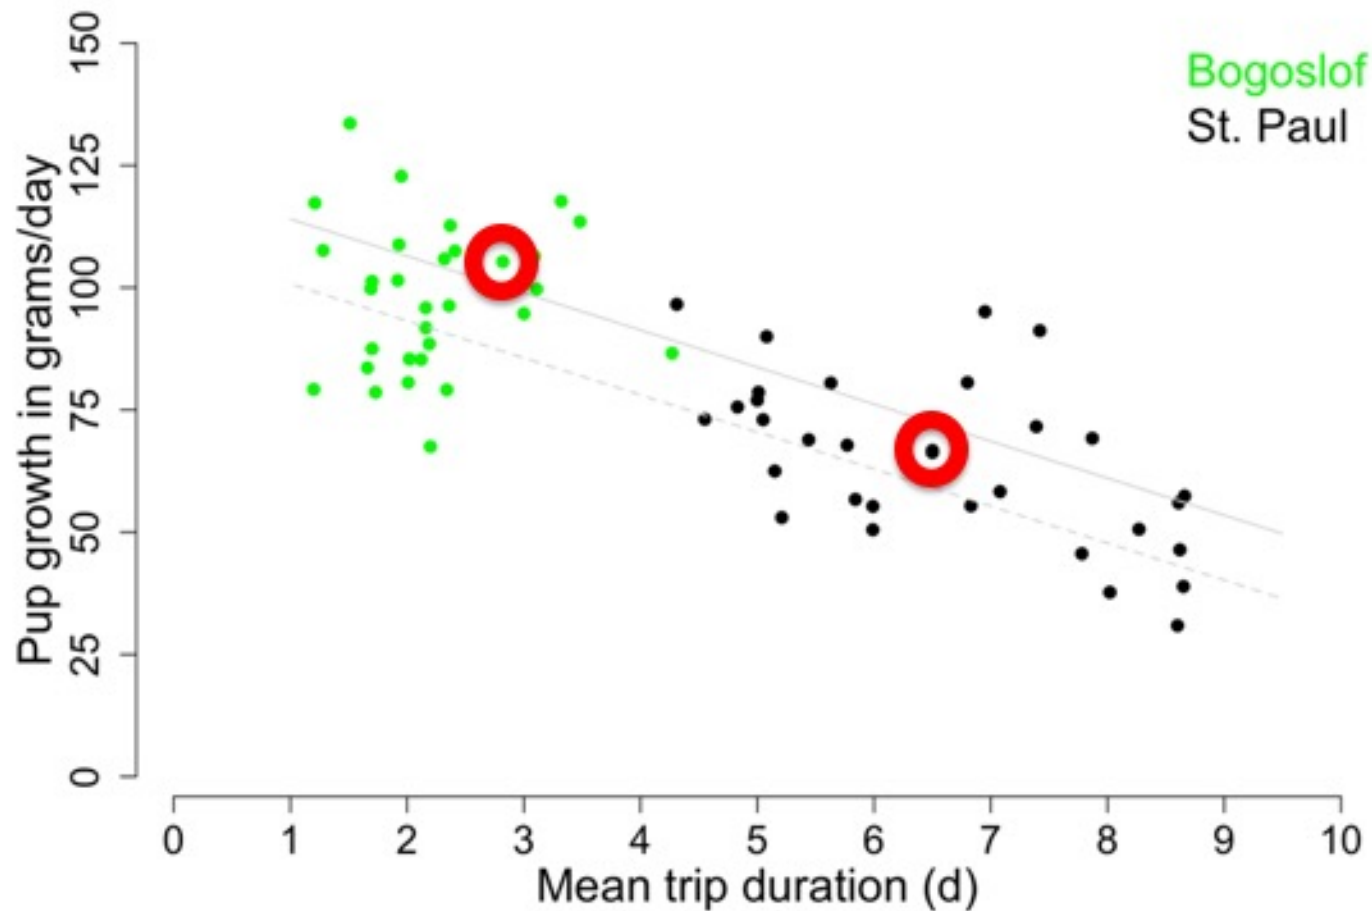

PCCRC/MML Greg Merrill's Masters results

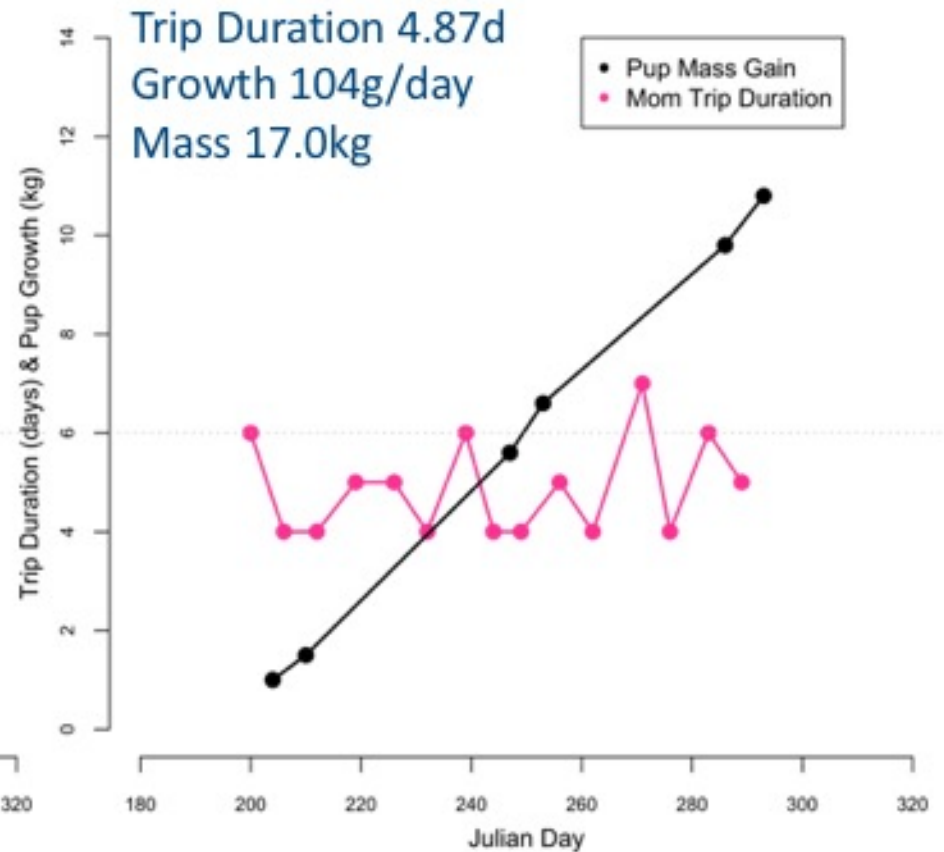

Longitudinal observations of trip duration and pup growth

COFFS NPRB Study in 2005/06

Fine scale observations of female trip durations and pup growth

Unmanned surface vehicles map prey landscapes to elucidate northern fur seal behavioral responses to prey availability

Northern fur seal Conservation Plan

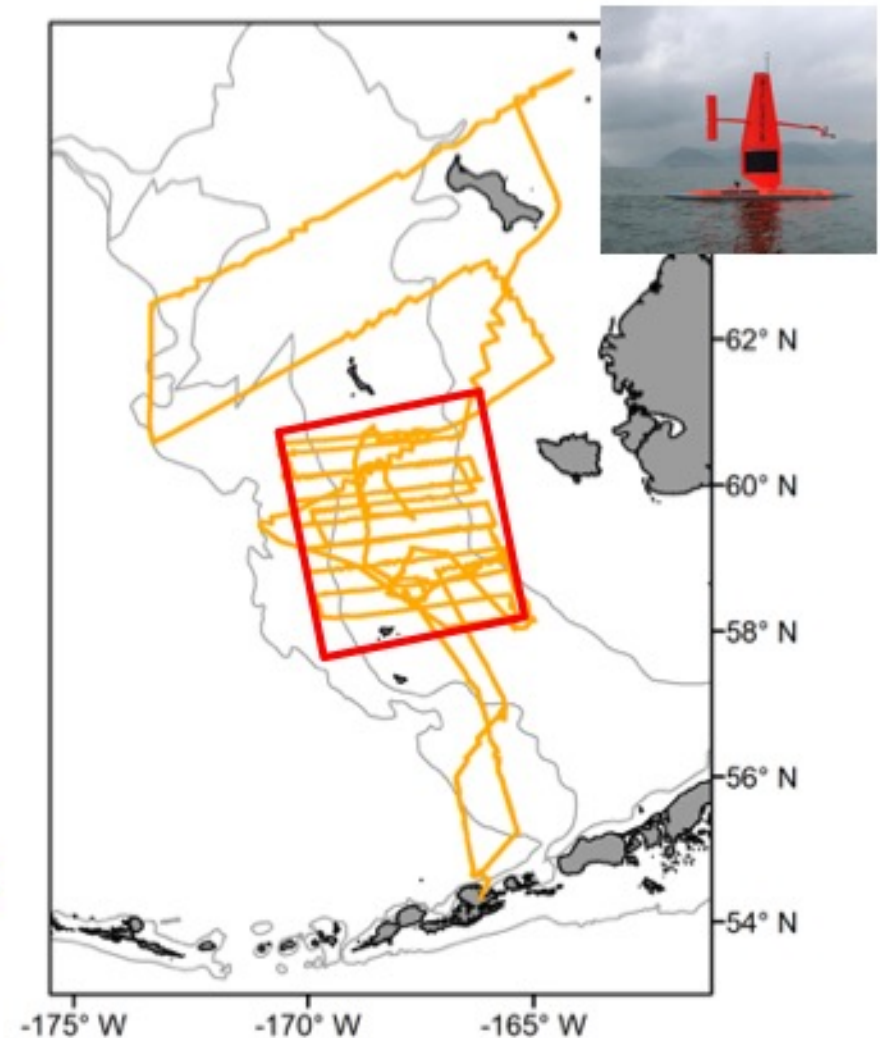

Improve knowledge of the numerical and functional relationships between fur seals, fisheries, and fish resources

2019 Research

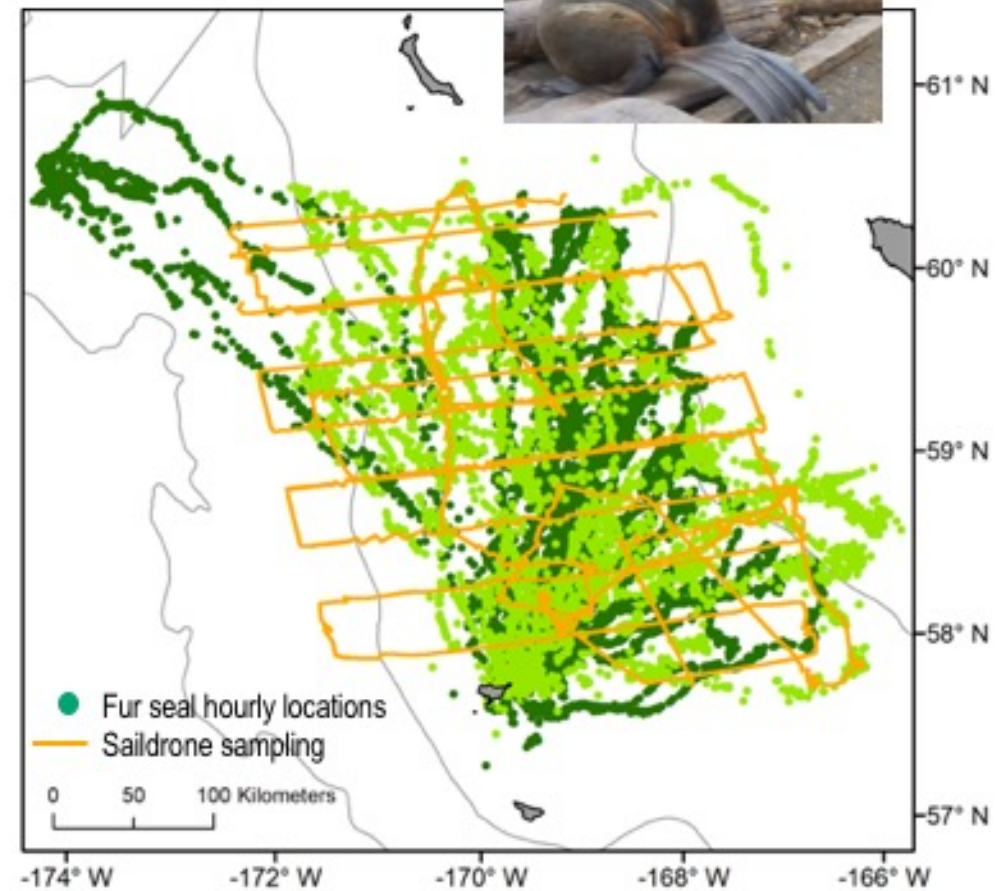

- Continuation of Sairdrone project
 - 2016- 2 Sairdrones (May-Sept)
 - 2017- 1 Sairdrone (July-Sept)
- 1 Sairdrone
- 16 May to 10 Oct, 6,900+ km
- 95 days in core fur seal area
- 1 full survey, 6 focal follows, & 1 partial survey

2019 Research

- 10 adult females tracked (13 Aug-23 Sept)
- 4 instrumented with accelerometers, 3 with video cameras
- Video recorded on 900+ dives (2.5 to 5 d)
- Foraging trips 8.0 ± 0.2 d

Focal follow study

- Tested feasibility of using Saldrone to conduct

ABSTRACT: We tested the feasibility of using Saldrone unmanned wind- and solar-powered surface vehicles to conduct remote focal follow studies of northern fur seals *Callorhinus ursinus*. Using Argos satellite and transmitted GPS locations, the Saldrones followed a fur seal while recording oceanographic conditions and mapping prey abundance and depth distribution using a scientific echosounder. The Saldrones successfully followed 6 fur seals over 2.4 ± 0.2 d and 149.7 ± 16.3 km of the foraging path. Median separation distance between the Saldrone and fur seal path was 0.65 ± 0.1 km and average time separation was 9.9 ± 1.4 h, with minimum time separations ranging from 1.9 to 4.9 h. Time and distance separation were a function of both animal behavior and study design. Our results show that Saldrones can approach satellite tracked marine predators from long distances and follow them over extended periods while collecting oceanographic and prey data. These successful focal follows demonstrate that unmanned surface vehicles are a valuable tool for collecting data on fine-scale relationships between marine predators, their prey, and the environment.

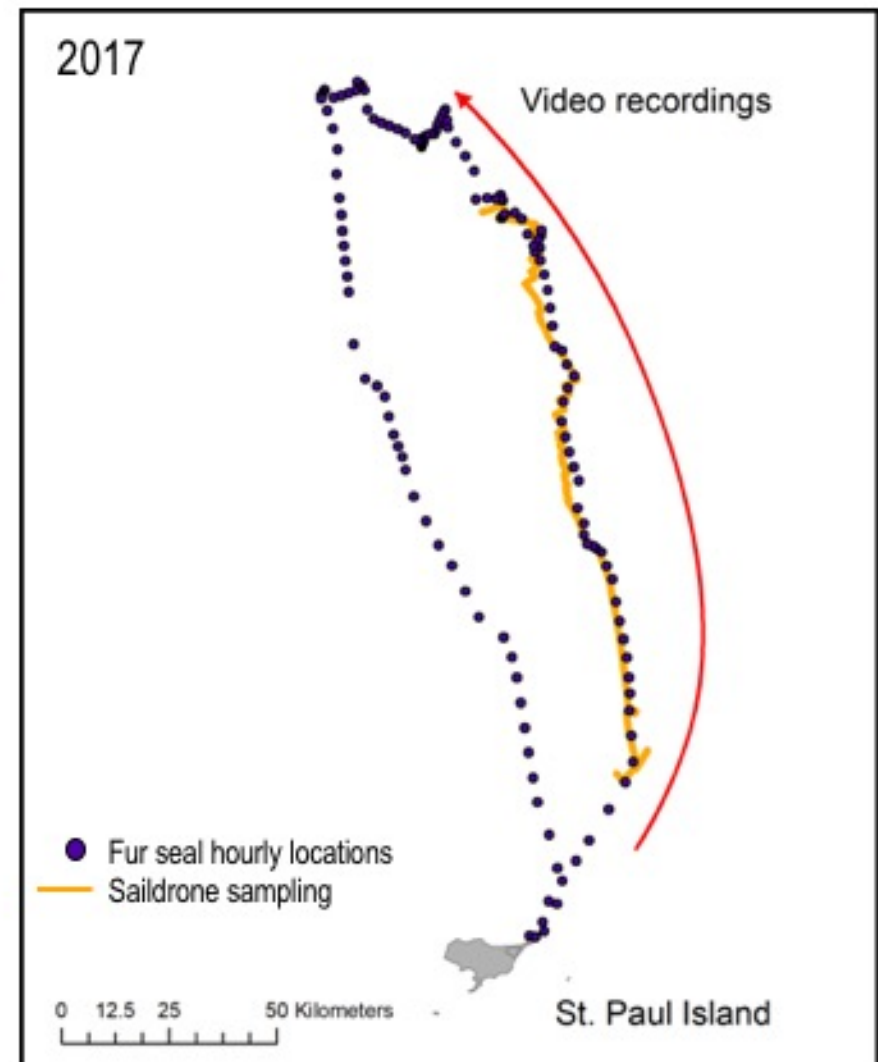

- 6 focal follows in 2019

Preliminary video results

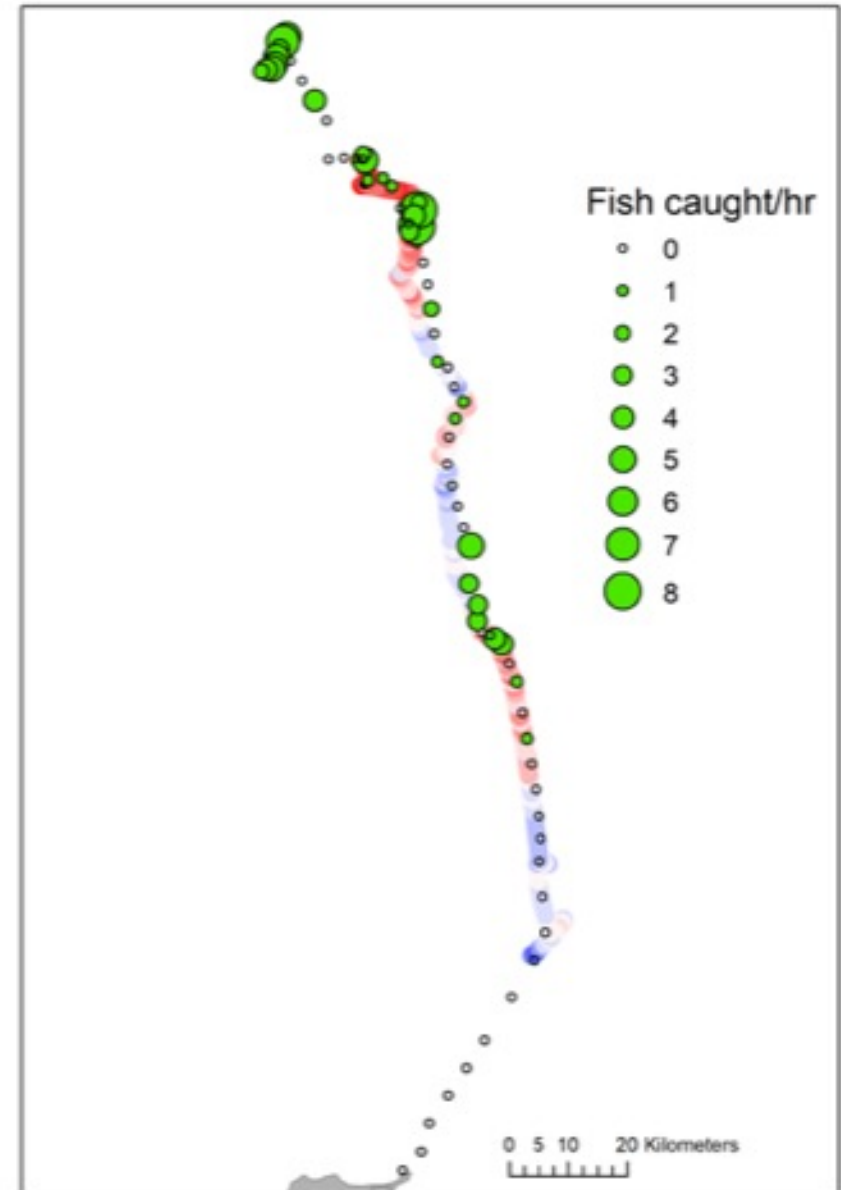

- Prey capture results from single fur seal (video 2.5+ d)
- 259 dives with recorded video
 - 73% of dives in recording period
 - 44.5% of all dives in the foraging trip

Preliminary video results

- Prey capture results from single fur seal (video 2.5+ d)
- 259 dives with recorded video
 - 73% of dives in recording period
 - 44.5% of all dives in the foraging trip
- 107 fish captured in 93 dives (0-3 fish/dive)
- 35.9% of recorded dives with prey capture

Preliminary video results

- 99% of fish captured classified as large

Large pollock capture

03Sep17 06:45:37.092

Small fish capture

14Aug19 03:23:54.134

Bogoslof Island foraging study

- Tracked 6 females (Aug-Dec)
- Preliminary analysis

December 2019

EBS Ecosystem status

Contrasting Trends in Northern Fur Seal Foraging Effort Between St. Paul and Bogoslof Islands: 2019 Preliminary Results

- The Eastern Stock of northern fur seals (*Callorhinus ursinus*), which is comprised of three breeding islands (St. Paul [SP], St. George [SG], and Bogoslof [BG] islands), is listed as depleted under the Marine Mammal Protection Act. Since 1998, pup production on the Pribilof Islands (SP and SG) has declined by 51% or at an annual rate of 3.4% (Towell et al., 2019). In contrast, pup production on BG has increased at an annual rate of 10% since 1997 (Towell et al., 2019). While the ultimate cause(s)

trips from St. Paul Island
(~ 8 d in 2019)

Ongoing steps...

- Preliminary 2019 echosounder data expected in Feb
- Complete analysis of 900+ videos collected in 2019, including investigating AI/Machine learning options
- Continued analysis and integration of datasets- fur seal behavior (dive, tracking, video, acceleration), fish abundance and depth distribution, and oceanographic data
- Exploring ways to integrate these data into the ongoing Lenfest project

Using bioenergetics and spatial data to quantify how northern fur seals interact with prey, fisheries, and climate

Contribution of energetics manuscript

Conservation Physiology <https://doi.org/10.1093/conphys/coz103>

- Retrospective analysis of metabolic rates collected on lactating females in 1995 and 1996
- Primary findings
 - At-sea metabolic rates increased from summer to fall by $\sim 7.2\%$
 - At-sea metabolic rates not related to mass gain, dietary variation, or diving behavior
- Conclusions
 - May have reached a metabolic ceiling by early in the population decline
 - Limited physiological flexibility to respond to environmental change
 - High metabolic overhead of lactating females likely reduces energy available for lactation
- Key inputs into bioenergetic model

NOAA FISHERIES

Bioenergetic model data streams

Physiology and morphology

- Metabolic rates
 - Milk intake
 - Mass and mass changes
 - Molt timing
 - Metabolic efficiency
- Energy intake

Behavior

- Trip and shore durations
 - Arrival and departure times
- Energy intake

Demographics

- Pup counts
 - Survival and reproductive rates
- Distribution
Population size

Diet

General Approach

- Five groups based on size and energetic demands
 1. Lactating females
 2. Non-lactating females
 3. Adult males
 4. Subadult males
 5. Juveniles
- Individual-based simulations designed to capture natural behavior of fur seals

- Summed by year and rookery complex and combined with diet estimates from a biomass reconstruction model

Incorporating uncertainty

- Population size drawn from 11 different models
 1. Life history tables
 2. Pup and adult survival rates
 3. Overall approach
- Parameter values largely drawn from distributions to account for individual, temporal, and spatial variation within the population
 1. Arrival and departure times
 2. Trip and shore durations
 3. Lactation duration and pup growth rates
 4. Mass and mass changes
 5. Etc
- Bootstrap resampling to estimate variation around point estimates of diet

Who's contributing the most?

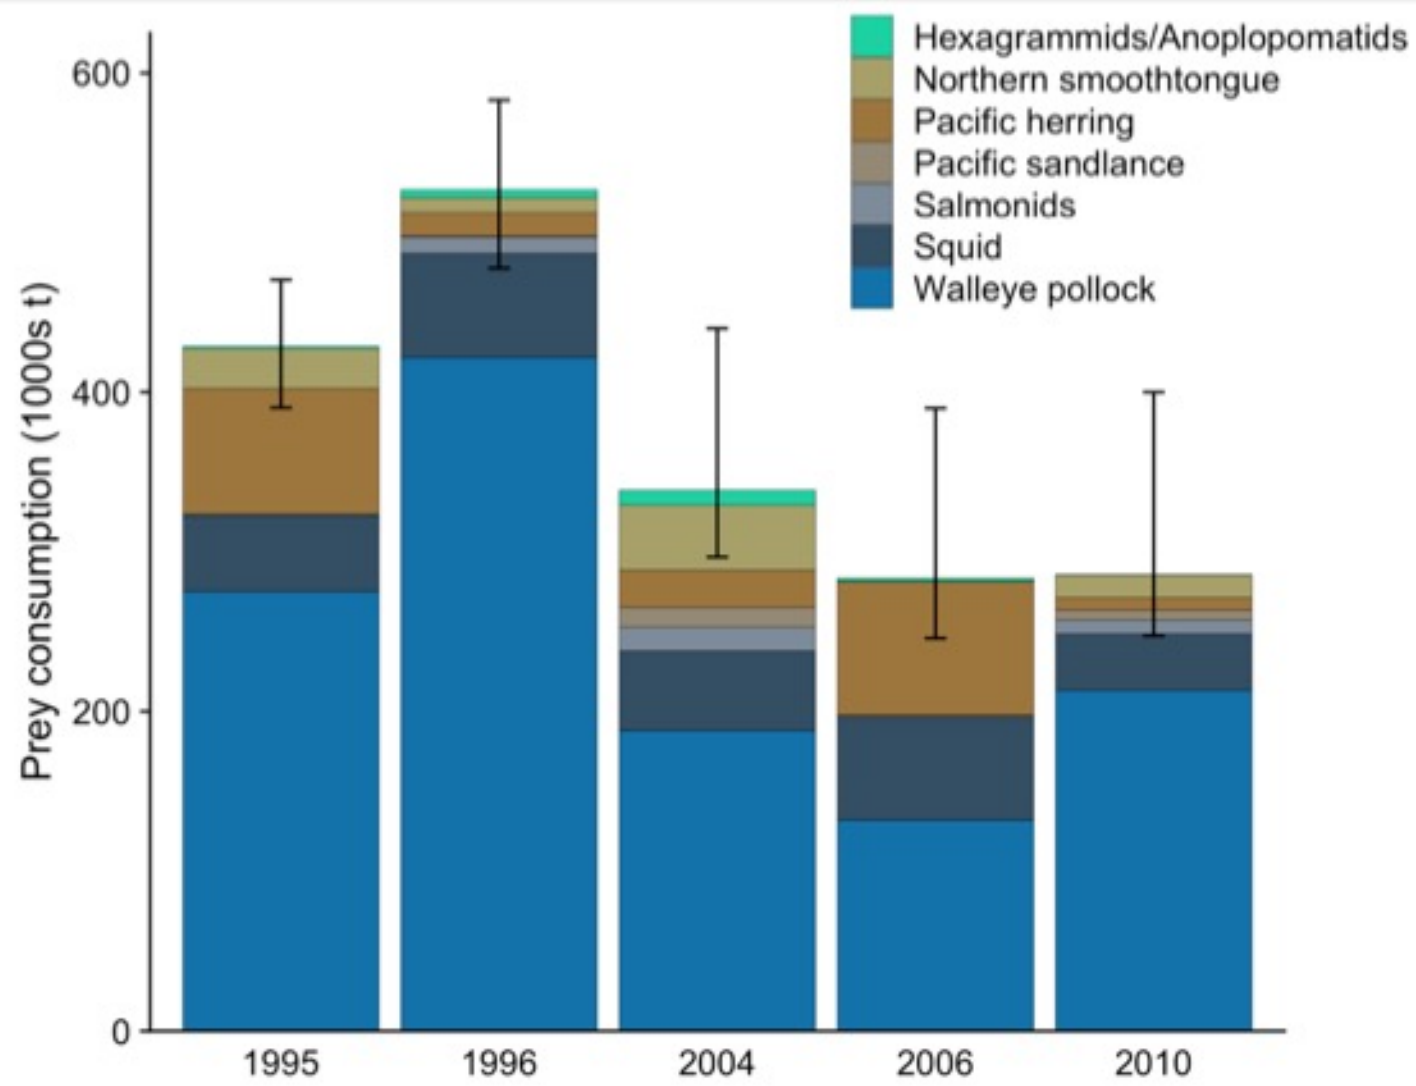

- 9.8%
- Body size
- Tenure

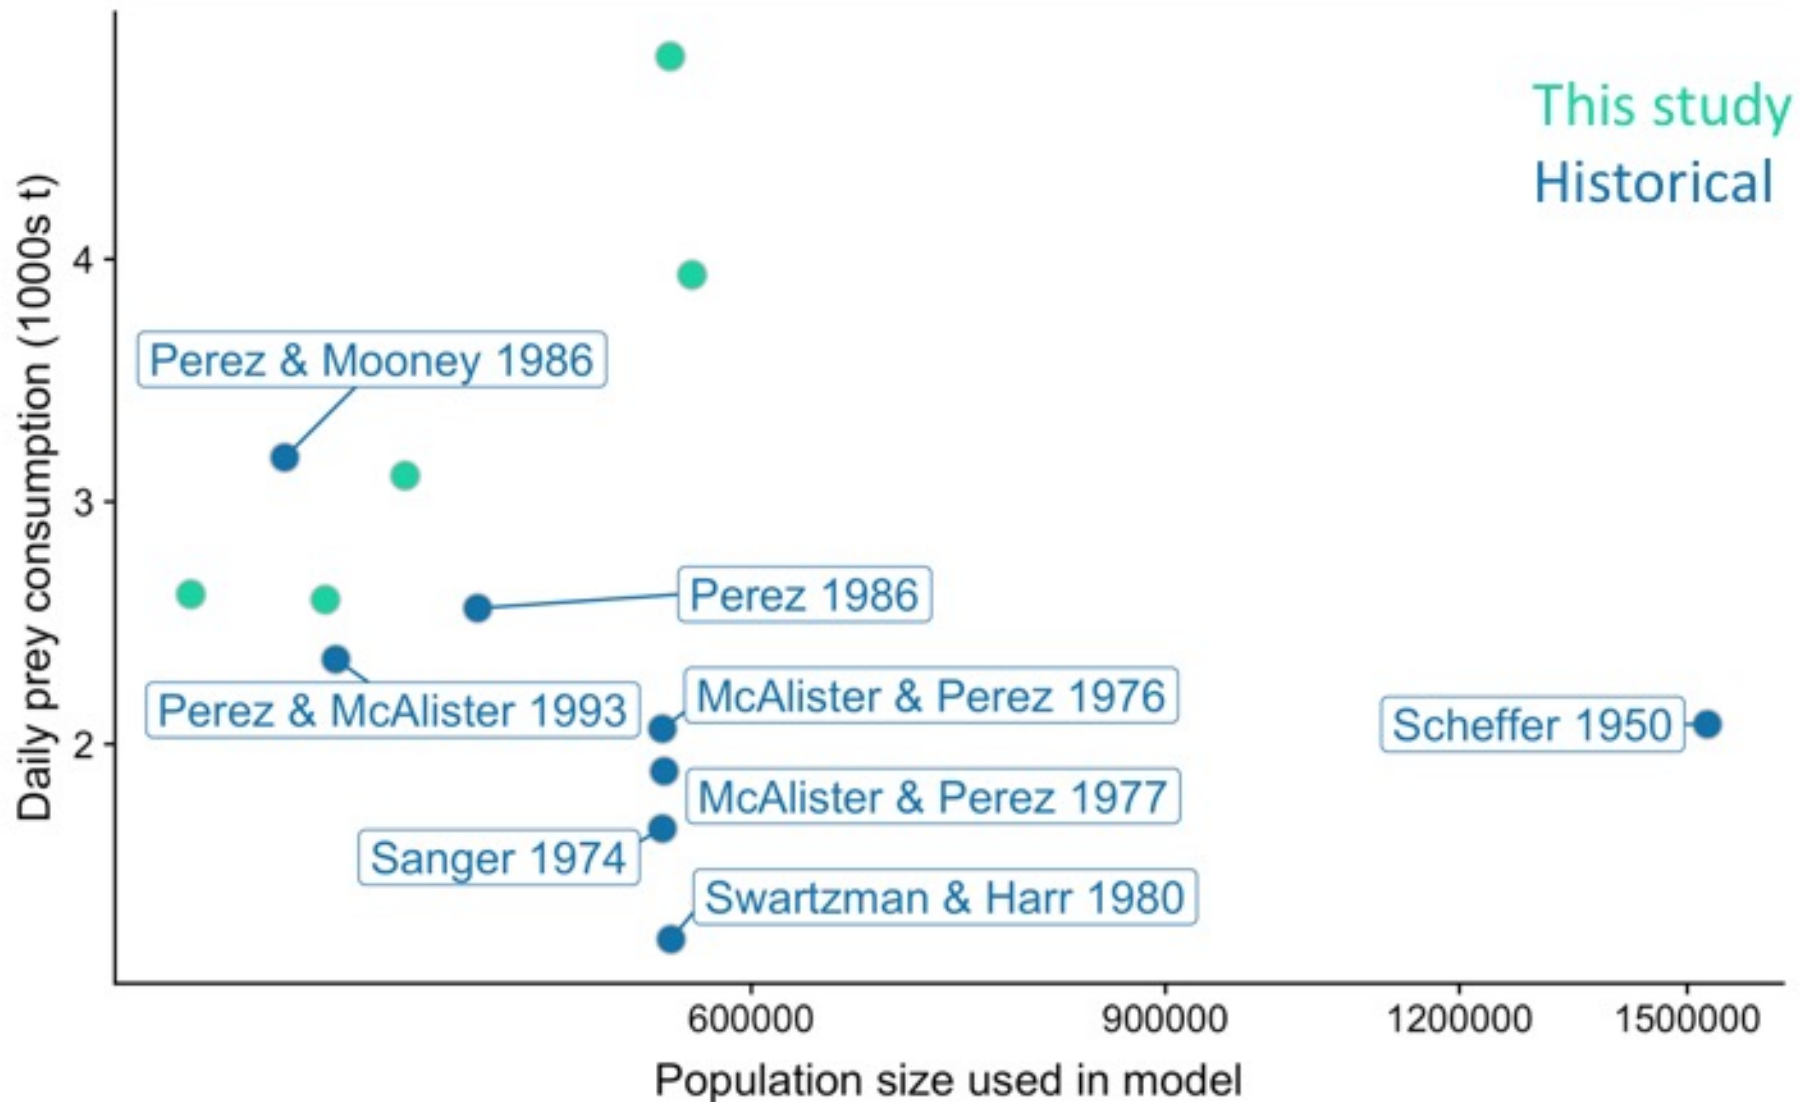

- 33.8%
- Cost of lactation

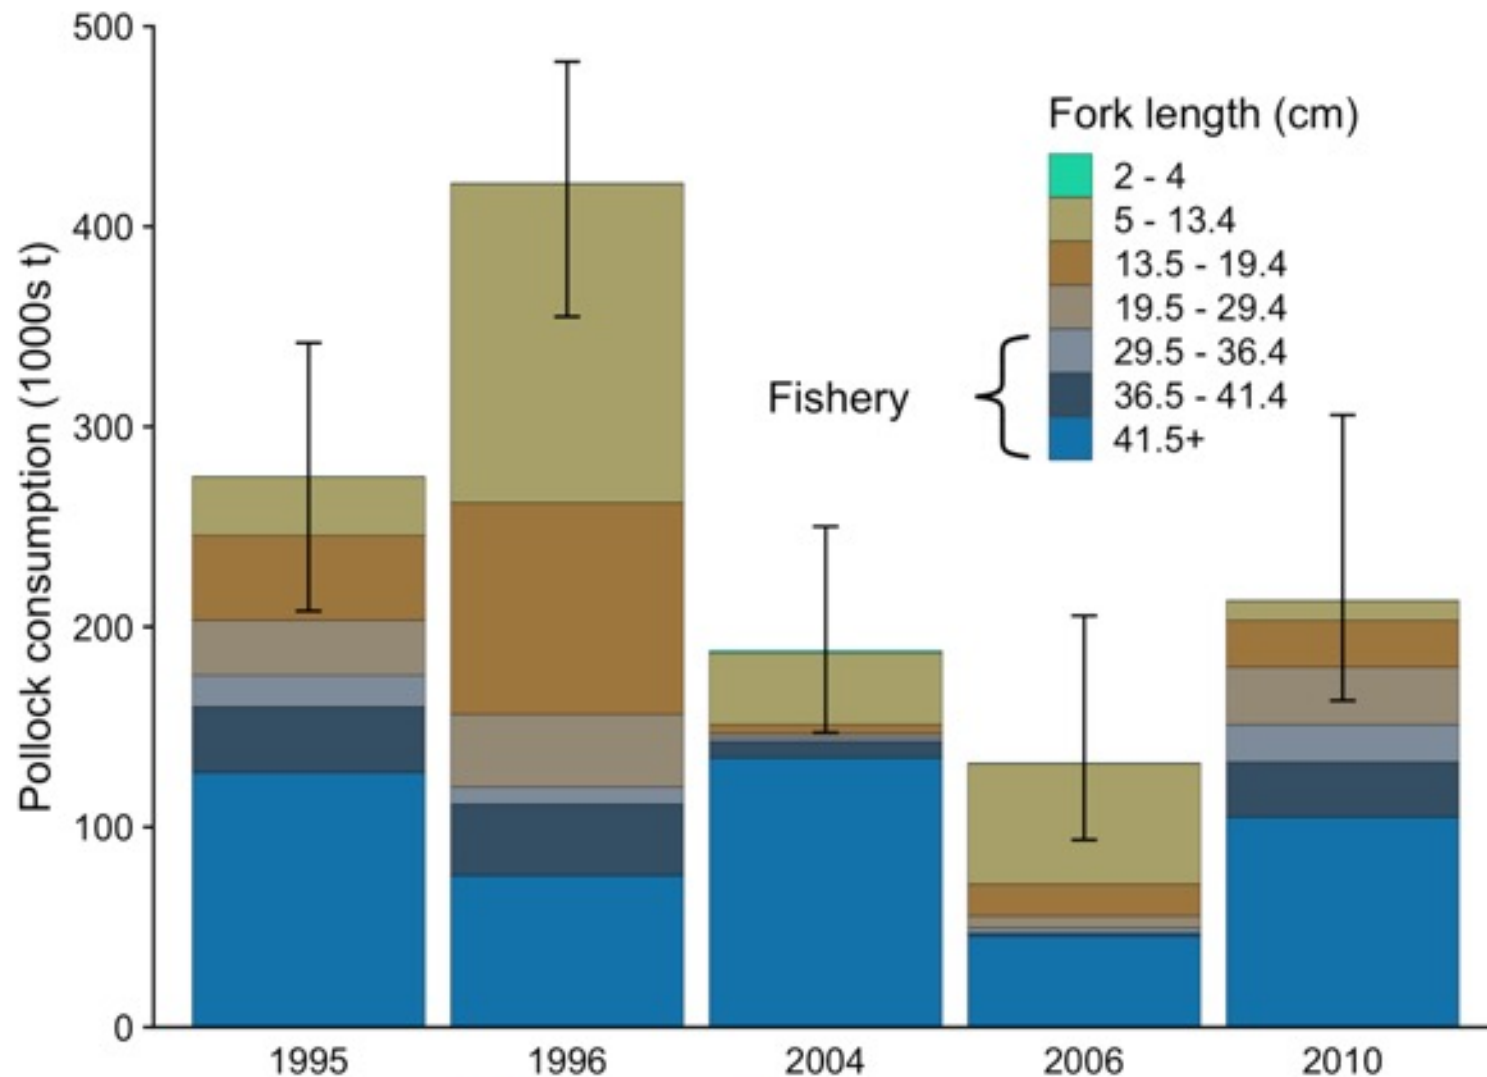

How much prey did fur seals consume?

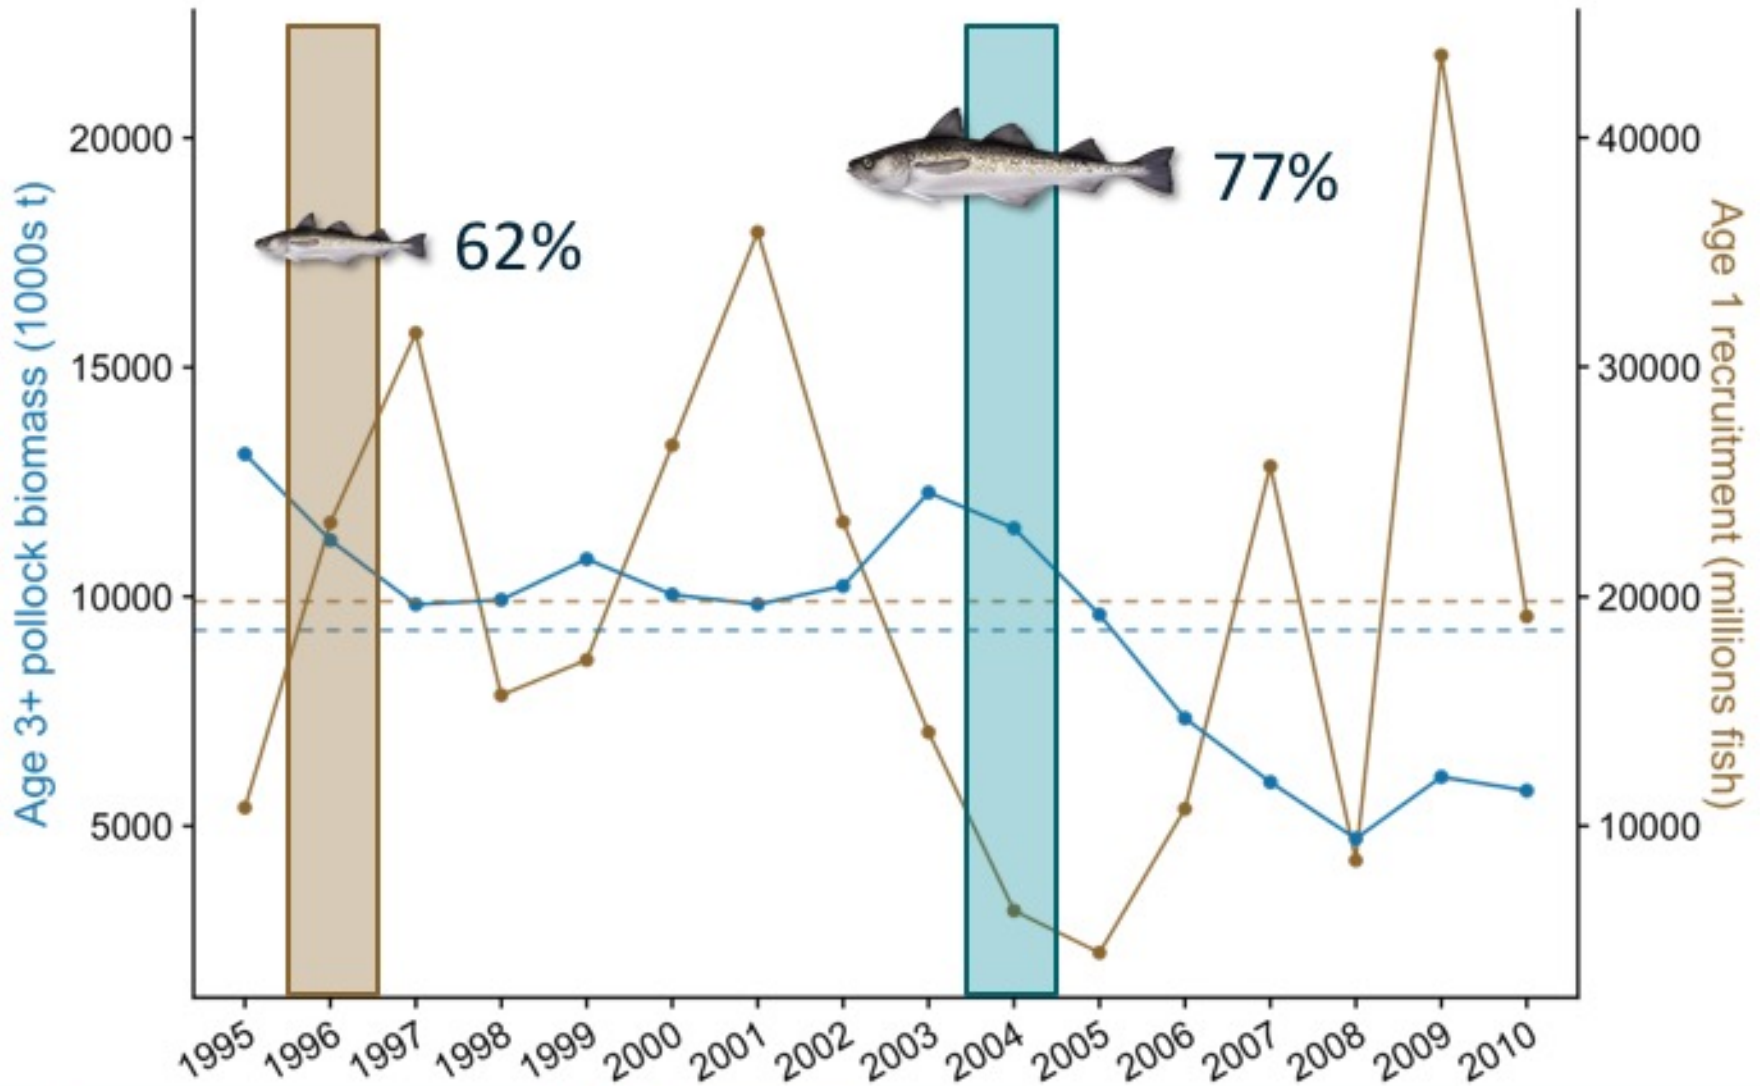

How do our consumption estimates compare with past efforts?

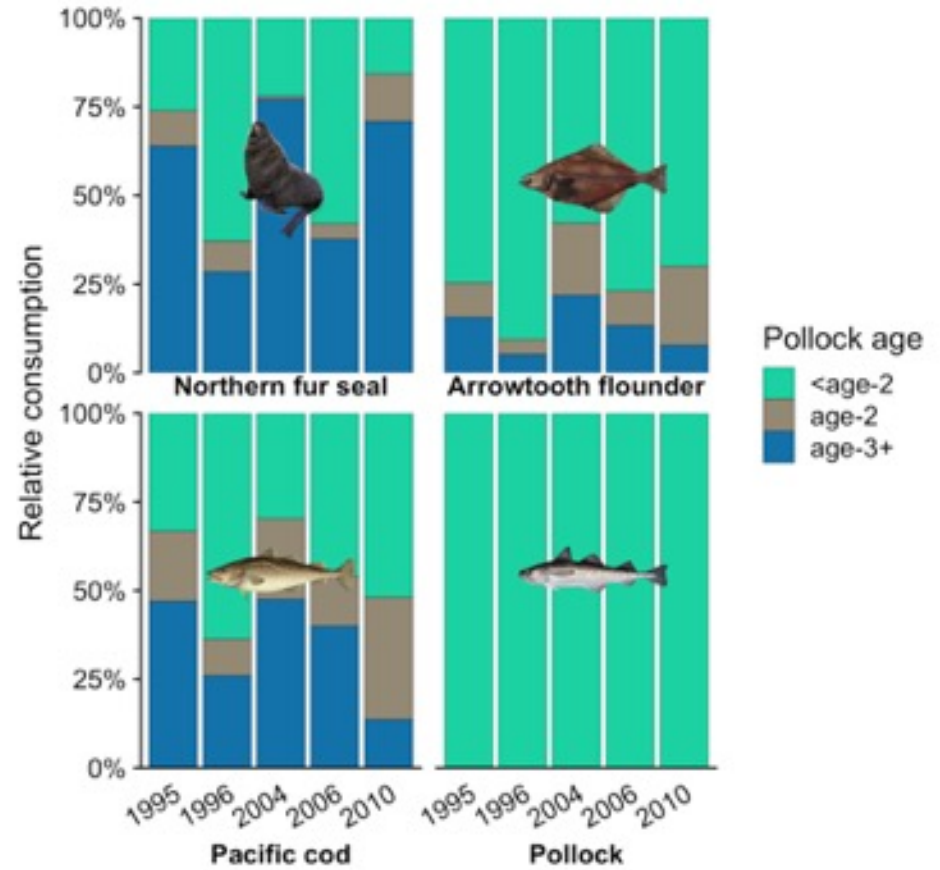

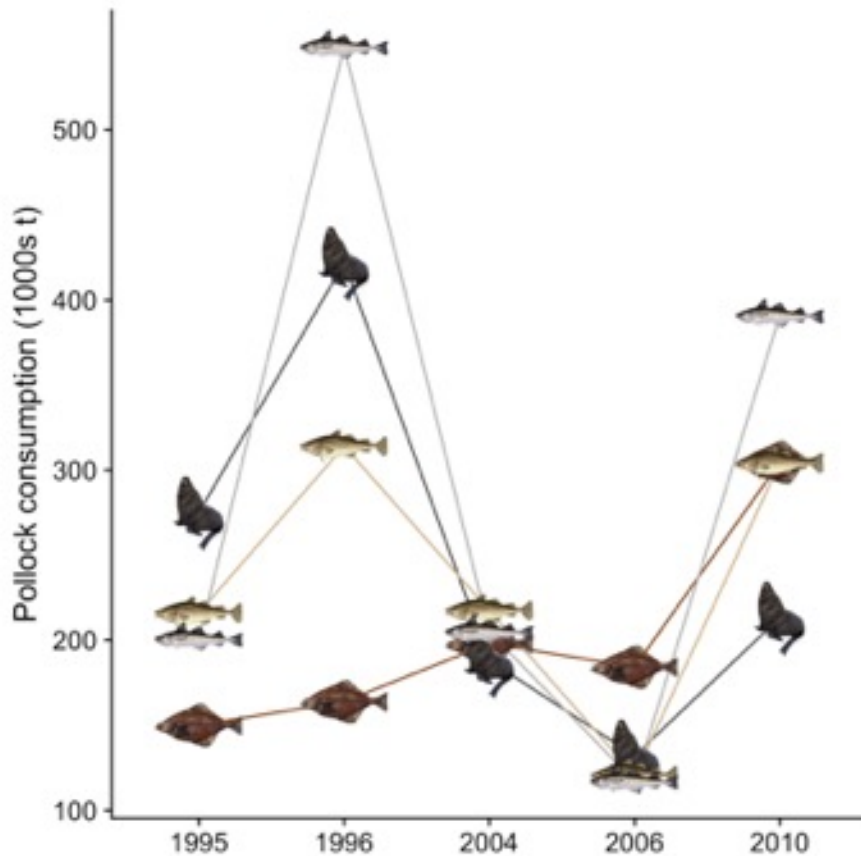

What is the size-specific consumption of pollock?

Does consumption reflect availability?

How do fur seals compare to other pollock predators?

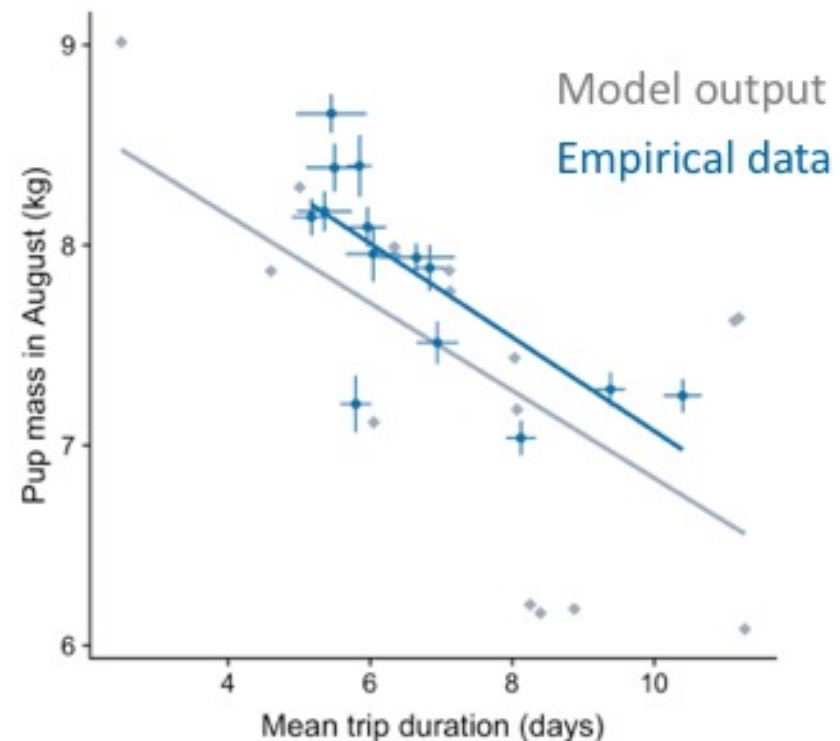

Lenfest ongoing steps....

Dr. Liz McHuron – Fur seal behavioral model

1. Develop a behavioral model to predict the foraging behavior of lactating female fur seals
2. Working version that involves a simplified environment
3. Next step is to use FEAST to characterize environment

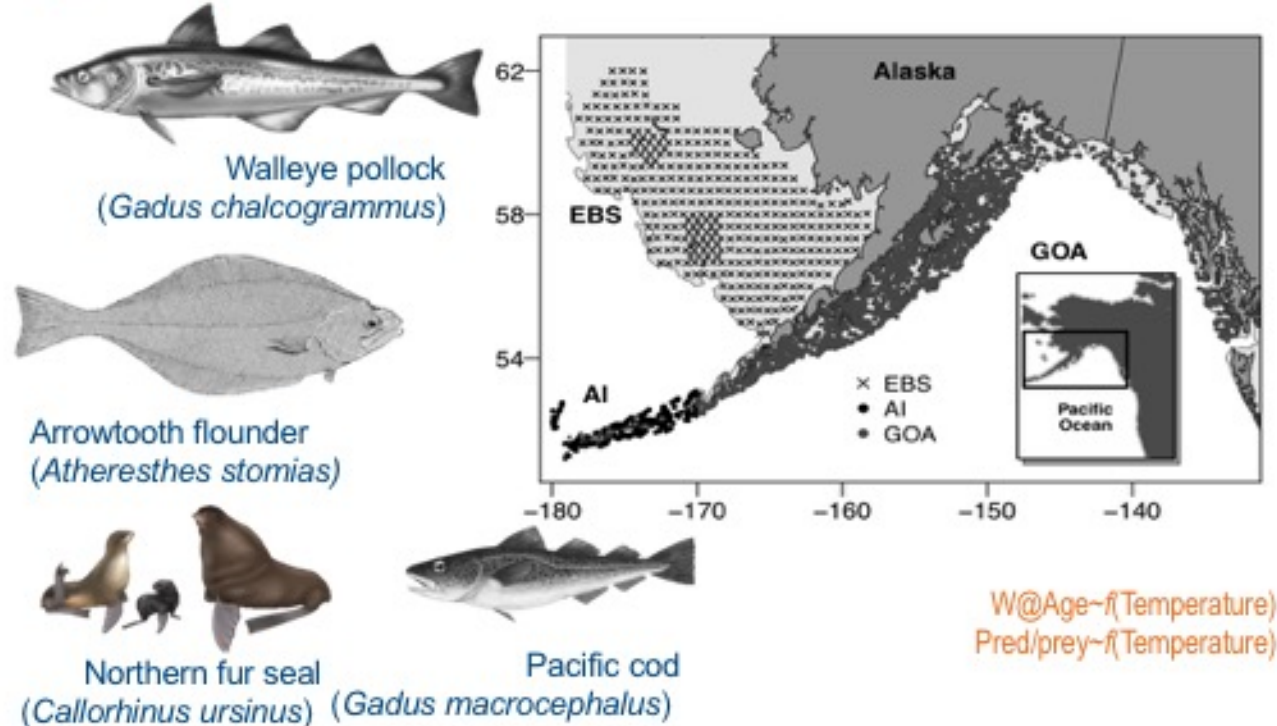

Lenfest ongoing steps....

Dr. Kirstin Holsman – CEATTLE multi-species

1. 5 high resolution years used to couple NFS bioenergetic model to CEATTLE (analyses underway)
2. New diet analyses will add 8 more years of fur seal consumption estimates (February 2020)

Climate-Enhanced, Age-based model with Temperature-specific Trophic Linkages and Energetics
