

Bristol Bay red king crab

Final SAFE

September 2022

K.J. Palof and M.S.M. Siddeek

ADF&G

katie.palof@alaska.gov

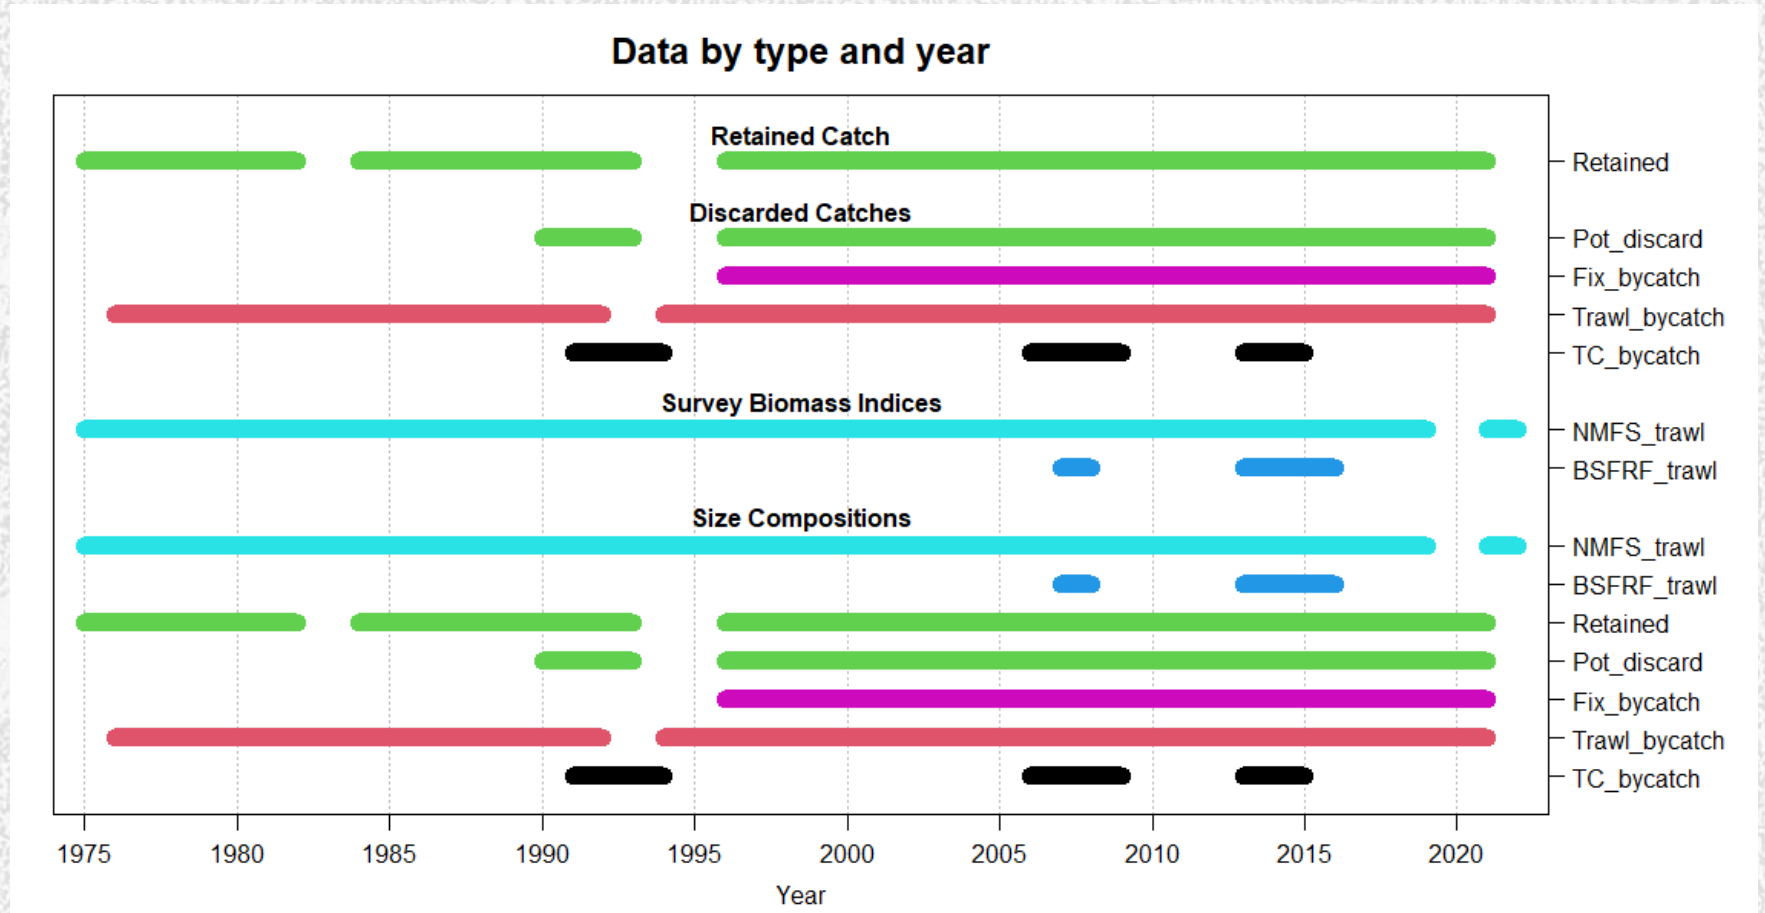

Summary

- Mature male biomass increase from 2021, still low compared to long term average
- Directed fishery was closed in 2021/22 season due to low mature female abundance.
- Estimated mature female biomass is higher than 2021 but still lower than it's been since the mid-90s
- 2022 mature female abundance does NOT meet the minimum threshold of mature female abundance (8.4 million) in the State Harvest Strategy
 - 2022 area-swept = 8.004
 - 2022 model estimate = 7.840
- Low recruitment in recent years (last 8-12 years), projected decline in biomass without a large recruitment event

CPT / SSC comments

- No new comments addressed this cycle
- Many addressed in May 2022, work will be continued for 2023 proposed model work
- Focus here on models recommended for specification in May 2022
- June 2022 comments:
 - Produce a stock structure template for RKC (June 2023)
 - CPT develop guidelines for when to change model start date (Jan 2023?)

Data
extent and

for 2022

Retained and bycatch mortality (t)

Survey legal male abundance and CPUE for directed BBRKC fishery

Length
composition
from NMFS
survey

Model explorations

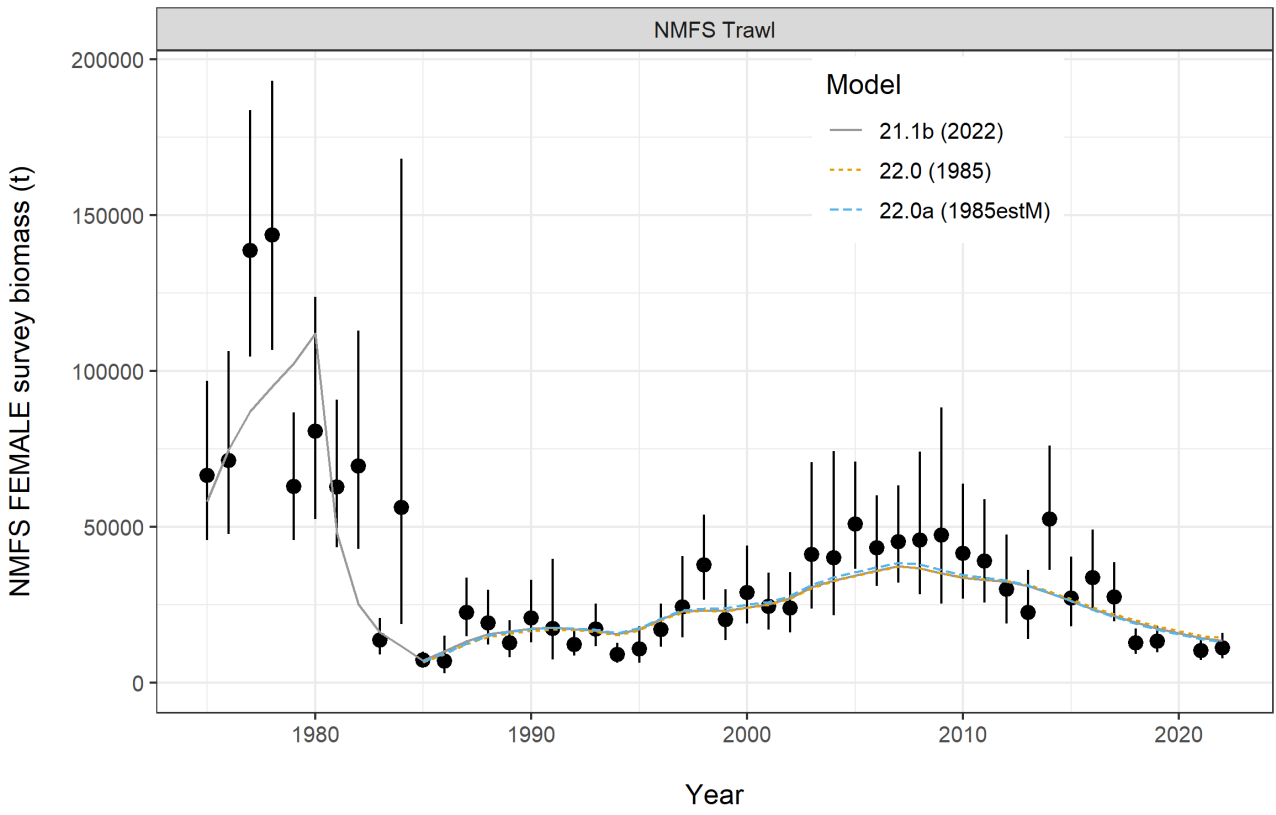

21.1b: model 21.1 (2021 accepted model – base M for males fixed at 0.18, mortality event in 80s)

+ **GMACS updated version** (version 2.01.E)

+ **updated groundfish fisheries bycatch** data.

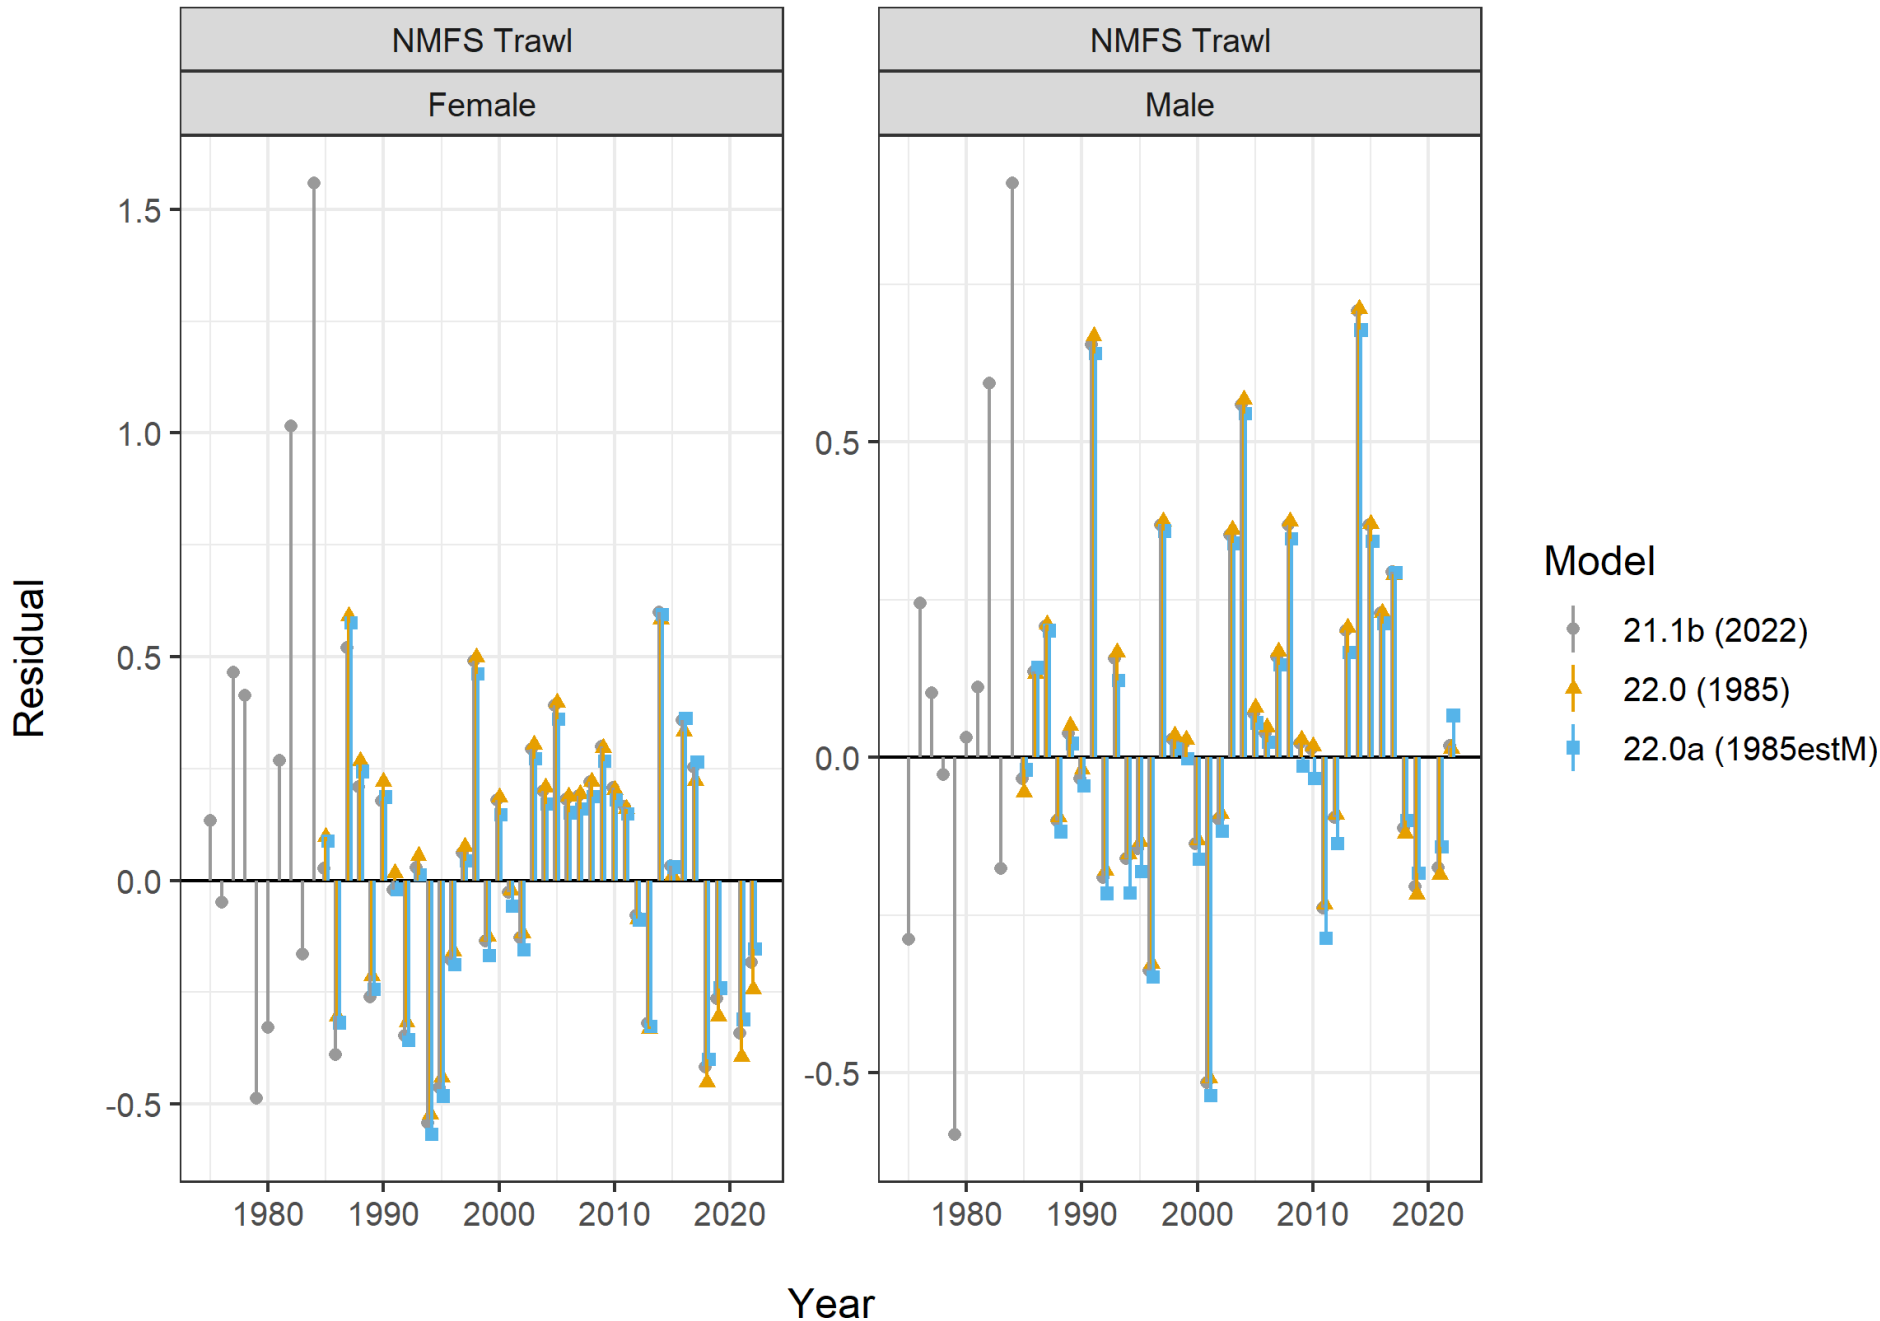

22.0: model 21.1b + starting in 1985.

22.0a: model 22.0 (start in 1985) + estimating a constant M for males.

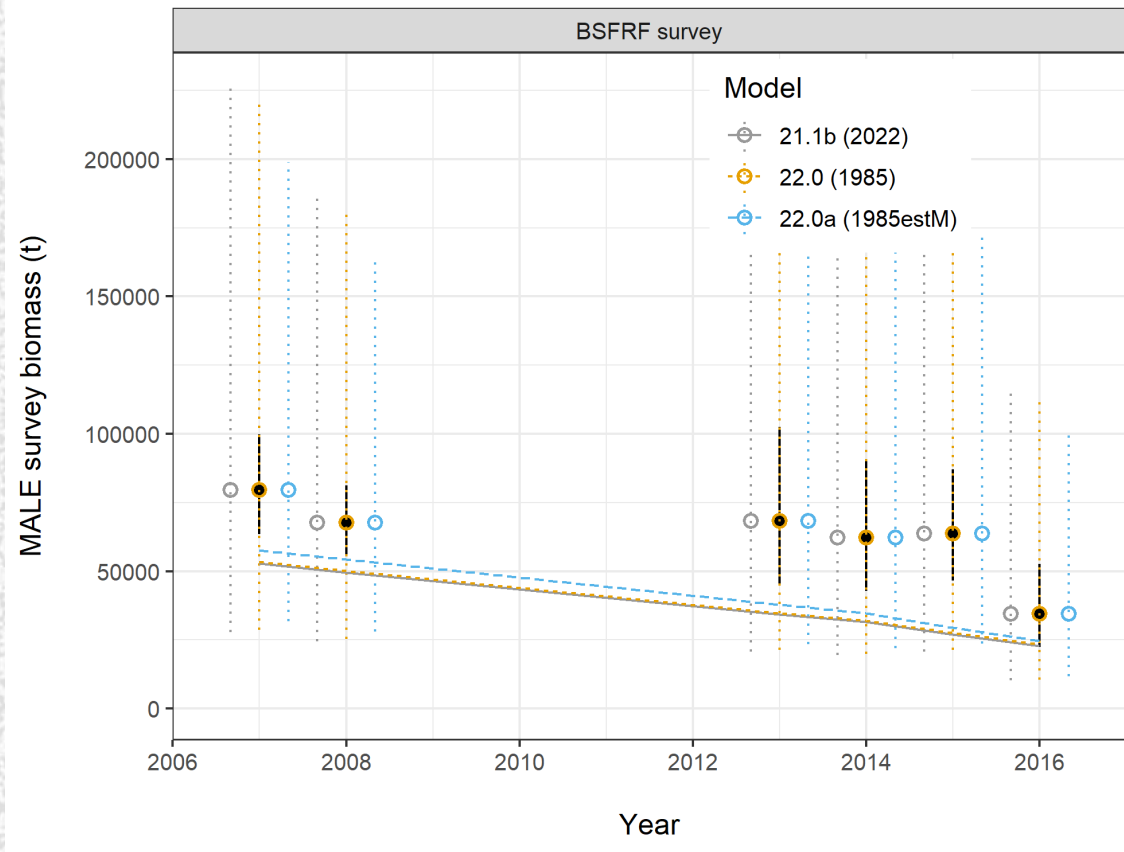

- Model fits to survey data are similar in all 3 models.

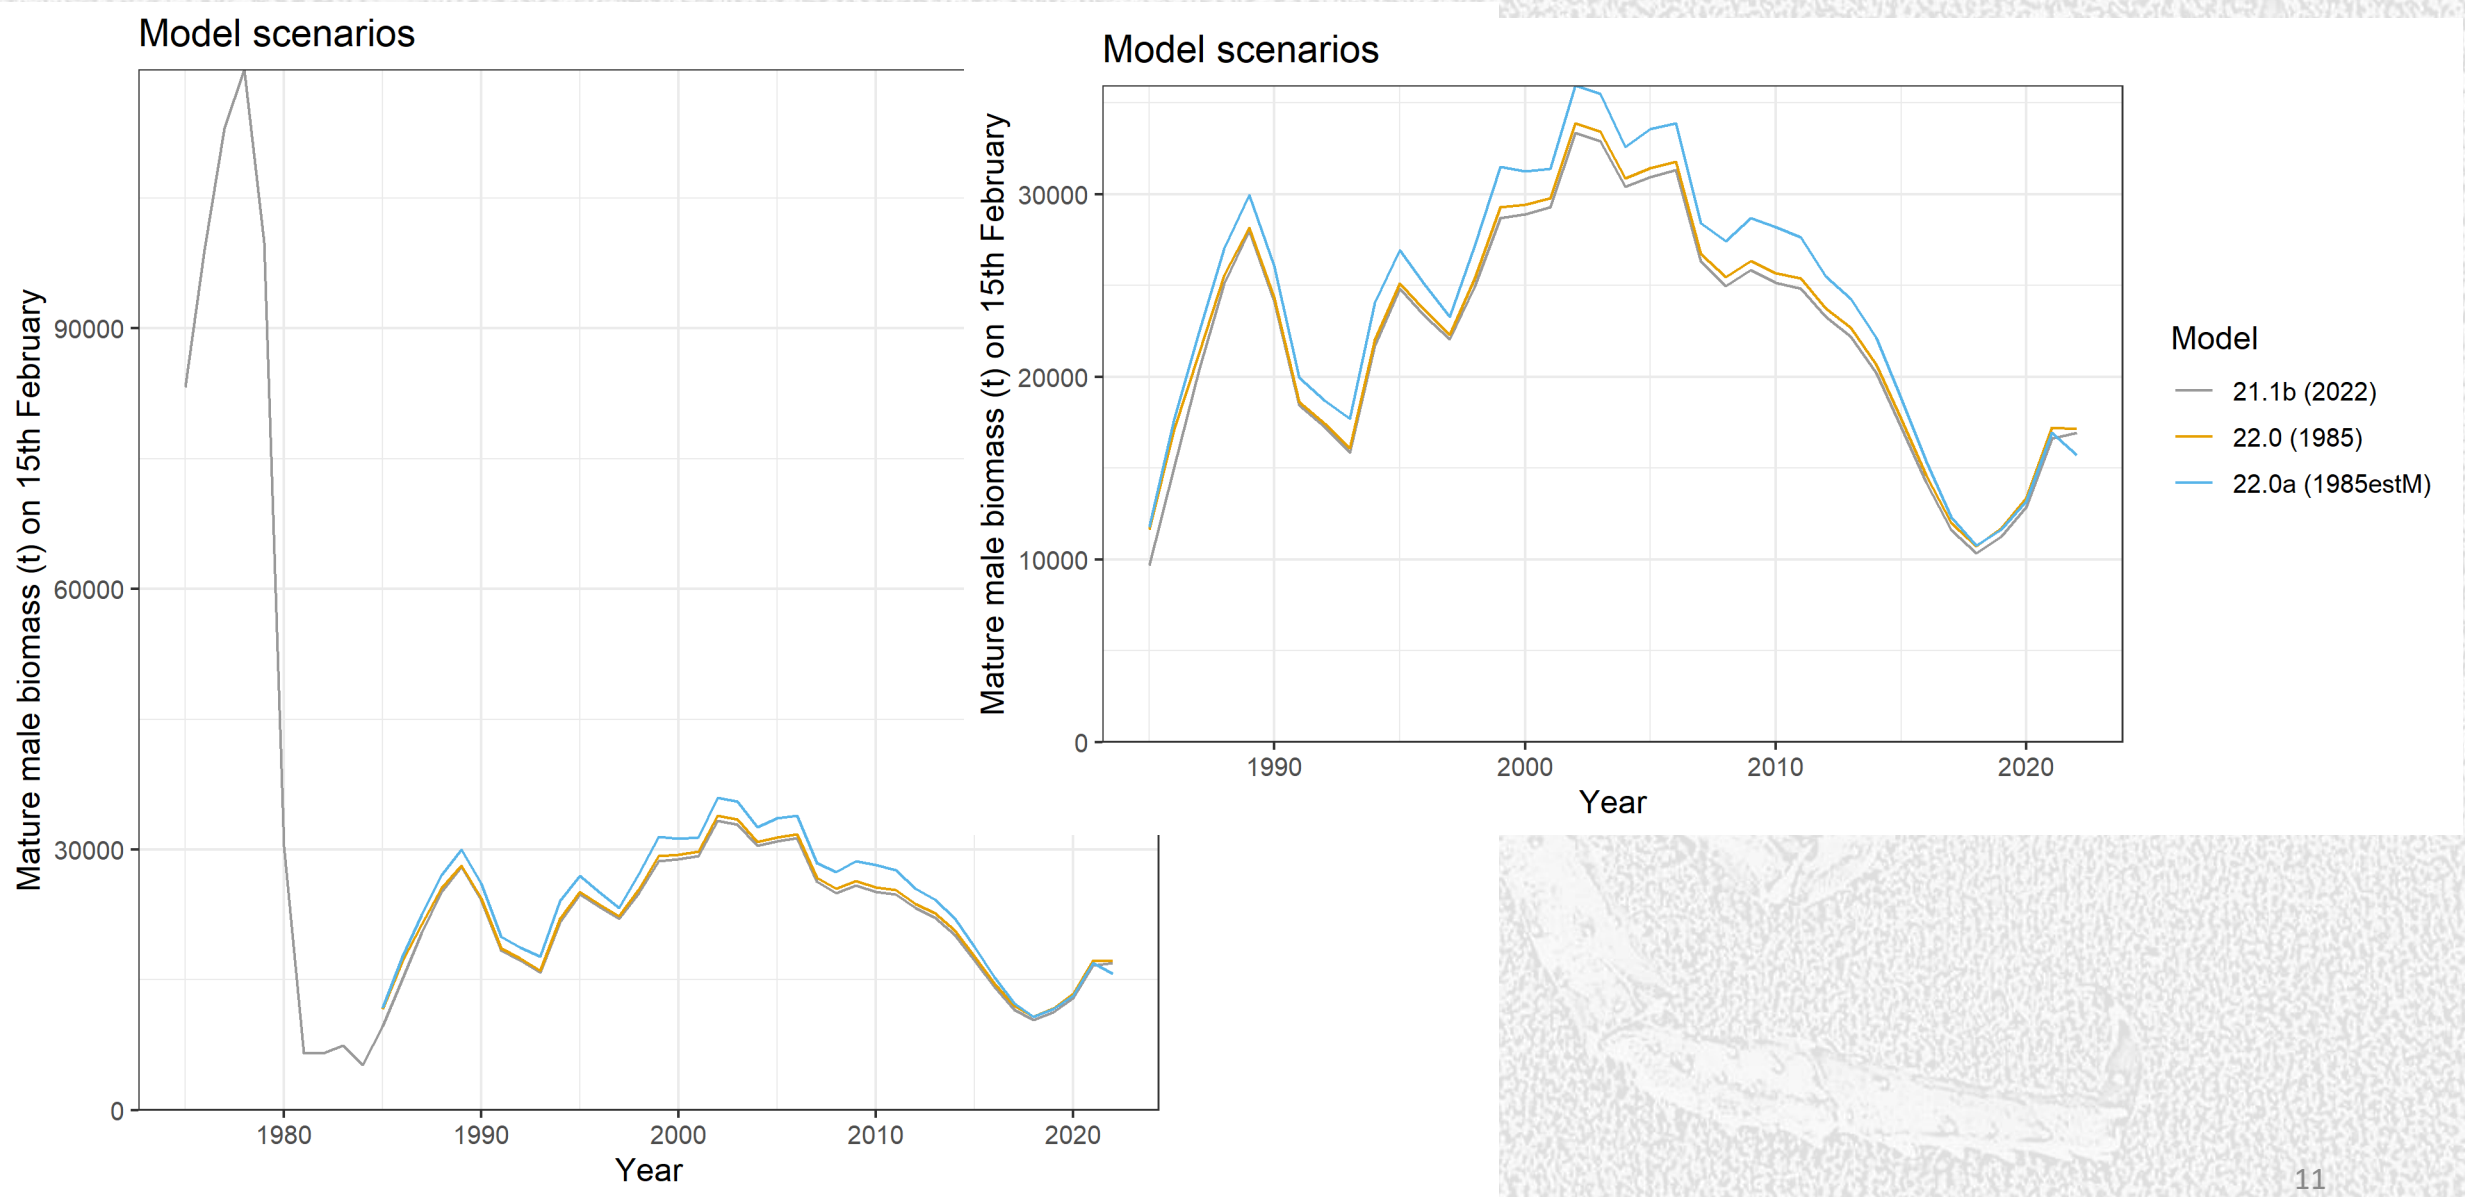

Residuals
of total
NMFS
survey
biomass

- Error bars show additional error
- BSFRF survey catchability is assumed to be 1.0
- Similar fits

Mature male biomass

Mortality biomass (equal to catch biomass times handling mortality rate)

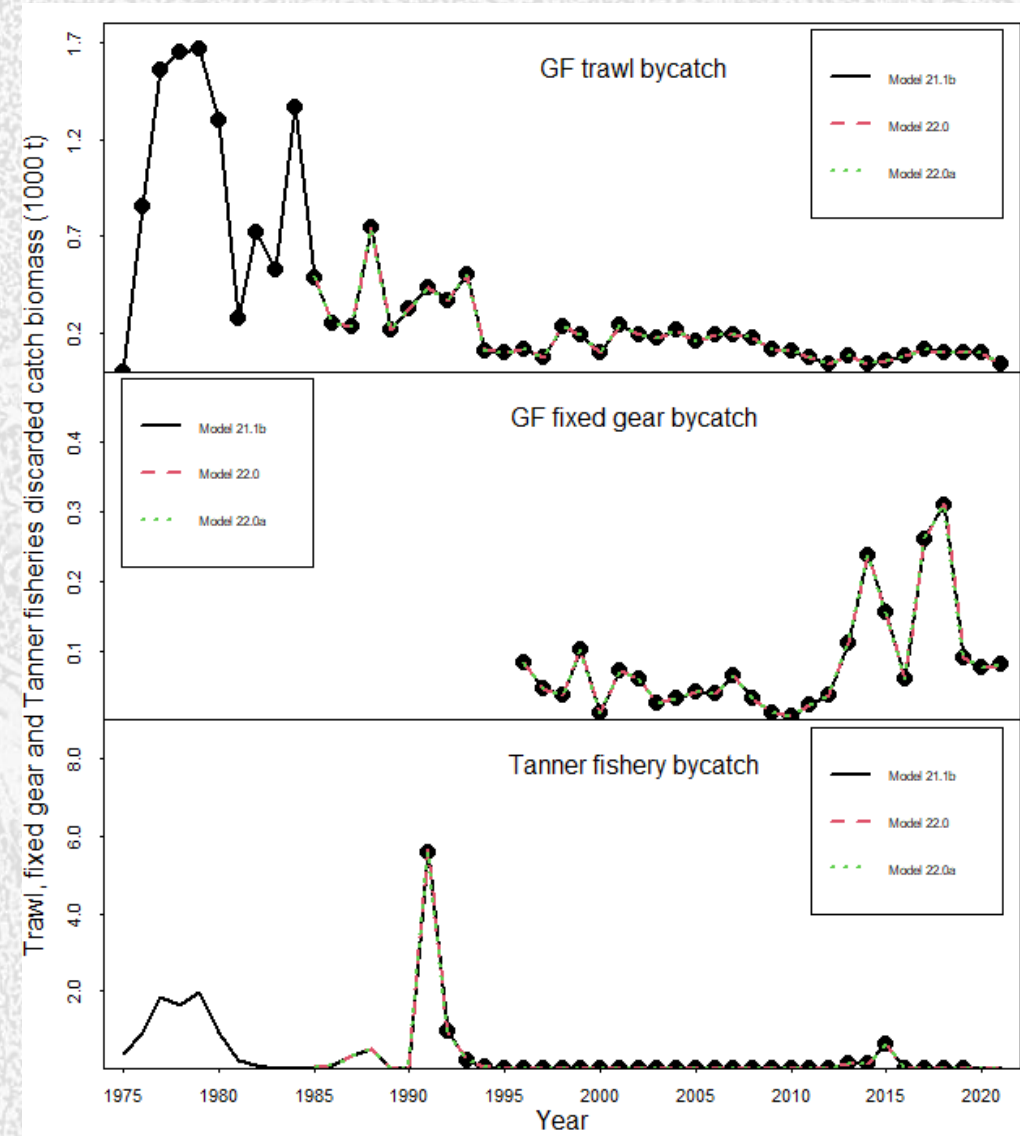

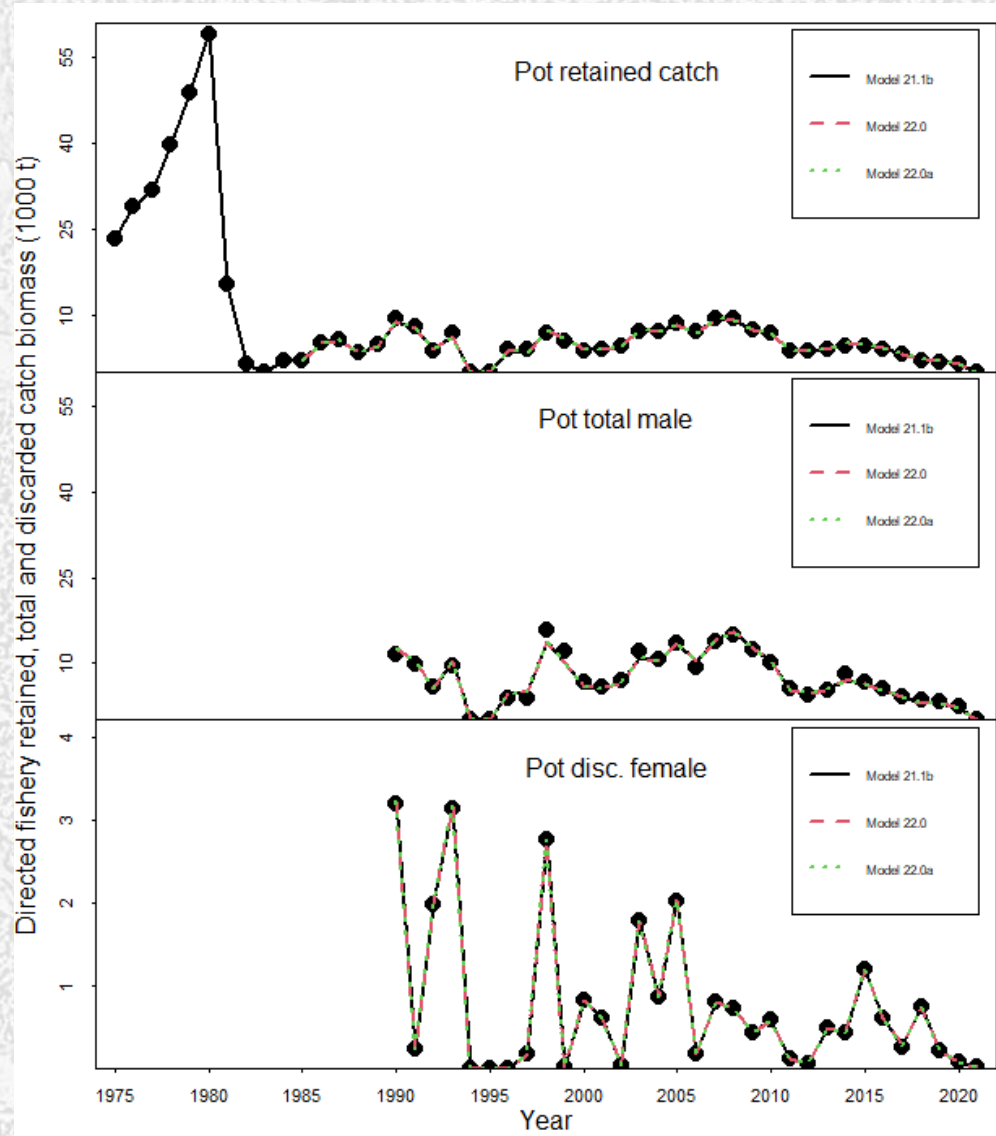

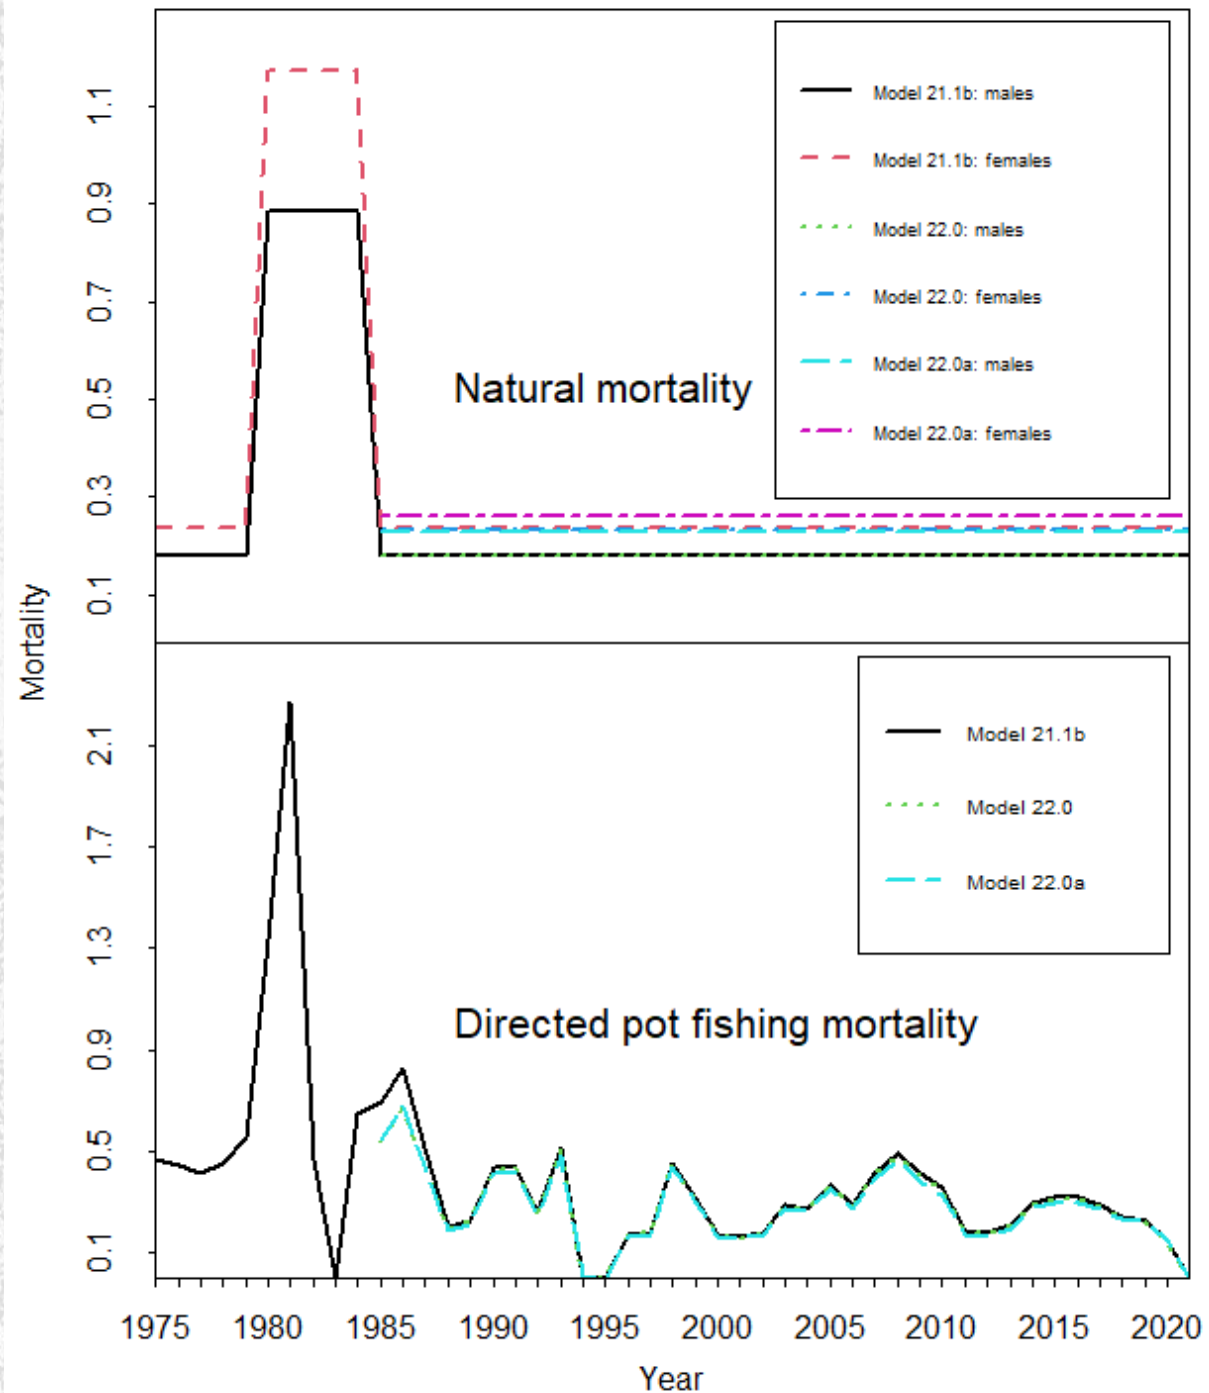

Table 7. Natural mortality estimates for three model scenarios during different year blocks.

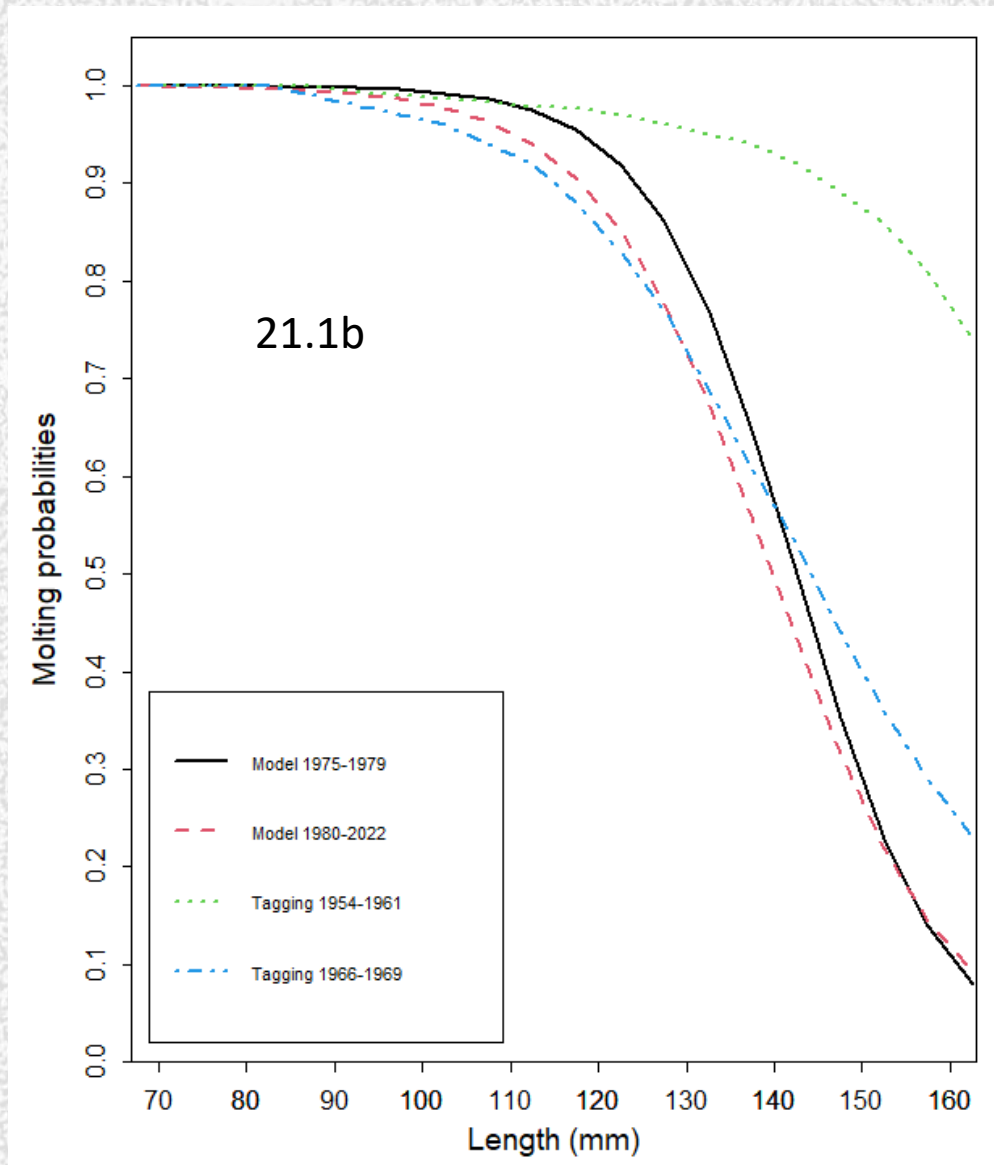

Model	Sex	1975-1979,		1985-2022
		1985-2022	1980-1984	
21.1b	Males	0.180	0.886	
	Females	0.238	1.174	
22.0	Males			0.180
	Females			0.232
22.0a	Males			0.228
	Females			0.261

Survey selectivity:
 - 22.0a
 (estimated base M)
 largest difference

Molting probabilities

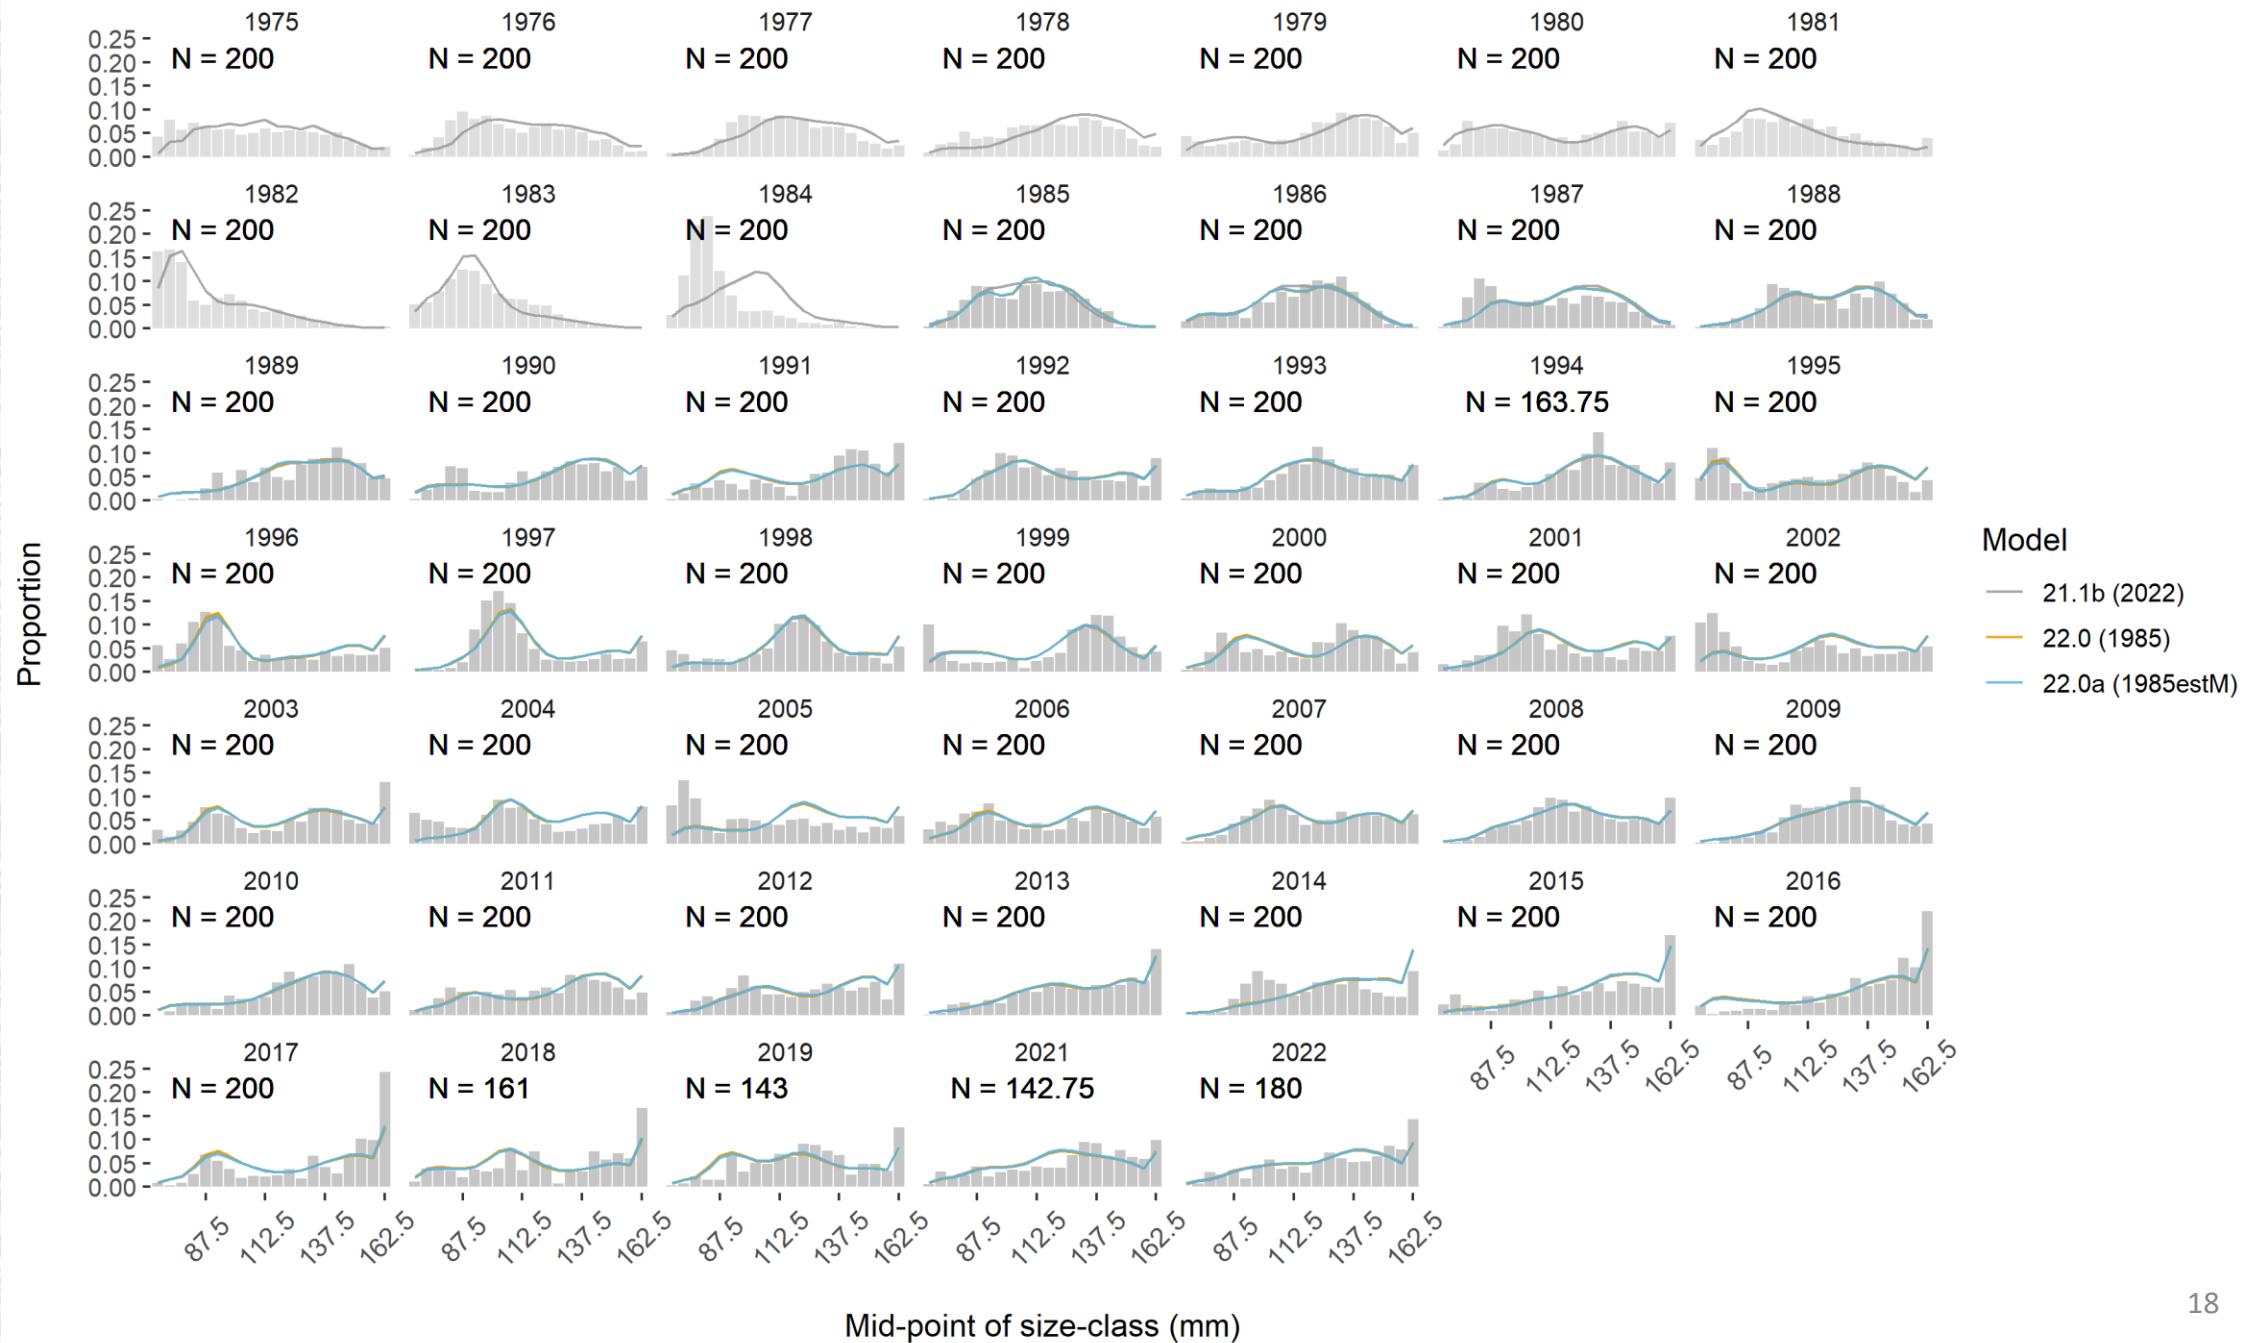

Size composition fit

- Similar for all models in bycatch and directed fisheries
- Survey selectivities are similar also (see next two slides)

Gear = NMFS Trawl , Sex = Female , Season = 1

Gear = NMFS Trawl , Sex = Male , Season = 1

Comparison of residuals for NMFS survey males

Model 21.1b, Survey Males

Model 22.0, Survey Males

Model 22.0a, Survey Males

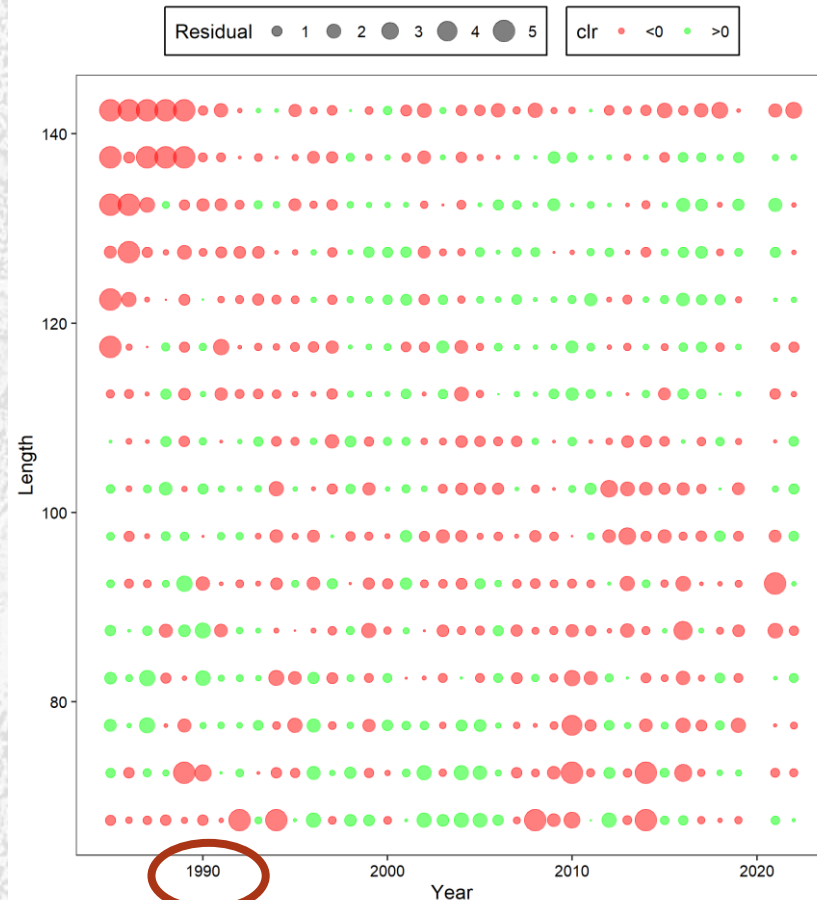

Comparison of residuals for NMFS survey females

Model 21.1b, Survey Females

Model 22.0, Survey Females

Model 22.0a, Survey Females

Recruitment

Recruitment to exclude from reference point calculations

Highlighted cells show prior density values and total negative likelihood values without prior densities

Retrospective analysis and projections

- Retrospective analysis – done for all model runs
- MCMC runs to look at model variability
 - Only performed for model 21.1b (base/reference model)
 - Time intensive – feasibility of this for all model runs?
- Projections
 - To inform population trajectory and the probability of “approaching an overfished condition”

Retrospective patterns

Model 21.1b

Model 22.0

Model 22.0a

MCMC output (Model 21.1b)

Cumulative probabilities of estimated ratios of MMB in 2022 to corresponding estimated $B_{35\%}$ values under model 21.1b with the MCMC approach.

Projections for future status (21.1b MCMC output) [2022 = projected MMB Feb 15th, 2023]

Model 21.1b

Last 6 years of size compositions NMFS survey data

Summary & Recommendations

- Models have similar output, some differences in model 22.0a due to estimated base M value for males
- Trend in mature male biomass similar except for terminal year for model 22.0a (not recommended for status determination, more investigation into changes in model output needed)
- Stock is not overfished in 2022 and not likely “approaching an overfished condition” in the next two years
- Recommend reference (base) model 21.1b for status determination
 - Model 22.0 is a potential transition but need a unified (for all stocks) approach to a starting date for models/data (SSC recommendation)

Status and catch specifications (1,000 t) (model 21.1b):

Year	MSST	Biomass (MMB)	TAC	Retained Catch	Total Catch	OFL	ABC
2018/19	10.62 ^B	16.92 ^B	1.95	2.03	2.65	5.34	4.27
2019/20	12.72 ^C	14.24 ^C	1.72	1.78	2.22	3.40	2.72
2020/21	12.12 ^D	13.96 ^D	1.20	1.26	1.57	2.14	1.61
2021/22	12.01	16.64	0	0.02	0.10	2.23	1.78
2022/23		16.95				3.04	2.43

Basis for the OFL: Values are in 1,000 t (model 21.1b):

Year	Tier	B_{MSY}	Current MMB	B/B_{MSY} (MMB)	F_{OFL}	Years to define B_{MSY}	Natural Mortality
2018/19	3b	25.5	20.8	0.82	0.25	1984-2017	0.18
2019/20	3b	21.2	16.0	0.75	0.22	1984-2018	0.18
2020/21	3b	25.4	14.9	0.59	0.16	1984-2019	0.18
2021/22	3b	24.2	14.9	0.62	0.17	1984-2020	0.18
2022/23	3b	24.03	17.0	0.71	0.20	1984-2021	0.18

Buffer considerations

- Current at 20% - recommend 20% for upcoming year
- Cold pool distributional shifts
- Declining trend or low levels of mature male biomass and mature female biomass
- Lack of recruitment events
- Retrospective pattern
