# Update on EBS Pollock assessment plans for 2022

---

Jim Ianelli

Alaska Fisheries Science Center

# Today

- No model changes
  - Added features to accommodate ACLIM projections (courtesy Paul Spencer)
    - Includes posterior predictive distributions
  - Continue to test alternatives for comparison (e.g., WHAM, SAM, SS, AMAK)
    - Key features (e.g., covariance spec on BTS survey time series)
- Survey weight-at-age estimation
  - Affects conversion of model N-at-age to predicted survey biomass (and hence fits)
  - Adds to the estimate of current-year fishery weight-at-age and projections

# Survey body-mass-at-age

- 2021 Method (old)

For  $i^{th}$  year,  $j^{th}$  age:

$$W_{i,j} = \frac{\sum^k N_{ijk} a_k L_a^{b_k}}{\sum^k N_{ijk}}$$

Where  $k$  indexes sex (unid, male, female)

- Problem is it only captures inter-annual variation due to length
- Subsequently less missing years of L-W data from survey

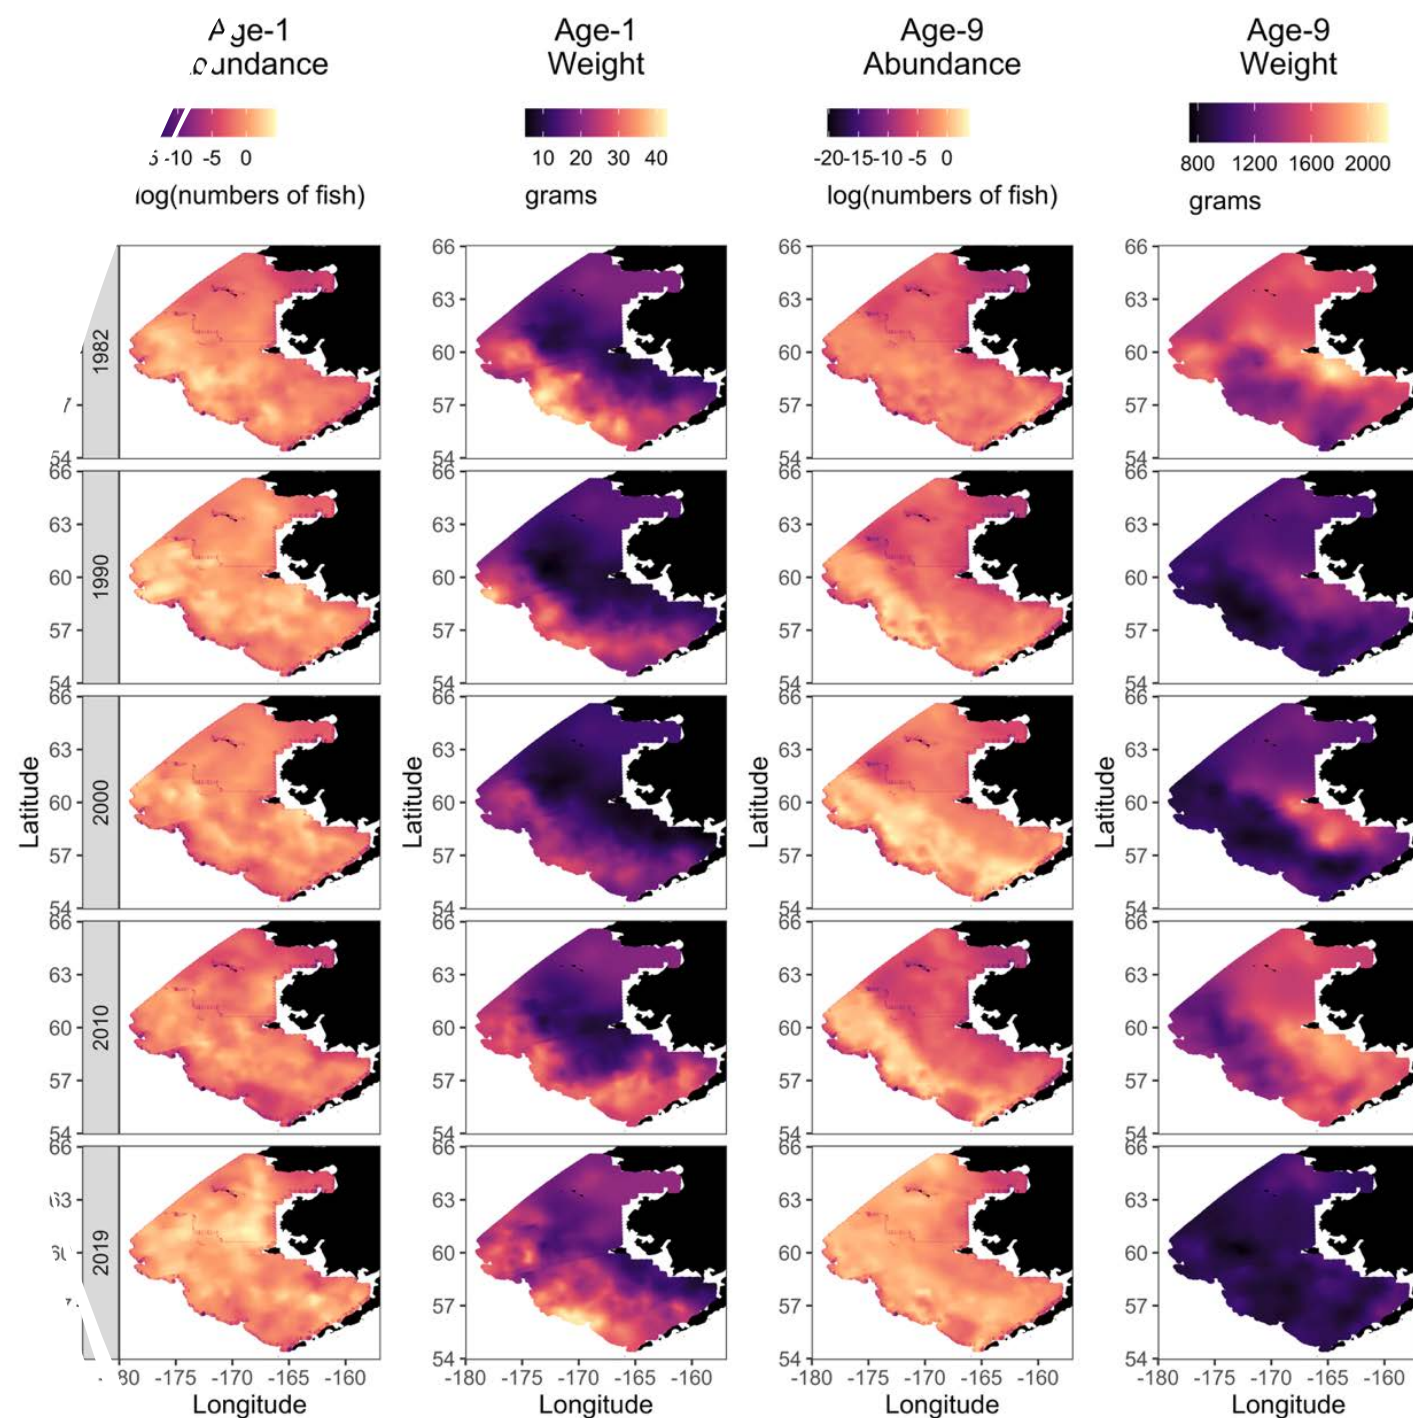

```
# These the LW coefficients from RACE (CA 1999)
b_m <- 3.038; a_m <- 0.000004919
b_f <- 2.986; a_f <- 0.000006681
b_u <- 2.9954; a_u <- 6.3611E-06
```

YEAR	SEX	AGE	POPULATION	MEAN_LENGTH	SD_LENGTH

# Survey body-mass at age re-evaluation

- Study by Julia Indivero
- Goal to make survey wt-at-age consistent w/ other SDM estimates

$$\log(w_{g_i, a_i, y_i}) = \underbrace{\beta_{a_i, y_i}}_{\text{Temporal variation}} + \underbrace{\omega_{a_i, g_i}}_{\text{Spatial variation}} + \underbrace{\varepsilon_{g_i, a_i, y_i}}_{\text{Spatio-temporal variation}}$$

# Indivero study objectives

1. What is the spatial and temporal pattern of size at fine-scale (i.e. local) and population-scale (i.e. index)?
2. Do local spatial and spatio-temporal variation impact index size-at-age?
3. Does local variation in size matter more than abundance for index size-at-age?
4. How does our model of population size-at-age affect the stock assessment estimate of population biomass compared to a non-spatial naïve estimate?

# Bonus feature of new method—estimates of uncertainty in wt-at-age

- Useful in supplementing fishery mean-wt-at-age projections
  - Year and cohort effects

# Added feature

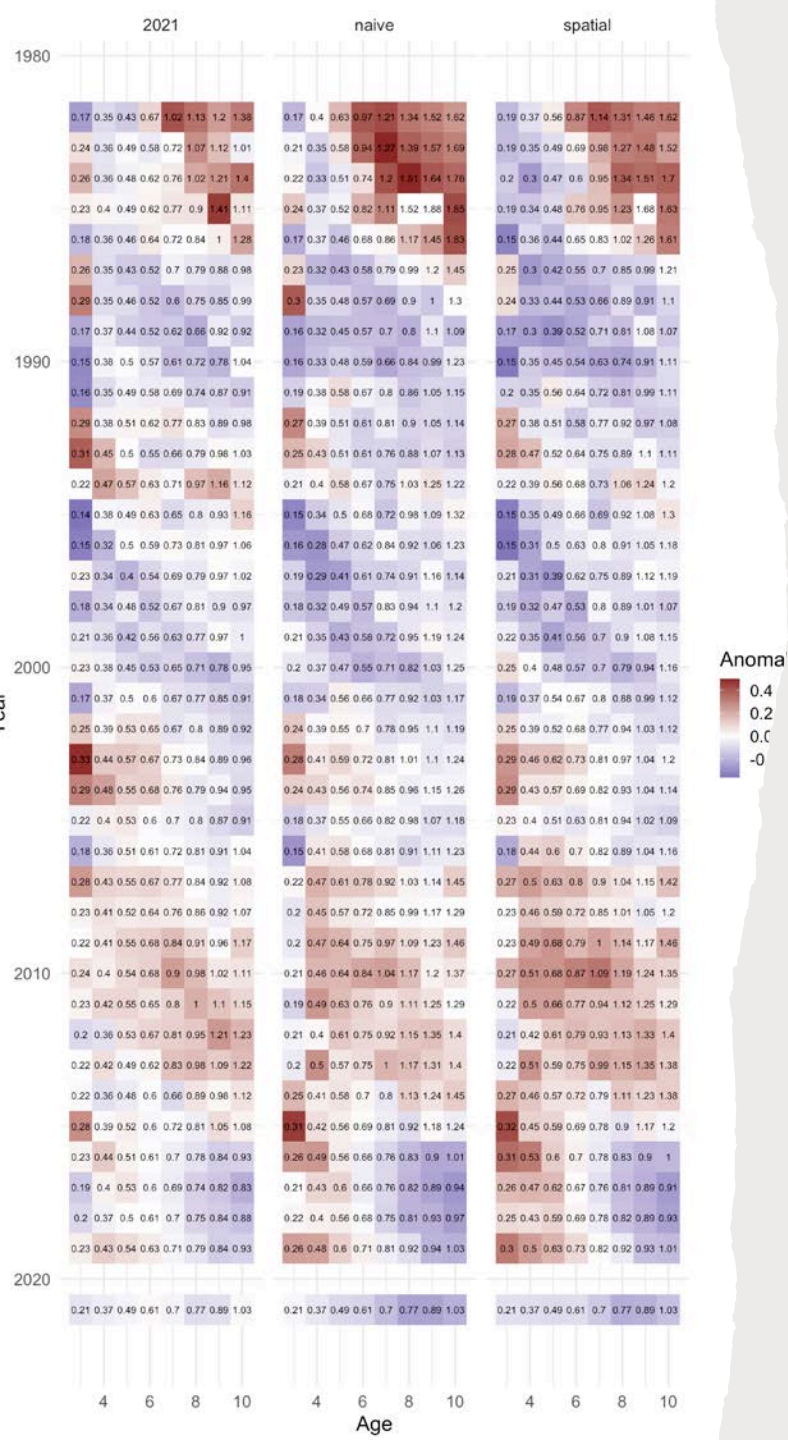

- Useful for aiding the fishery mean-wt-at-age projections
  - Year and cohort effects

Courtesy Julia Indivero, In Review

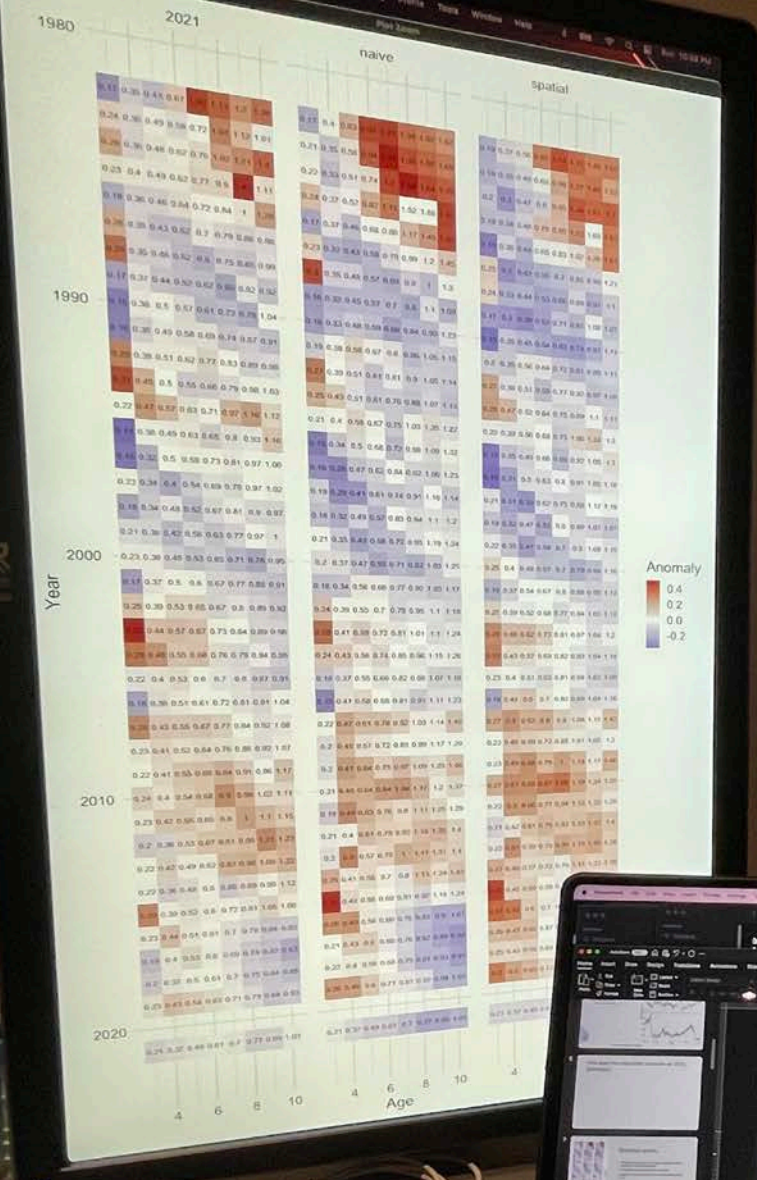

How does the evaluation compare w/ 2021  
Estimates?

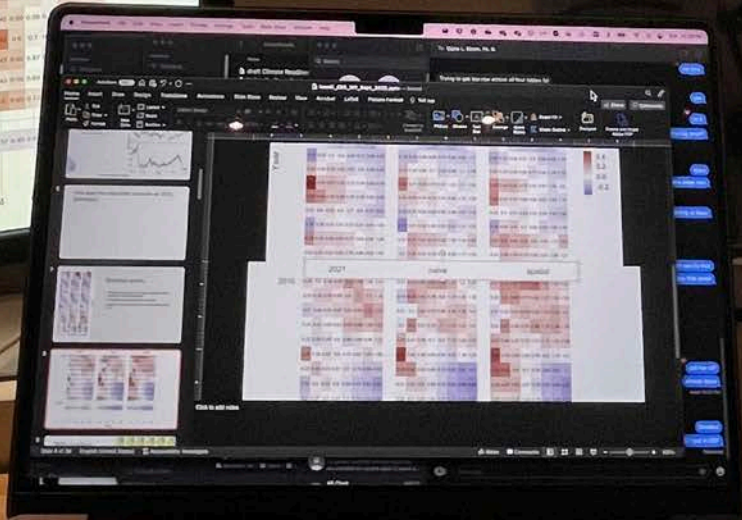

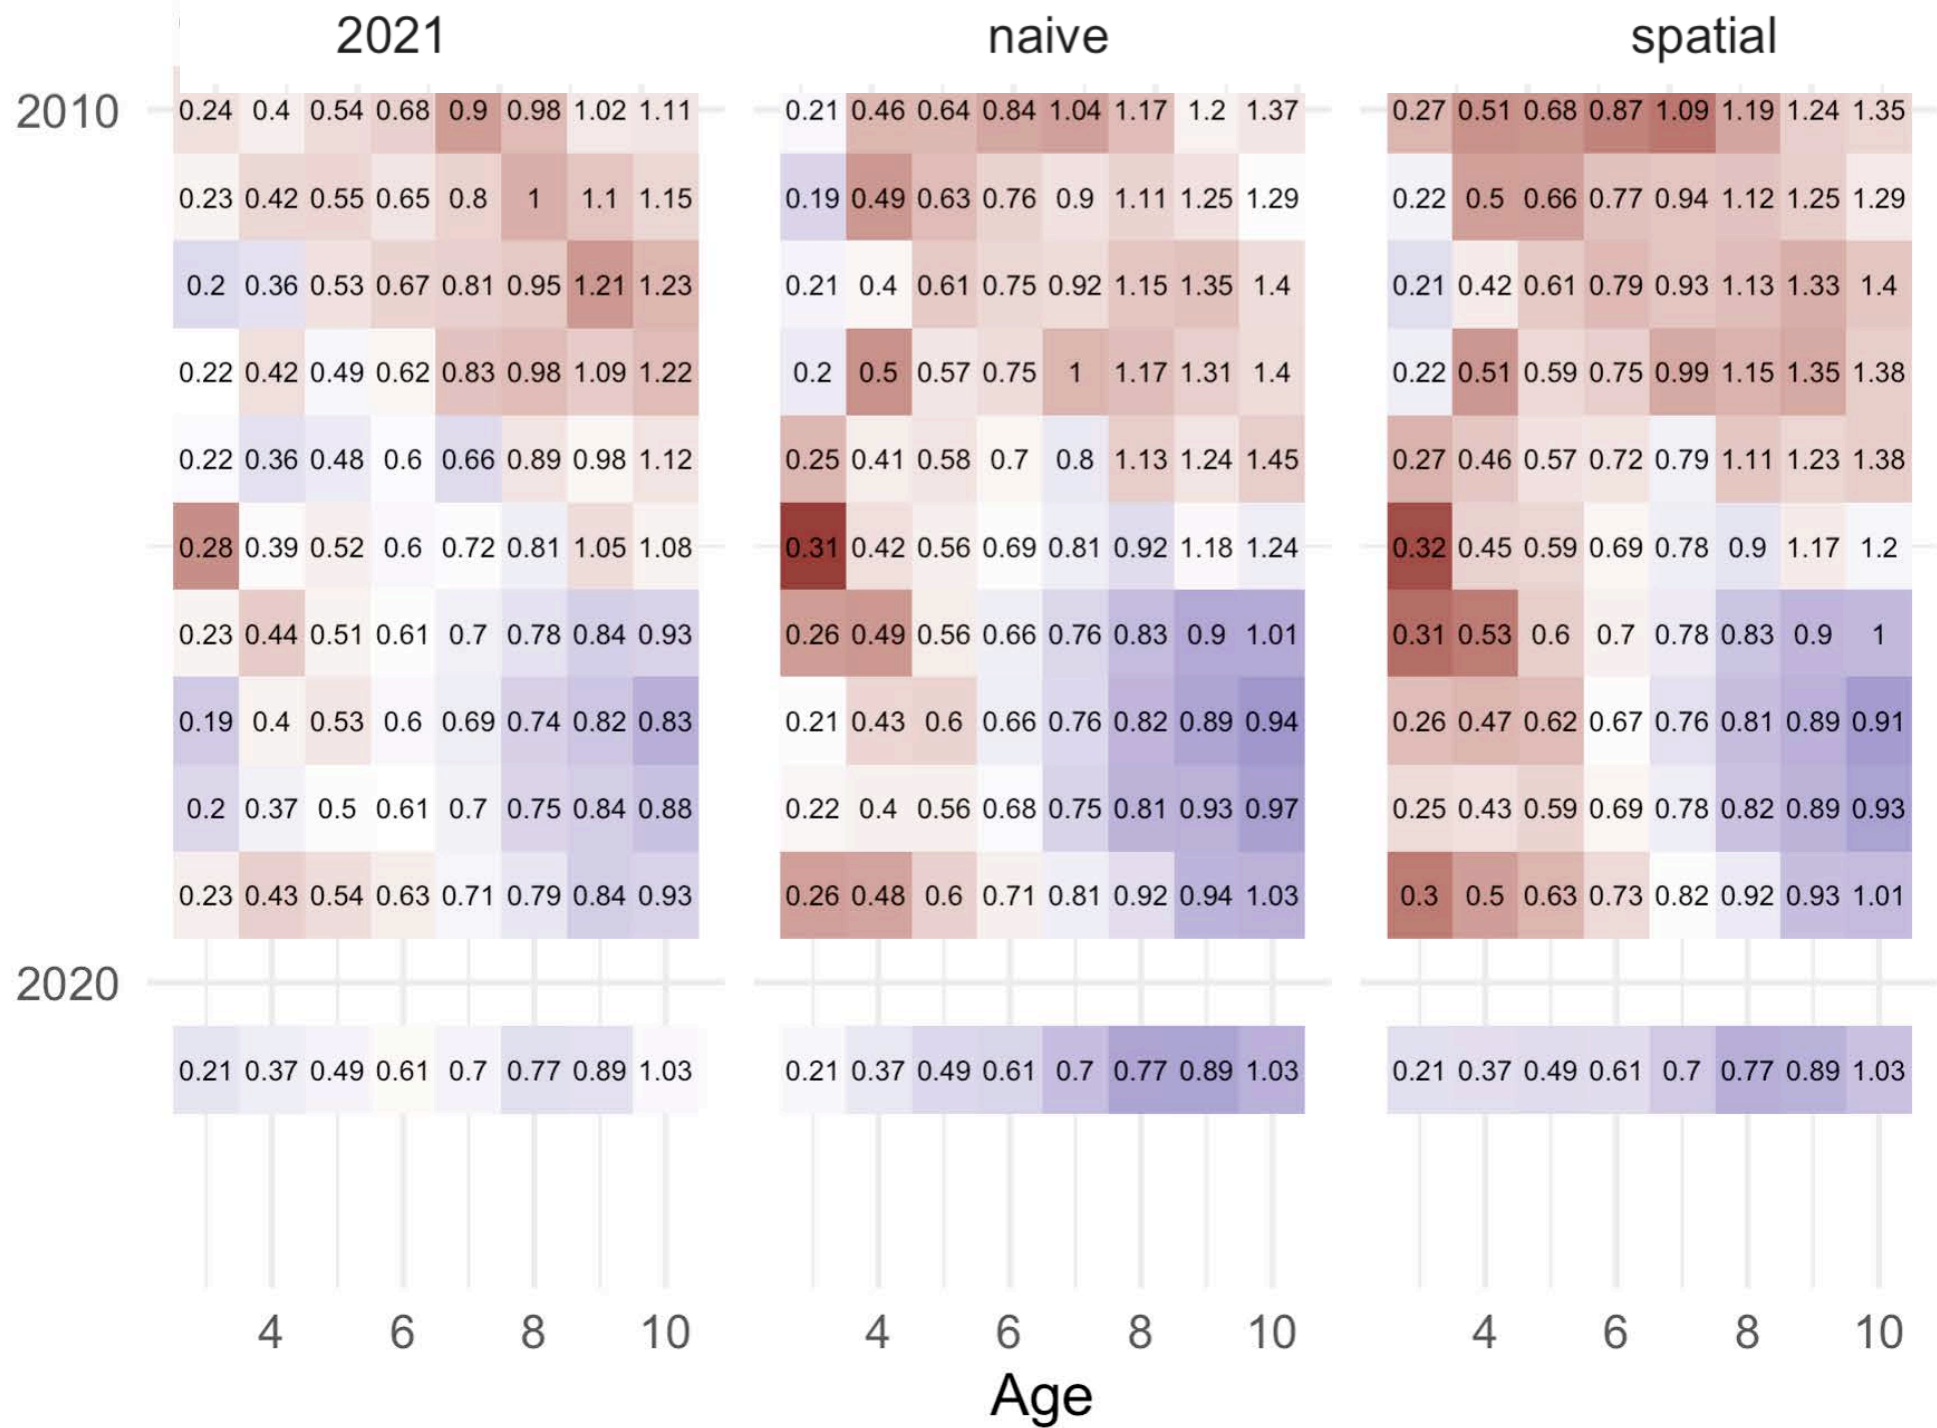

# Relatively poorly...

- Traditional method went from length to weight with fixed, sex-specific wt-length parameters
- This affected the predicted biomass estimates within the model
- In general, old way tended to have anomalies closer to the mean...

# Indivero et al.

- Effect of spatial vs simple mean estimates on assessment results

Last year's 2021 assessment fits and abundance estimates

From Indivero et al. (submitted)

*“Results from our case study suggests that accounting for spatially unbalanced sampling improved stock assessment consistency. Additionally, it improved our understanding on the dynamics of how local and population-level demographic processes interact. As climate change affects fish distribution and growth, integrating spatiotemporally explicit size-at-age processes with anticipated environmental conditions may improve management advice.”*

# Summary

I recommend

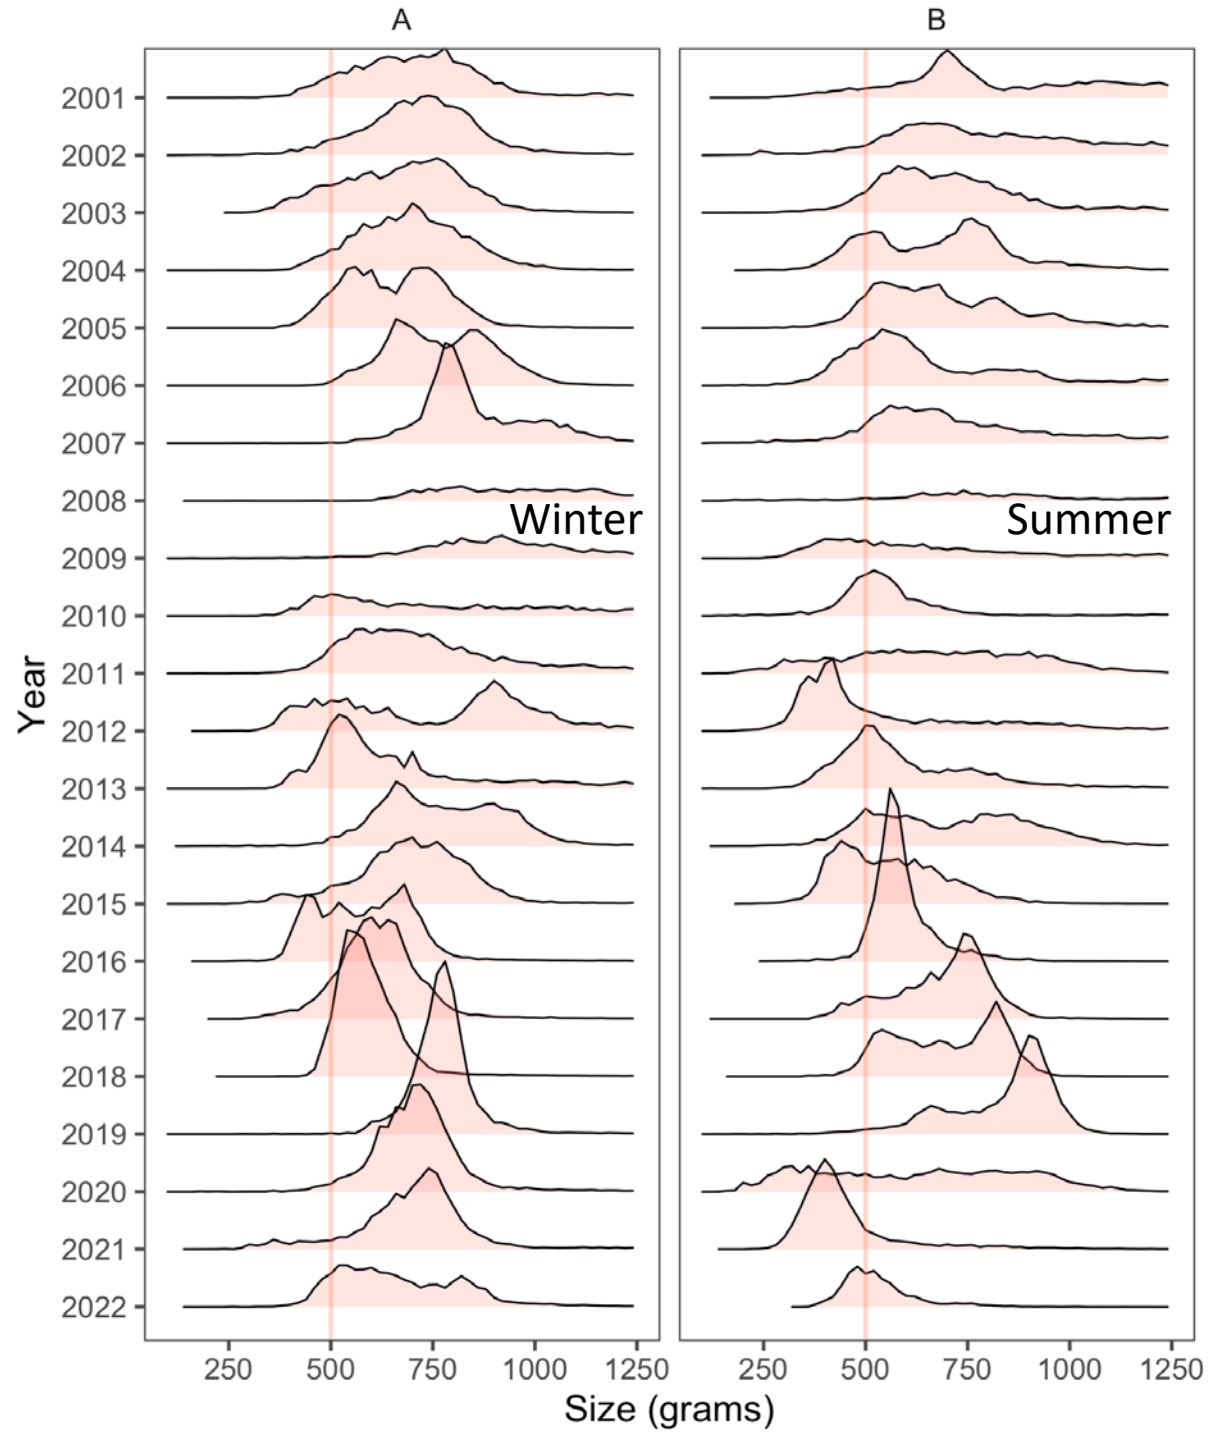

- Abandoning the old L-W relationship and mean length way of computing mean body-weight-at-age to fuller spatial data extent
- Adopting new approach that is most consistent with the VAST data
- For design-based tests (and alternative model runs), use the spatially naïve estimates (in place of old LW approach)

# Summary on spatial distributions

I recommend

- Continue to evaluate the interaction of spatial distribution of the fishery and the relative selectivity
  - Particularly as it pertains to  $F_{MSY}$  estimates and uncertainty

# Other initiatives coming in November

Make the calculations of Tiers 1, 2, and 3 more transparent

- SSC and others (including me!) had difficulty tracking down calcs

AVO, ATS, and BTS (EBS + NBS) survey data should all be available

- Age data from 2021 fishery + 2022 BTS data as well

2011 assessment MEY calculation to be revisited?

Closer look at EM data (for spatial analyses)
