The authors of the BSAI King and Tanner Crab SAFE Economic Status Report invite users to provide feedback regarding the quality and usefulness of the Report and recommendations for improvement. AFSC's Economic and Social Sciences Research Program staff maintain continuous efforts to revise the SAFE Economic Status Reports for Alaska Groundfish and BSAI Crab to incorporate additional analytical content and synthesis, improve online accessibility of public data in electronic formats, and otherwise improve the utility of the reports to users. We welcome any and all comments and suggestions for improvements to the SAFE Economic Status Reports. Please address comments and suggestions to Brian Garber-Yonts (contact information below).

This report will be available at:

<http://www.afsc.noaa.gov/refm/Socioeconomics/SAFE/default.php>

Time series of data for the tables presented in this report (in CSV format) are available at:

3.50 Inflation-adjustment indices	202

ABSTRACT

This report presents information on economic activity in commercial crab fisheries currently managed under the Federal Fishery Management Plan (FMP) for Bering Sea and Aleutian and Islands King and Tanner Crab (BSAI crab), with attention to the subset of fisheries included in the Crab Rationalization (CR) Program. Statistics are provided on harvesting and processing activity and effort; production, revenue and prices; labor employment and compensation; operational costs and economic performance; and quota ownership, usage and disposition among participants in the fisheries.

ECONOMIC STATUS REPORT EXECUTIVE SUMMARY: BSAI CRAB FISHERIES, 2020

The Economic Status Report for BSAI Crab Fisheries, 2020 (Crab Economic SAFE) provides detailed information regarding production, sales, revenue, and price indices in the harvesting and processing sectors, income, employment, and demographics of labor in both sectors, capital and operating expenditures in the fishery, quota share lease and sale market activity, changes in distribution of quota holdings, productivity in the harvesting sector, U.S. imports and exports of king and Tanner crab, and other information regarding data collection and ongoing economic and social science research related the BSAI crab fisheries and related communities. This executive summary highlights three sets of primary indicators describing aggregate changes in gross volume and value of production, labor earnings and employment in the crab processing and harvesting sectors, and crab harvest quota leasing activity.

Of the 10 crab stocks and 11 fisheries managed under the North Pacific Fishery Management Council's Fishery Management Plan (FMP),¹ seven fisheries were open to targeted fishing during 2019, including the Bristol Bay red king crab (BBR) and Norton Sound red king crab (NSR) fisheries, Eastern and Western Aleutian Islands golden king crab (EAG/WAG) and Pribilof Islands golden king crab (PIG) fisheries, the Bering Sea snow crab (BSS) fishery, and Western Bering Sea Tanner crab (WBT) fisheries. The latter was open for the 2018/19 crab season, much of which was prosecuted during the early months of 2019, and was subsequently closed for the 2019/20 season before opening again for 2020/21. Both the Eastern Bering Sea Tanner (EBT) and Saint Matthew blue king crab (SMB) fisheries have been closed since the 2016/17 crab season. The SMB fishery was declared to be overfished in October, 2018 and a rebuilding plan for the fishery was adopted by the Council in June, 2020, and issued as Amendment 50 to the FMP by NMFS in October, 2020 (85 FR 71272). The Western Aleutian red king crab fishery has been closed since 2003/04, and the Pribilof Islands red and blue king crab have been closed since 1999, and are both currently designated overfished.

Fishery production and economic value

The Bering Sea/Aleutian Islands (BSAI) crab fisheries managed under the FMP are currently (as of calendar year 2019) prosecuted by an active fleet of 89 catcher vessels and two catcher processors, and landed and processed at 14 processing facilities throughout the region. Across all fisheries managed under the BSAI Crab FMP during 2019, the total volume of ex-vessel landings was 39

¹There are currently 11 distinctly managed fisheries on the 10 crab stocks managed under the FMP; catch allocations and other management elements are administered separately for the Eastern and Western components of the Bering Sea Tanner crab stock, and for the Eastern and Western components of the Aleutian Islands golden king crab stock, and the Pribilof Island blue and red king crab stocks are managed collectively as a single fishery. For fisheries characterized by a small number of participating entities, individual statistics where indicated in Tables 1 - 3, and elsewhere in the report, are suppressed due to confidentiality restrictions; this includes most values for the Pribilof Island golden king (PIG) crab fishery and the Norton Sound red king (NSR) crab fisheries, and statistics for both Aleutian Islands golden king crab fisheries and both Bering Sea Tanner crab fisheries are reported in aggregate, respectively. Values that are indicated as suppressed for a specific fishery are also excluded from values reported in aggregate over multiple crab fisheries. Except where noted, the suppressed values are sufficiently small that they have minimal effect on the accuracy of aggregate information at the level of precision reported here.

million pounds (17.7 thousand metric tons), a 22% increase from the previous year. Processing sector finished production volume during 2019 was 25.5 million pounds (11.6 thousand mt) aggregated over all BSAI crab species and product forms, also increasing 22% from the previous year. The effect of a net increase in production volume across crab fisheries, combined with changes in market prices, produced an aggregate 18% increase in ex-vessel revenue over all fisheries in 2019, totaling \$202 million for the year, and with aggregate first wholesale revenues also increasing by 18% to \$242 million.²

Harvest and processing sector production statistics by crab fishery, including ex-vessel and first wholesale output, estimated revenue, and average prices are shown in Table 1 for calendar years 2015 through 2019 and summarized in Figure 1, with ex-vessel and first wholesale prices shown in Figure 2.

As of 2019, allowable catch quantities in all BSAI crab fisheries currently open to targeted fishing are fully exploited (> 98% of total allocation landed), and recent inter-annual variation in commercial landings largely reflects the results of stock assessments and the State of Alaska's specified catch limits rather than changes in fishing capacity or exploitation rates. The increase in aggregate production during 2019 reflected increases across two of the three largest crab fisheries compared to 2018. The total catch of 27.2 million pounds (12.4 thousand mt) landed in the Bering Sea snow crab (BSS) fishery was an increase of 45% from 21.3 million pounds in 2018, which was a historical low for the fishery, and the 6.8 million pounds (3.0 thousand mt) landed in the Aleutian Islands golden king crab (AIG) fisheries during 2019 was a modest 4% increase from 2018 production. Landings in the Bristol Bay red king crab (BBR) fishery declined 11% to 3.8 million pounds (1.7 thousand mt), and landings in the western portion of the Bering Sea Tanner (BST) fisheries during 2019 declined 48% relative to 2018 levels, to 1.2 million pounds (0.54 thousand mt), reflecting closure of the fishery during the 2019/20 season as well as a modest reduction in the 2018/19 BTW TAC compared to the prior season.

Similar to ex-vessel production, the 22% increase in processing sector output volume aggregated over all active crab fisheries was driven in the largest part by increased production in the BSS fishery during 2019, with finished volume of 17.9 million pounds (8.1 thousand mt) increasing 45% over the previous year, as well as a 4% increase in finished volume in the AIG fishery to 4.3 million pounds (1.95 thousand mt), together offsetting finished output declines of 11% and 48% in the BBR and BST fisheries, to 2.6 million pounds (1.2 thousand mt) and 1.2 million pounds (0.54 thousand mt), respectively.

With respect to aggregate revenues accruing to active participants within the harvesting and processing sectors, increases in ex-vessel and first wholesale prices in the BBR and BST fisheries partially offset the effect of production declines on aggregate value, while both prices and volume increased in both sectors of the AIG fisheries, and prices declined moderately in the BSS fishery. The average BBR ex-vessel price increased 13% in 2019 to \$11.87 per pound, and the first wholesale price increased 10% to \$19.96 per finished pound. The average first wholesale price in the AIG fishery increased 6% to \$13.12 per pound, while ex-vessel price increased by 2.6% to \$6.42 per pound landed. Both ex-vessel and first wholesale prices in the BST fishery increased 6.5% from

²All monetary values in the report, unless otherwise noted, are inflation-adjusted to 2019-equivalent dollars using the GDP-chaintype price index (<https://research.stlouisfed.org/fred2/series/GDPCTPI>). The GDP price index is used to adjust fishery production revenues and costs to account for the change in general US production prices over time.

2018, to \$4.48 ex-vessel and \$9.02 at first wholesale. BSS prices declined by less than 2% in 2019, to \$3.98 average ex-vessel, and \$7.12 average first wholesale.

In terms of gross production value, increased production in both sectors of the BSS fishery during 2019 offset the modest decline in prices, producing gross revenue in the harvest sector of \$108 million and \$127 million in the processing sector, up 42% and 43% from the previous year. Ex-vessel revenues in the AIG fisheries increased 7% from 2018, to \$44 million, and by 11% in the processing sector, to \$57 million. Gross ex-vessel earnings in the BBR fishery during 2019 increased slightly (+0.6%) to \$44.8 million, while first wholesale value declined by 2% to \$50.8 million. Gross production value in both sectors of the BST fishery declined substantially during 2019, with \$5.3 million ex-vessel and \$7.3 million in the processing sector declining by 45% and 41%, respectively.

Employment and Income

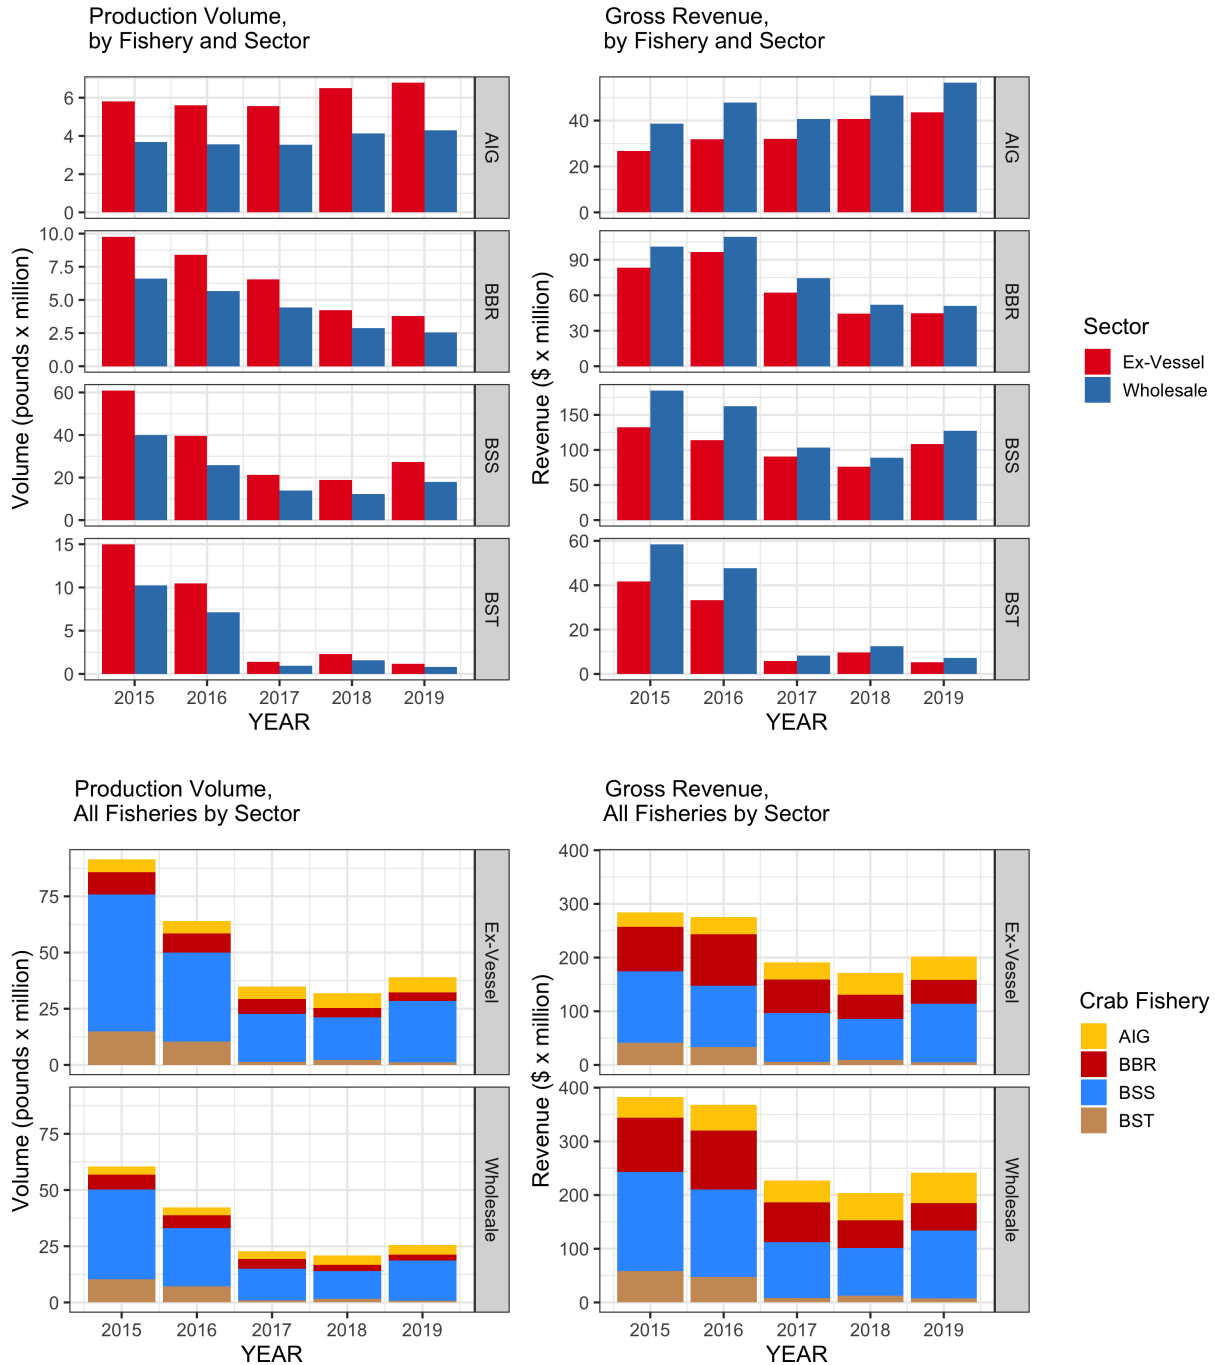

A summary of selected indicators from the most recent employment data available for Crab Rationalization (CR) program fisheries is provided in Table 2 and depicted graphically in Figure 3, reporting results through calendar year 2019.³

During 2019, 91 vessels actively operated in BSAI crab fisheries, a historically low level of vessel participation across all BSAI crab fisheries, while the number of vessels operating in one or more of the CR fisheries in 2019 remained constant at 67. The active fleet in the AIG fishery remained constant at 5, while participation in the BBR fishery increased by one to 56 vessels and declined to the lowest level to-date at 61 in the BSS fishery, and vessels actively fishing in the WBT fishery during declined from 30 to 18. Based on the number of crew onboard participating vessels during each fishery (averaged over crew size values reported in eLandings catch accounting records for crab vessels), there were an estimated 974 crew positions in aggregate across all 67 vessels in CR fisheries in 2019, a 7% decline from the previous year, the lowest number of crew positions reported in CR fisheries to-date.⁴

³BSAI Crab Economic Data Report (EDR) data are collected for CR fisheries only. The NSR and Pribilof Island golden king (PIG) crab fisheries are managed by the State of Alaska under the FMP, but are not included in the CR program.

⁴Note that the aggregate count of vessels indicates the total number of distinct vessels, while the count of crew positions counts positions separately by fishery and vessel, such that individual crew members are counted more than once.

Figure 1: BSAI Crab Ex-vessel and First Wholesale Production, 2015 - 2019

Figure does not display information for NSR, SMB, and PIG fisheries due to confidentiality. See Table 1 footnotes for details. Ex-vessel and First Wholesale Weighted Average Price, 2015 - 2019. See Table 1 footnotes for data sources and details.

Figure 3: Harvest and Processing Employment and Compensation, Selected Crab Fisheries, 2015 - 2019

Source: NMFS AFSC BSAI Crab Economic Data Report (EDR) database; ADF&G Shellfish Observer Program, Confidential Interview Form (CIF) database. See Table 2 footnotes for details.

Across CR fisheries in 2019, revenue-share payments to crab vessel crew members as a group totaled approximately \$27.1 million , with an additional \$11.4 million paid to vessel captains, increasing by 23% and 16% respectively.⁵

Aggregate crew earnings in the AIG fishery during 2019 increased by 24% to \$6.6 million, and captain earnings declined by 3% to \$2.4 million. Aggregate crew earnings in the BSS fishery increased by 43% to \$14.7 million and captain earnings increased by 45% to \$6.4 million, while crew and captain earnings in the BBR fishery each declined slightly, to \$4.9 million and \$2.3 million, respectively. Earnings in the BST fishery also declined substantially, with captain earnings of \$410 thousand reduced by 32%, and aggregate crew earnings falling 35% from 2018 to \$920 thousand.

The number of active processing plants receiving deliveries from BSAI crab fisheries also continued a long declining trend in 2019, falling to just seven, the lowest number in the history of BSAI crab fisheries, and compared to 19 active plants in CR fisheries as of 2006. Crab processing employment in 2019, as measured by hours of processing labor input at plants that received IFQ and CDQ crab landings, is estimated at 452 thousand labor hours, an 18% increase from 2018. Aggregate wages paid to crab processing line employees across all CR fisheries during 2019 generated labor earnings of \$6.2 million, 29% greater than the previous year. Based on number of processing labor hours and wage payments in each CR fishery reported by crab processors, average hourly labor earnings over all CR fisheries increased by 7% to \$12.815 per hour in 2019, reversing declines observed in the previous two years. The BSS fishery accounted for the largest share of processing labor wages in 2019, at \$4.6 million.

IFQ Leasing

This report provides results from the BSAI Crab Rationalization Economic Data Report (EDR) program collection of crab harvest quota allocation lease data associated with 2012 through 2019 calendar year crab fishing activity. Table 3 and Figure 4 shows aggregated results for crab fishing quota lease market indicators over the most recent five calendar years for CR fisheries, by fishing quota type. Quota types are categorized as the following: catcher vessel owner (CVO) Class A IFQ; catcher vessel owner Class B IFQ and catcher/processor owner (CPO) IFQ; catcher vessel crew IFQ and catcher/processor crew IFQ, and Community Development Quota (CDQ). Indicators shown in Figure 4 include weighted average statistics for average lease rates (lease price as percentage of ex-vessel price) per vessel, aggregate volume of quota pounds leased as a percentage of total landings, and aggregate quota lease cost as a percentage of gross ex-vessel revenue. Table 3 also reports volume (in pounds) and cost reported for crab vessels active during fishing year, including total quantities summed over all reporting vessels, and average values (both median and mean) per vessel.

The total volume of leased quota in the BBR fishery during 2019, aggregating over all IFQ and CDQ pounds leased, at 2.94 million pounds, represented 89% of total ex-vessel pounds landed in

⁵ In addition to revenue-share payments, income is derived by some crew and many captains from royalties for harvesting quota shares held by either the captain or crew. While this may become an increasingly important source of income as opportunities for investment in QS ownership are advanced, there is no evidence to date that the proportion of CR fishery quota share pools held by crab crew members has changed in recent years, following a small amount of consolidation occurring during the initial years of the program (see NMFS Alaska Region, Restricted Access Management Program, Bering Sea and Aleutian Islands Crab Rationalization Program Report, Fishing Year 2011/12 for information on quota allocation and transfer activity, and other current CR program administration details).

Figure 4: Crab Harvest Quota Lease Market Indicators, Selected Crab Fisheries, 2015 - 2019

Source: NMFS AFSC BSAI Crab Economic Data Report (EDR) database. See Table 3 footnotes for details.

the fishery, a slight decline from 2018, but relatively high compared to previous seasons when leased quota varied annually between 78% and 84% of annual pounds landed. Similarly, aggregate quota costs in the BBR fishery during 2019 declined slightly to 57%, still substantially greater than the range prior to during 2018 of 51% to 53% of total ex-vessel value. A similar increasing trend in aggregate lease volume relative to total catch is apparent in the BSS fishery, with the volume of

quota leases reported by the 51 vessels landing leased quota (out of 61 vessels active in the fishery) during 2019 increasing in aggregate to 89% of ex-vessel pounds landed, compared to the range of 81% to 84% observed prior to 2017. However, quota lease payments as a proportion of ex-vessel value have only modestly, if consistently increased in the BBR fishery on recent years, from 39% in 2014 to 43% in 2019.

In contrast to more dynamic changes in the volume of lease activity in recent years, quota lease rates (i.e., the per-pound lease cost as a percentage of ex-vessel value) have remained quite stable. The median and weighted average lease rates in the BBR and BSS fisheries shown in Table 3 vary somewhat by quota type within fishery, but are generally quite consistent over the most recent five years. The median lease rate reported for BBR CVO Class A allocation has remained at 62% to 63% of ex-vessel price, and between 63% to 66% as a weighted mean. A lease rate premium of 2-5% is typically reported for CDQ and non-share-matched IFQ types (CVO Class B and Crew IFQ) over the rate received for BBR CVO Class A, and the 68% average rate reported for 2019 for both CDQ, as compared to 63% for CVO Class A IFQ, was consistent with this pattern. The median lease rate for CVO Class A quota in the BSS fishery has remained between 46% and 47% of ex-vessel value, and between 48-49% as a weighted average, and with similar premiums of 3% to 6% received for CDQ and non-share-matched IFQ.

Notes: Data shown for all BSAI crab fisheries by calendar year. All dollar values are adjusted for inflation to 2019-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

^a Except where noted, ex-vessel results reflect total commercial sales volume and value across all management programs (LLP/open access, IFQ, CDQ, ACA), inclusive of all harvesting sector production (CV, CP, and catcher-sellers); ex-vessel average price results are sourced from CV sector EDR data for CR program fisheries and from CFEC gross earnings estimates for non-CR fisheries; ex-vessel value of CP and catcher-seller landings are incorporated in revenue total using average CV ex-vessel price as a proxy per-pound value, multiplied by pounds of live catch

^b Counts of buyers include CPs landing and processing their own crab, but exclude catcher sellers (NSR fishery only); processing sector results are inclusive of all CP and shoreside processor output. CR program fisheries finished volume and gross first wholesale revenue and price for 2015 to current are sourced from calendar year sales reported in crab processor EDR data; production volume for non-CR fisheries is estimated from ex-vessel landings volume adjusted using average product recovery rate (PRR), with price and revenue derived from COAR gross earnings estimates.

^cStatistics reported for “All BSAI Fisheries” reflect information aggregated over all FMP crab fisheries, excluding fishery-level confidential information suppressed where indicated by “*”.

^dLandings and ex-vessel revenue suppressed in years where CDQ fishery landings are confidential.

^eData for Norton Sound red king crab are aggregated over the summer and winter commercial fisheries.

Source: ADF&G fish ticket data; eLandings; CFEC ex-vessel pricing; ADF&G Commercial Operator’s Annual Report (COAR) data; NMFS AFSC BSAI Crab Economic Data Report (EDR) database.

Notes: Data shown for all BSAI crab fisheries by calendar year. All dollar values are adjusted for inflation to 2019-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

^a Crew positions total and median summary statistics are calculated from vessel-level observations derived from eLandings crew size reporting, averaged over all landings in the respective fishery reported by each active vessel.

^b Crew and captain payments reflect amounts paid for labor during the crab fishery and include all post-season adjustments, bonuses, and deductions for shared expenses such as fuel, bait, and food and provisions; payments for IFQ royalties, labor outside of crab fishery, health/retirement or other benefits are excluded.

^c Processing labor hours reflect hours worked by processing-line employees working at shoreside and floating processor sectors only, excluding processing employees on catcher/processors and salaried workers employed in the processing sectors.

^d Pay per hour statistics reflect only the shoreside and floating processing sectors; all other processing labor pay statistics are reported inclusive of catcher/processors

Notes: Other fishery data is not shown due to insufficient observations. Lease data shown represent “market-rate and/or negotiated price” lease transactions as reported for active crab fishing vessels in the 2012 through 2018 Crab EDR, which includes both true arm’s length transactions as well as transfers between related parties at market-rate value. Harvest quota types are categorized in this report as the following: CVO A (catcher vessel owner Class A IFQ), CVO B + CPO (catcher vessel owner Class B IFQ and catcher/processor owner IFQ), and CVC + CPC (catcher vessel crew IFQ and catcher/processor crew IFQ). Statistics reported represent results pooled over all quota types and/or regional designations within each category.

^a Vessels column shows total count of vessel-level observations for fishery-year where both pounds and cost of quota leased were reported as non-zero values; in a small number of observations where leased pounds was reported for a given fishery/quota type but lease cost was missing, the mean price over all complete observations was used to impute the missing data in computing the total aggregate lease cost over all vessels.

^b Average lease price statistics by fishery and quota type are calculated as the median and arithmetic mean, respectively, over all observations where both pounds and cost for one or more quota type within the respective category were reported as non-zero values.

^c Average lease rate statistics by fishery and quota type are calculated as the median and mean, respectively, of the ratio of lease price to ex-vessel price, over all observations where both ex-vessel and lease pounds, and ex-vessel revenue and lease cost, were reported as non-zero values. Lease rate for each quota type is calculated with respect to ex-vessel value of crab sold using the same quota type. As such, variation in lease price and lease rate in a given fishery may not be consistent between different quota types.

1. INTRODUCTION

This report provides statistics on economic activity in commercial crab fisheries managed under the North Pacific Fishery Management Council's *Federal Fishery Management Plan For Bering Sea/Aleutian Islands King and Tanner Crabs* (FMP), with substantial additional detail available for active fisheries managed under the Crab Rationalization Program. The report is produced as part of the annual *Stock Assessment and Fishery Evaluation For The King and Tanner Crab Fisheries Of The Bering Sea and Aleutian Islands Regions* (SAFE), and is provided as a reference source for information on status and trends in social and economic dimensions of fisheries managed under the FMP to support evaluation of management and regulatory decision making.

Across all fisheries managed under the FMP, total volume of commercial ex-vessel landings in 2019 was 39 million pounds, with an estimated gross ex-vessel revenue value of \$202 million. Total sales of finished crab production reported by processors in 2019 across all FMP crab species and product forms was 25.5 million pounds, with an estimated first wholesale value of \$242 million (F.O.B Alaska). As an indicator of the relative economic importance of Alaska crab fisheries to the state and U.S. economies, the 63.1 million pounds (28.6 thousand metric tons) of commercial catch of king and tanner crab in domestic waters off Alaska (including catch in the Gulf of Alaska and other crab fisheries not managed under the FMP) during 2016 represented 0.66% of the 9.62 billion pounds (4.62 million metric tons) total volume of U.S. commercial seafood landings, but accounted for 4.83% of total ex-vessel value; with respect to Alaska alone, these fisheries accounted for 1.13% of total landed volume and 16.7 percent of total ex-vessel value produced in commercial fisheries off Alaska (NMFS, 2017).

The North Pacific Fishery Management Council (Council) has identified maximizing the social and economic benefits to the nation over time as one of seven management objectives in the FMP, which include, but are not limited to:

“profits, income, employment, benefits to consumers, and less tangible or less quantifiable social benefits such as the economic stability of coastal communities” (NPFMC, 2011; pp. 28-29).

The Council further stipulated that, in the selection of management measures, specific examination of socioeconomic metrics will include: the value of crab harvested (less deadloss), both during the season for which measures are considered, as well in the future based on value as reproductive as well as harvestable stock; subsistence harvests; and economic impacts on coastal communities,

“... accomplished by considering, to the extent that data allow, the impact of management alternatives on the size of the catch during the current and future seasons and their associated prices, harvesting costs, processing costs, employment, the distribution of benefits among members of the harvesting, processing and consumer communities, management costs, and other factors affecting the ability to maximize the economic and social benefits as defined in this section.”

The information presented in this report is provided as an annual summary of the economic status of the BSAI crab fisheries in terms of the magnitude and distribution of benefits produced by the fisheries, as broadly outlined in the FMP, in the context of the most recent period for which data are available and the flow of benefits as produced over time. The report is not intended to provide a dedicated analysis of any specific management measure, either prospectively or retrospectively, but is expected to facilitate greater access to social and economic indices of fishery performance, support preparation and use of such information in more targeted analyses, and over time, develop improved social and economic metrics for effective monitoring and evaluation of management goals and objectives. The report consolidates relevant information published in annual management reports by Alaska Department of Fish and Game and NOAA Fisheries Alaska Region, supplemented with additional analysis and information derived from primary data collected annually by the State of Alaska's Commercial Fisheries Entry Commission, NOAA Fisheries Alaska Fisheries Science Center, and Pacific States Marine Fisheries Commission.

Chapter 2 of this report presents summary statistics and discussion of social and economic status and trends in commercial fisheries encompassed under the following categories: i) economic output; ii) income and employment; iii) harvest sector operating costs and net income; iv) use and distribution of ownership in quota share allocations and other fishery capital assets; v) fishing and processing capacity and effort, and vi) international trade in crab commodities. Within each of these categories, current status is represented in terms of annual averages and totals for the most recent five to seven years of data available. In most cases, the most recent period for which data are presented is two calendar years prior to the date of publication, or the crab fishery season prior to the current season as of the date of publication. All monetary values are inflation-adjusted to 2019-equivalent U.S. dollar terms using the GDP chain-type index (BEA; <https://fred.stlouisfed.org/series/GDPCTPI>). See below for additional introductory notes regarding data sources and reporting conventions used in this document.

1.1. Fishery Overview

Ten crab stocks are currently managed under the BSAI crab FMP: four red king crab (*Paralithodes camtschaticus*) stocks: Bristol Bay, Pribilof Islands, Norton Sound, and Adak (Western Aleutians); two blue king crab (*Paralithodes platypus*) stocks: Pribilof District and St. Matthew Island; two golden (or brown) king crab (*Lithodes aequispinus*) stocks: Aleutian Island and Pribilof Islands; Bering Sea Tanner crab (*Chionoecetes bairdi*), and Bering Sea snow crab (*Chionoecetes opilio*). These ten crab stocks are targeted in eleven fisheries, managed by NOAA Fisheries and the State of Alaska (SOA) as distinct units: Bristol Bay red king crab, Bering Sea snow crab, Eastern Aleutian Islands golden king crab, Western Aleutian Islands golden king crab, Norton Sound red king crab, Pribilof Islands golden king crab, St. Matthew Island blue king crab, Adak red king crab, separate fisheries for the Eastern- and Western- components of the Bering Sea Tanner stock, and a single combined fishery for Pribilof Islands red and blue king crab Eastern.

Management of these stocks is shared between NMFS and SOA under terms set forth in the FMP, which defines management measures within three categories:

1. Those that are fixed in the FMP and require FMP amendment to change;
2. Those that are framework-type measures that the state can change following criteria set out in the FMP; and

3. Those measures that are neither rigidly specified nor frameworked in the FMP.

Under the shared state and federal management structure specified in the FMP, decisions regarding management of crab stocks that are reserved to the Council and NMFS under the FMP Annual OFL and ACL status determinations are made by NMFS with Council input subject to federal requirements under the Magnuson-Stevens Reauthorization Act; as the findings of scientific assessments, stock status determinations and not in themselves considered to be management decisions.

Amendments to the FMP itself (Category 1 measures) pertain to changes in the federal regulatory framework under which the crab fisheries are managed, and are thus reserved to the Council and NMFS. Such changes typically involve measures of sufficient scope that they require federal rulemaking and call for preparation of dedicated socioeconomic analyses of decision alternatives, typically in the form of a combined Environmental Impact Statement or Environmental Assessment, Regulatory Impact Review, and Initial Regulatory Flexibility Analysis (EIS or EA/RIR/IRFA; e.g. NMFS, 2004). Category 2 and 3 measures are deferred to the State subject to terms of the FMP. Annual OFL and ACL stock status determinations are approved by the Council and NMFS Alaska Regional Office under the FMP in conformance with the Magnuson Stevens Act. As the findings of scientific assessments, status determinations and not in themselves considered to be management decisions. Although these determinations set the upper bound on total catch of FMP crab stocks, including both directed fishing and bycatch in other fisheries, decisions with respect to annual Total Allowable Catch (TAC) and GHL (Guideline Harvest Level) levels for directed fishing are designated Category 2 measures deferred in the FMP to the state. TACs are set for crab fisheries managed under the Crab Rationalization Program, described in further detail below, while GHLs are set by the state for the Pribilof Islands golden king crab and Norton Sound red king crab fisheries.

Of the 10 crab stocks and 11 fisheries managed under the FMP, seven fisheries were open to targeted fishing during 2019 and 2020, including the Bristol Bay and Norton Sound red king crab fisheries, Eastern and Western Aleutian Islands and Pribilof Islands golden king crab fisheries, the Bering Sea snow crab fishery, and Western Bering Sea Tanner crab fisheries.¹ The latter has been closed for the 2019/20 season; after closure for the 2010/11 through 2012/13 seasons, the Bering Sea Tanner crab fisheries opened for targeted fishing for 2013/14 through 2015/16 seasons, but under ADF&G management strategy, were subsequently closed for the 2016/17 season; the Western Bering Sea Tanner (WBT) crab fishery opened for the 2017/18 and 2018/19 seasons, but neither of the Eastern or Western Bering Sea Tanner fisheries were opened for the 2019/20 season.

The Saint Matthew blue king crab fishery was declared to be overfished in October, 2018 and a rebuilding plan for the fishery is currently in development. This follows a history of intermittent open seasons in the fishery. After closure for ten years while under a rebuilding plan beginning in 1999, the Saint Matthew Island blue king crab stock was declared rebuilt in 2009 and the fishery was opened for the 2009/10 season. Due to low area-swept survey results in 2013, the fishery was closed for the 2013/14 season, but was subsequently reopened for the 2014/15 and 2015/16 seasons; with low survey abundance again in 2016 through 2018, the fishery has been closed for the 2016/17, 2017/18, and 2018/19 seasons. The Pribilof Islands blue king crab stock was declared overfished in 2002 and the combined red and blue king crab fishery has been closed to directed fishing to date.

¹As detailed in the 2012 SAFE summary chapter and Bering Sea Tanner crab assessment chapter and appendices, the CPT has analyzed, and the Council subsequently approved, a revised baseline period for determination of the current recruitment potential of the stock, resulting in a determination that the stock had not been in an overfished condition in 2010 or subsequently. Despite the EBT stock status determination for 2012/13 as not overfished, the SOA did not open the fishery for 2012/13, but the fishery was reopened for the following 2013/14 season.

The Council took final action in June, 2012, approving Amendment 103 to the FMP for Groundfish of the BSAI, prohibiting directed fishing for Pacific cod with pot gear within the Pribilof Islands Habitat Conservation Zone (already closed to all trawl fishing under the FMP), and Amendment 43 to the FMP for BSAI King and Tanner Crabs revising the rebuilding plan to acknowledge that the time required to rebuild the stock would likely exceed 10 years despite available management measures. The rule implementing the amendments became effective January 1, 2015 (79 FR 71344).

To date, there has been no stock survey for Western Aleutian (Adak) red king crab and therefore no basis for stock status determinations, and the fishery has been closed since 2003/2004.

1.1.1 BSAI Crab Rationalization Program

In March 2005, NMFS issued a final rule to implement the Crab Rationalization (CR) Program as Amendments 18 and 19 to the BSAI Crab FMP. The CR Program went into effect with the 2005/2006 crab season that began in August 2005, which affects the following fisheries: Bristol Bay red king crab (BBR), Bering Sea snow crab (BSS), Eastern Bering Sea Tanner crab (EBT), Western Bering Sea Tanner crab (WBT), Pribilof blue and red king crab (PIK), St. Matthew Island blue king crab (SMB), Western Aleutian Islands golden king crab (WAG), Eastern Aleutian Islands golden king crab (EAG), and Western Aleutian Islands (Adak) red king crab (WAI). Two fisheries managed under the BSAI crab FMP, Norton Sound red king crab (NSR) and Pribilof Islands golden king crab (PIG), are excluded from the CR Program.

The CR Program allocates BSAI crab resources to qualifying harvesters, vessel crew members, processors, and Western Alaska coastal communities. Under terms of FMP Amendments 18 and 19 and subsequent amendments, harvest and processing privileges in the CR fisheries are granted as long-term percentage shares, designated as harvest quota share (QS) and processor quota share (PQS). Subject to annual application requirements, annual allocations proportional to QS and PQS percentages are issued to participating share holders as Individual Fishing Quota (IFQ) and Individual Processing Quota (IPQ) permits, granting pound-denominated quantities of catch and processing shares of the annual Total Allowable Catch (TAC). The harvest component of the CR fisheries is divided between the QS/IFQ component, representing 90% of the annual TAC, and the remaining 10% allocated as Community Development Quota (CDQ) or, for Western Aleutian Islands golden king crab fishery, Adak Community Allocation (ACA) quota. Under the three-pie allocation system that is unique to the CR Program, a portion of the harvest shares issued as IFQ are subject to a share matching requirement, wherein subject IFQ must be sold to qualified crab buyers holding shares of IPQ, with additional delivery requirements designating a portion of share-matched IFQ for delivery to specified regions within the BSAI. Specifically, IFQ allocations issued to catcher vessel owners (CVO-IFQ) are issued as 90 % Class A IFQ, subject to regional delivery requirements and share-matching, and the remaining 10% designated Class B IFQ are exempt from share matching and regional delivery requirements. All other QS/IFQ pools, including those issued to catcher/processor owners, catcher/processor crew members, and catcher vessel crew members, as well as CDQ and ACA allocations, are exempt from regional delivery and share matching requirements.

In this report the terms “BSAI crab” and “FMP crab” are interchangeably used to denote the collective commercial crab fisheries associated with the ten crab stocks currently managed under the BSAI crab FMP, and “CR crab” to denote those fisheries included in the CR program, inclusive of all QS/PQS, CDQ, and ACA allocations; and the term “IFQ fisheries” to denote specifically the

QS/IFQ and PQS/IPQ allocation fisheries within the program. All other crab stocks in waters off Alaska are exclusively managed by the State and are outside the scope of this report.

This overview outlines the key details regarding the structure of BSAI crab management and the CR program as referenced in this report. For detailed information regarding the regulatory structure of BSAI crab fisheries and recent management actions, readers are referred to the FMP, NMFS Alaska Region's Annual Bering Sea and Aleutian Islands Crab Rationalization Program webpage, and the Council's Crab Rationalization webpage (website address URL's and links to other useful references regarding the CR Program are provided below). The Council completed its 10 Year Review of the CR Program during 2016, and readers are directed to the review for a comprehensive analysis of the performance of the CR program over the 2005 to 2014 period (NPFMC, 2017). Several elements of annual CR program administration of importance to economic status of the fisheries are publicly reported on the NMFS AKR CR program webpage, including annual reports of QS/PQS entity holdings and IFQ/IPQ annual allocations; harvest cooperative formation, membership, and IFQ assignment by fishery; initiation and outcomes of arbitration proceedings between harvesters and processors; safety and regulatory compliance by program participants; loan issuance under the NMFS Fisheries Finance Program; and CRP cost recovery fee assessment and collection.

Additional information on BSAI crab fisheries is available from NOAA Fisheries Alaska Regional Office (AKR), the North Pacific Fishery Management Council (NPFMC), and the Alaska Department of Fish & Game (ADF&G). 1.2. Data Sources

The current report summarizes information available to date, largely comprising data reported through 2020 for the 2019 calendar year, spanning the end of the 2018/19 and beginning of the 2019/20 crab seasons. All data sources are subject to revision as data errors at the observation level are identified and corrected. Data for the most recent period available for all sources, but particularly from BSAI Crab Economic Data Report (EDR) data, is presented on a preliminary basis and may change significantly in the next annual release of the report, or in an amended version of the current report.

This document is the primary channel for publication of aggregate data from the Crab EDR program administered by NMFS Alaska Fisheries Science Center, Economic and Social Sciences Research Program (AFSC, ESSRP). The EDR program is a mandatory census involving reporting of detailed operational and financial information by owners and leaseholders of vessels and processing plants participating in CR program fisheries. The EDR program was designed by the Council as a component of the Crab Rationalization Program to improve its ability to monitor and assess achievement of social and economic objectives of management set forth in the FMP. Broadly speaking, the objectives of this reporting requirement are to monitor the economic performance of the rationalization program in terms of changes in the efficiency and profitability of the fisheries, and economic stability for harvesters, processors, and coastal communities, as a result of the rationalization of the fisheries and in response to ongoing management decisions. The EDR reporting requirement was implemented in 2005, with baseline data submission required retroactively for 1998, 2001, and 2004, and subsequently, on an annual basis, for calendar year crab fishing and processing activities for 2005 to present. Revised EDR reporting requirements implemented under Amendment 42 (78 FR 36122, June 17, 2013) to the FMP went into effect during 2013 for 2012 and subsequent calendar year data.

The current Economic Status Report focuses on reporting summary statistics for reported values across EDR data elements identified as sufficiently accurate for public reporting. Several key elements in the EDR data collection prior to 2012 were limited by data quality have not been used in analysis of the CR program (AFSC, 2011) and have been withheld from the current report. These include quantity and cost of fuel used in the fishery, prices and costs for leasing of Individual Fishing Quota (IFQ), and spending for factor inputs by individual location. Given the importance of these elements in examining changes in profitability and distribution of income generated by and within the fishery, these data quality issues have limited the analysis of several key performance metrics for the fishery. Revised data collection protocols implemented for 2012 and subsequent reporting years have corrected errors associated with quantity and cost of fuel and prices and costs for leasing of crab fishing quota, and data reported for 2012 forward are presented in the current report; data reported previous to 2012 continue to be withheld due to data quality limitations. Several data elements were eliminated under revised EDR protocols, most notably all operating and capital cost elements for the crab fishing vessel and processing sectors, with the exception of fishing crew wages, processing labor wages, aggregate salary expenses, lease expenses for fishing quota (IFQ and CDQ/ACA quota) and processing quota (IPQ), vessel expenses for fuel, bait, and food and provisions, and payments for custom processing of crab purchased but not processed by the buyer submitting the EDR.

Varying degrees of coverage error apply to EDR data collected retroactively in 2005 for calendar years 1998, 2001, and 2004, as well as for certain processing-sector reporting elements in all years of the data collection. The historical (pre-2005) reporting requirement was tied to issuance of fishing

and processing quota in the rationalized fishery. As such, the historical data may exclude operations that participated in the crab fisheries in 1998, 2001, and/or 2004 but did not anticipate receiving quota in the rationalized fishery. Additionally, because purchasers of CR crab that do not process any crab in their own facility are exempt from EDR reporting requirements, the data collection does not represent a full census of activity, revenue, and costs in the processing sector.

A number of other sources in addition to the EDR database have been utilized to compile the statistics presented in this report. ADF&G fish tickets document commercial harvest from Alaska commercial fishery resources, including all BSAI crab fisheries. Since implementation of the crab rationalization program in 2005/06, NMFS Alaska Region, Restricted Access Management (RAM) division has maintained accounting of landings, quota usage, and quota disposition in the IFQ crab fisheries. The ADF&G Commercial Operator's Annual Report (COAR) provides data on statewide crab production differentiated by crab species, product, and process type; and is additionally used by the Alaska Commercial Fisheries Entry Commission (CFEC) to estimate crab ex-vessel pricing. Regular reporting on BSAI crab fisheries cited in this document include the *Bering Sea and Aleutian Islands Crab Rationalization Program Report*, published annually (through the 2011/2012 crab seasons) by NMFS Alaska Region, RAM Division; and area management reports published by ADF&G.²

The Program Report provides information on the annual management of the CR program fisheries, and particularly the IFQ fishery component of the program. ADF&G fishery management reports provide information on fishery history, management, and stock status, in addition to detailed information on fishing activity occurring in the most recent fishing season. Citations for these and other sources used in compiling this report are provided in figure and table footnotes and in the References section.

1.3. Data Conventions

Under the Magnuson-Stevens Fishery Conservation and Management Reauthorization Act (P.L. 109-479), fishery information required to be submitted under Fishery Management Plans, including landings data, is confidential. NOAA Administrative Order (NAO) 216-100 is the principal guidance for NOAA Fisheries employees on protocols for handling confidential data. To assure confidentiality, data must be structured or aggregated so that the identity of the submitter cannot be determined from the present release of the data or in combination with other releases. "Submitter" is applied in context for the specific data presented. Data provided by the State of Alaska are treated consistent with the Memorandum of Understanding between NMFS and the State of Alaska regarding data sharing. Due to the sensitive nature of financial information reported in this document, confidentiality protocols have been interpreted conservatively and may result in greater suppression of statistical information representing contributions from low numbers of reporting units. Data cited in this report have been aggregated across individual reporting entities by year and management unit so as

²With the exception of Norton Sound red king crab, all fisheries included in the BSAI crab FMP are managed as part of the ADF&G Westward Region, Bering Sea/Aleutian Islands Management Area, with annual reporting on these fisheries available in the *Annual Management Report for the Commercial and Subsistence Shellfish Fisheries of the Aleutian Islands, Bering Sea and the Westward Region's Shellfish Observer Program* (<http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyareaaleutianislands.shellfish#/management>). Norton Sound red king crab is managed as part of the Norton Sound and Kotzebue Management Area within the Artic-Yukon-Kuskokwim Region; reporting is provided in *Annual Management Report Norton Sound, Port Clarence, and Kotzebue* (<http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyareanortonsound.shellfish>)

to satisfy confidentiality requirements, while maximizing detail and comparability of statistics both within and among tables and figures.

All price, revenue, and other monetary values in the report, unless otherwise noted. The Gross Domestic Production (GDP) chain-type price index (<https://research.stlouisfed.org/fred2/series/GDPCTPI>) accounts for change in the general price level of US domestic production of all goods and services, and is used in this report to deflate estimates of production revenues and costs reported for the crab processing sector, and with some exceptions, for costs and revenues in the harvest sector. Where noted, the Personal Consumption Expenditures (PCE) chain-type price index (<https://fred.stlouisfed.org/series/PCEPI>) is used to deflate estimates of income accruing to vessel owners and crew in the harvest sector. GDP and CPI Index values from 1991 to 2019 are provided in Table 3.50 of Section 3.³

Some notable discontinuities and other limitations in source data limit comparability of statistics between tables or in time series within some tables. In particular, discontinuation or revision of several capital and operating expenditure data elements are reflected in the current report, with data series for the affected data elements terminating at 2011 or beginning at 2012. To replace data previously provided by EDR reporting of days active in crab fisheries in the EDR (days fishing, days steaming and offloading, and days processing; discontinued for 2012 and subsequent years), data collected by ADF&G is incorporated in the current report. However, as the replacement data set (Confidential Interview Form (CIF) data) is only available beginning 2008, all statistics presented on a daily pro-rata basis in the report use CIF data where available, and EDR data otherwise. The calendar-year basis by which most statistics in this report are presented is incongruent with the July-to-June management season of BSAI crab fisheries, resulting in some statistics presented on a fishery-year basis where disaggregation to the calendar-year is infeasible with available data. Declining participation in CR program fisheries following rationalization has reduced the number of reporting entities in some strata below minimum thresholds for nondisclosure, necessitating aggregation across strata in order to maximize use and dissemination of available data. EDR data for the Eastern and Western Aleutian Islands golden king crab fisheries are reported together in aggregate, even though the fisheries are prosecuted by partially distinct fleets and managed as distinct fisheries. Users should also note the discontinuity in presentation of EDR statistics by industry sector between 2009 and earlier years: due to low participation in the catcher/processor sector, EDR data from 2009 forward are presented with aggregations over the catcher/processor and catcher vessel sectors for statistics related to harvesting activity; and over the catcher/processor, shoreside processor, and floating processor sectors for statistics related to processing activity. Users should also note that the validation process for EDR data and finalization of the dataset may take several months following the EDR submission deadline, and statistical values for the most recent period published in the report may be subject to revision in the next annual edition.

Users of this report are strongly encouraged to consult table and figure footnotes, which provide citations of data sources, interpretive guidance, and discussion of data limitations and qualifications in addition to those already noted above and/or in discussion text accompanying figures and tables. Figures for selected results are accompanied by cross-references to the relevant tabular data; more extensive footnotes are provided with tabular data in order to conserve space. Users should also

³Previous editions of the report used U.S. Bureau of Labor Statistics Producer Price Index for unprocessed and packaged fish to adjust for inflation, but for consistency with the Groundfish Economic SAFE document, this and subsequent editions of the report use the GDP deflator.

note the abbreviation and notation conventions used in tabular and graphical presentations of data in this report:

Abbreviations and notations used in tables and figures

*	Data suppressed to prevent disclosure of confidential information
n/a or -	Not applicable
-	No data available (data not collected, no observations in reported data, or available data are insufficient for public reporting).
2005 or 05	Calendar year, or FMP crab fishing season that occurred wholly within calendar year
2005/06 or 05/06	FMP crab fishing year
lbs.	Pounds
mt or <i>t</i>	Metric tons
obs or observations for measure of interest	Number of observations with value > 0
sd	Standard deviation
\$	US dollars; inflation-adjusted to 2019-equivalent value
(blank)	Statistic not calculated; in some tables, certain statistics (e.g. mean or median) are calculated only for a subset of categories or strata, such that columns or rows in a portion of the table are left blank.

2. ECONOMIC STATUS AND TRENDS IN BSAI CRAB FISHERIES

The following section presents information on the economic status of BSAI crab commercial fisheries in terms of economic output, income, and employment; operating and production costs; use and distribution of ownership in quota share allocations and other fishery capital assets; fishing and processing capacity and effort; and international trade in crab commodities. Data are summarized as aggregate totals and/or averages calculated over relevant economic units, primarily at the level of harvesting and processing sectors within individual crab fisheries, with mean and/or median values representing the average value across individual vessels and processing facilities within the respective sector with additional levels of stratification as appropriate, and/or aggregated over some or all crab fisheries. The presentation is largely limited to these descriptive statistics, with measures of variability and/or uncertainty for selected variables where supported by available data. Depending on the data source, results are reported by calendar year (denoted as a single year; for example, 2016), or crab fishery year (spanning July-June and denoted, for example, as 2015/16). The current report summarizes information available in primary databases to date, largely comprising data reported through 2020 for the 2019 calendar year and the early (August - December) portion of the 2019/20 crab season.

As many of the key data sources are reported on an annual basis, current status and trends are framed in the context of inter-annual variation, with a focus on the most recent five to seven years of the crab fishery, with longer time series presented where available and longer historical perspectives noted where relevant, particularly with regard to pre- and post-rationalization comparisons. To the extent that descriptive statistics indicate a sustained directional change in magnitude or distribution of economic benefits, discussion of potential trends and associated management and/or market changes is limited to qualitative description of observed changes over time. Statistical tests to assess significant differences in measured values of the descriptive statistics or attribute causality to management or market factors, or models to forecast changes in status of the fisheries in the future, are not employed in the presentation. In future iterations of this report, as data and methods are developed, the authors intend to incorporate improved analytical methods to enable greater synthesis of recent changes in socioeconomic conditions in the fishery and forecasting to anticipate potential changes in the near- to mid-term future.

2.1. Economic Output

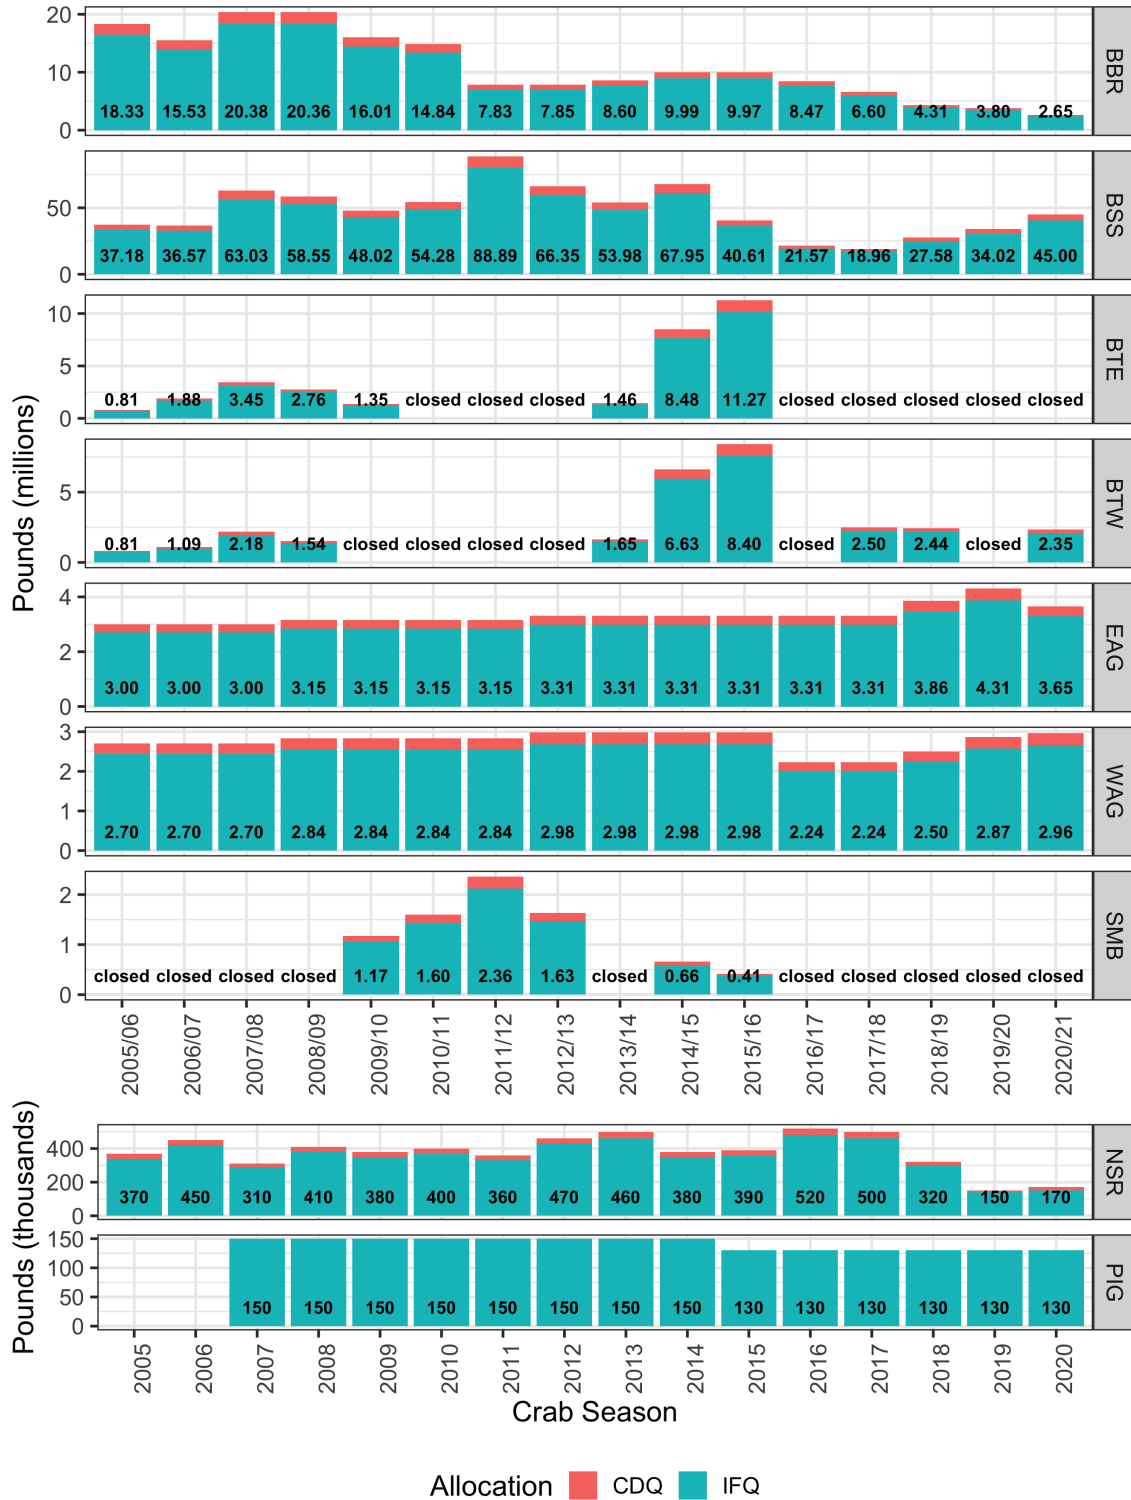

2.1.1 Annual TAC/GHL, Landings, and Finished Product Volume

Crab season Total Allowable Catch (TAC) and Guideline Harvest Limit (GHL) levels are reported by crab fishery in Table 3.1 and summarized graphically in Figure 2.1, including TACs issued for 2019/20 and 2020/21. TACs in the BSS fishery have trended successively upward over the most recent three seasons from a low of 18.96 million pounds in 2017/18, to 45 million pounds in 2020/21. TACs in both EAG and WAG fisheries intermittently saw small incremental increases up through the 2015/16 season, reaching 3.31 million pounds in the EAG fishery and 2.98 million pounds in the WAG fishery. The latter was reduced to 2.24 million pounds for the 2016/17 season, and has incrementally increased over successive seasons, to 2.96 million pounds for the 2020/21 season, while

the TAC in the EAG fishery peaked at 4.31 million pounds for the 2019/20 season, reduced to 3.65 million pounds for 2020/21. TACs in the BBR fishery have declined steadily over the last six seasons, with the 2.65 million pounds issued for 2020/21 representing the lowest TAC since the closure of the fishery in 1995/96. The GHL issued for the combined NSR winter and summer fisheries during 2019 and 2020, 150 thousand and 170 thousand pounds, respectively, are historically low for the stock. Reductions in the BTW fishery TAC in 2017/18 and 2018/19 were followed in 2019/20 with closure of the fishery under ADF&G's harvest management strategy, reopened for 2020/21 with a TAC of 2.35 million pounds. As a result of 2016 and subsequent stock assessments, fishery closures in the EBT and SMB fisheries continued through 2020/21, as did those in other crab fisheries that have remained closed since rationalization.

Since the 2014/15 crab season, allowable catch quantities in all BSAI crab fisheries currently open to targeted fishing are fully exploited (i.e., 98-100 percent of total allocation landed), including the WBT and NSR fisheries, which varied below 50% during some seasons (Table 3.1). Since the 2010/11 crab season, all FMP crab fisheries that were in development following periods of extended closures (including both BST fisheries and the SMB fishery) maintained greater than 75% exploitation of allowable catch during open seasons.

Figure 2.1: TACs/GHLs and Management Program Allocations, BSAI Crab Fisheries

Source: ADF&G. Tabular data available in Table 3.1.

Numeric values above bars indicate total quantity (in million pounds) of TAC/GHL allocations to directed fishing, 10% of which is allocated to CDQ/Adak Community Allocation.

Across all fisheries managed under the BSAI Crab FMP, the total volume of commercial ex-vessel landings during 2019 was 38.99 million pounds (17.69 thousand metric tons), low relative to production over the last two decades, but representing a 22% increase from the historical low production level of 31.87 million pounds (14.45 thousand metric tons) reached in 2018 (Figure 2.2). The increase in aggregate production during 2019 reflected increases across two of the three largest crab fisheries compared to 2018. The total catch of 27.2 million pounds (12.4 thousand mt) landed in the Bering Sea snow crab (BSS) fishery was an increase of 45% from 21.3 million pounds in 2018, which was a historical low for the fishery, and the 6.8 million pounds (3.0 thousand mt) landed in the Aleutian Islands golden king crab (AIG) fisheries during 2019 was a modest 4% increase from 2018 production. Landings in the Bristol Bay red king crab (BBR) fishery declined 11% to 3.8 million pounds (1.7 thousand mt), and landings in the western portion of the Bering Sea Tanner (BST) fisheries during 2019 declined 48% relative to 2018 levels, to 1.2 million pounds (0.54 thousand mt), reflecting closure of the fishery during the 2019/20 season as well as a modest reduction in the 2018/19 BTW TAC compared to the prior season.

Crab processors produced 25.5 million pounds (11.6 thousand mt) of finished crab product volume in 2019, aggregated over all active crab fisheries, a 22% increase in processing sector output from 2018, which was also the lowest historical level of production for the sector. Similar to ex-vessel production, the 22% increase in processing sector output volume aggregated over all active crab fisheries was driven in the largest part by increased production in the BSS fishery during 2019, with finished volume of 17.9 million pounds (8.1 thousand mt) increasing 45% over the previous year, as well as a 4% increase in finished volume in the AIG fishery to 4.3 million pounds (1.95 thousand mt), together offsetting finished output declines of 11% and 48% in the BBR and BST fisheries, to 2.6 million pounds (1.2 thousand mt) and 1.2 million pounds (0.54 thousand mt), respectively.

Figures 2.2 and 2.3 summarize 1998 to 2019 annual (calendar year) values for total landed live catch and gross ex-vessel revenue (detailed in Tables 3.4 to 3.6). Finished production volume and first wholesale value are reported in Tables 3.7 to 3.9 for all crab fisheries managed under the BSAI crab FMP. Figure 2.3 displays production and revenue time series in separate vertical bar graphs for each fishery (note that the vertical scales vary by fishery). To enable clearer comparison of the relative contribution of individual fisheries over time (graphed separately for harvesting and processing sectors), Figure 2.2 displays values of revenue and volume, respectively, aggregated over all crab fisheries and color coded by fishery in proportional area of vertical bars.

2.1.2 Ex-vessel and First Wholesale Prices and Revenue Value of Production

The effect of mixed trends in physical output across BSAI crab fisheries due to changing allowable catch levels and fishery closures, combined with market-driven price changes for crab product, produced an overall 18% increase in both gross ex-vessel and first-wholesale revenue during 2019, to \$202 million and \$242.7 million, respectively (Figure 2.2 and Tables 3.4 and 3.7). The relative revenue gain follows substantial reductions in annual revenue in both sectors during the previous two years, and the three years ending in 2019 represents the lowest period for gross revenues in both sectors since 2006.

With respect to aggregate revenues accruing to active participants within the harvesting and processing sectors, increases in ex-vessel and first wholesale prices in the BBR and BST fisheries partially offset the effect of production declines on aggregate value, while both prices and volume increased in both sectors of the AIG fisheries, and prices declined moderately in the BSS

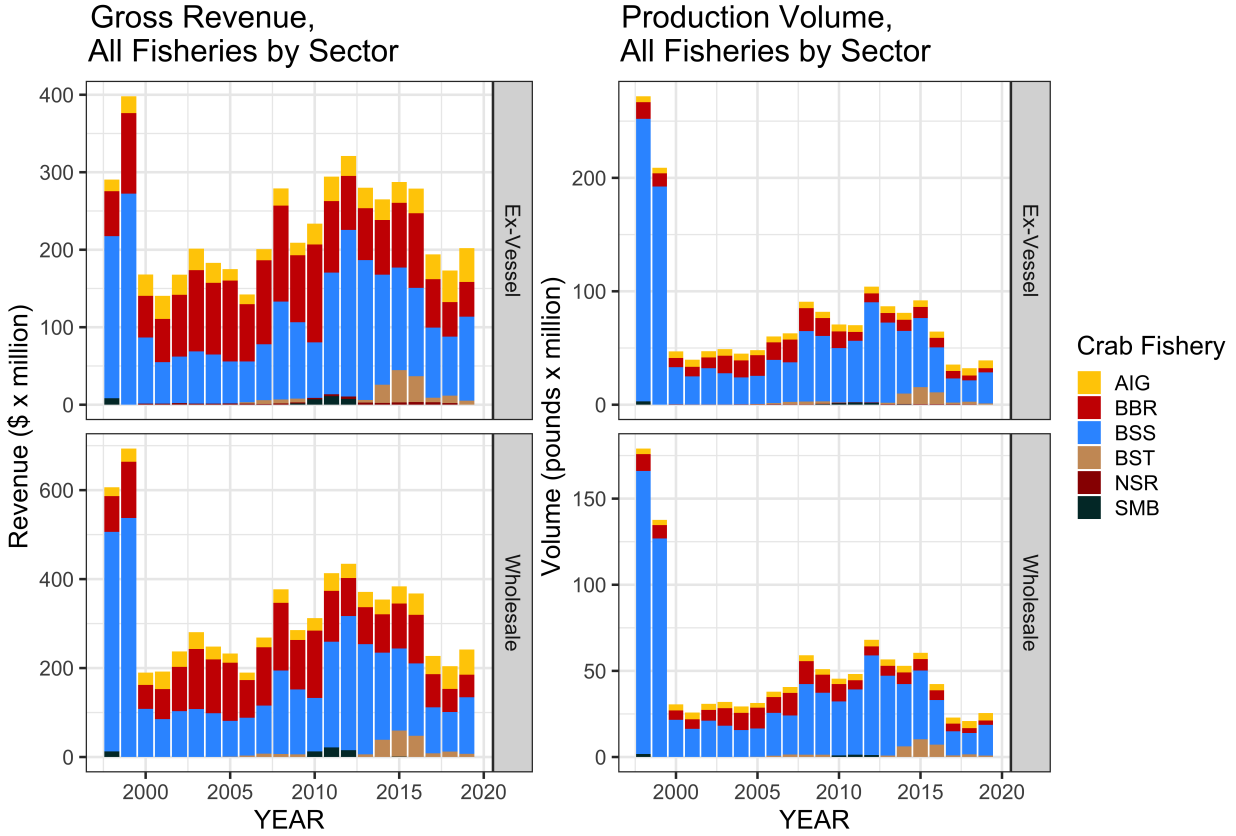

fishery. The average BBR ex-vessel price increased 13% in 2019 to \$11.87 per pound, and the first wholesale price increased 10% to \$19.96 per finished pound. The average first wholesale price in the AIG fishery increased 6% to \$13.12 per pound, while ex-vessel price increased by 2.6% to \$6.42 per pound landed. Both ex-vessel and first wholesale prices in the BST fishery increased 6.5% from 2018, to \$4.48 ex-vessel and \$9.02 at first wholesale. BSS prices declined by less than 2% in 2019, to \$3.98 average ex-vessel, and \$7.12 average first wholesale.

In terms of gross production value, increased production in both sectors of the BSS fishery during 2019 offset the modest decline in prices, producing gross revenue in the harvest sector of \$108 million and \$127 million in the processing sector, up 42% and 43% from the previous year. Ex-vessel revenues in the AIG fisheries increased 7% from 2018, to \$44 million, and by 11% in the processing sector, to \$57 million. Gross ex-vessel earnings in the BBR fishery during 2019 increased slightly (+0.6%) to \$44.8 million, while first wholesale value declined by 2% to \$50.8 million. Gross production value in both sectors of the BST fishery declined substantially during 2019, with \$5.3 million ex-vessel and \$7.3 million in the processing sector declining by 45% and 41%, respectively.

Results for ex-vessel sale volume, value, and prices reported in Tables 3.5 through 3.6 provide additional detail on regional distribution of ex-vessel earnings in terms of vessel owner state-of-residence, between crab vessel size classes, and between crab harvest quota categories. Additional details for statewide (including both FMP crab fisheries and those in Alaska state waters) processing sector sale volume, value, and prices are reported in Table 3.8, and sales by crab species and product type in Table 3.9.

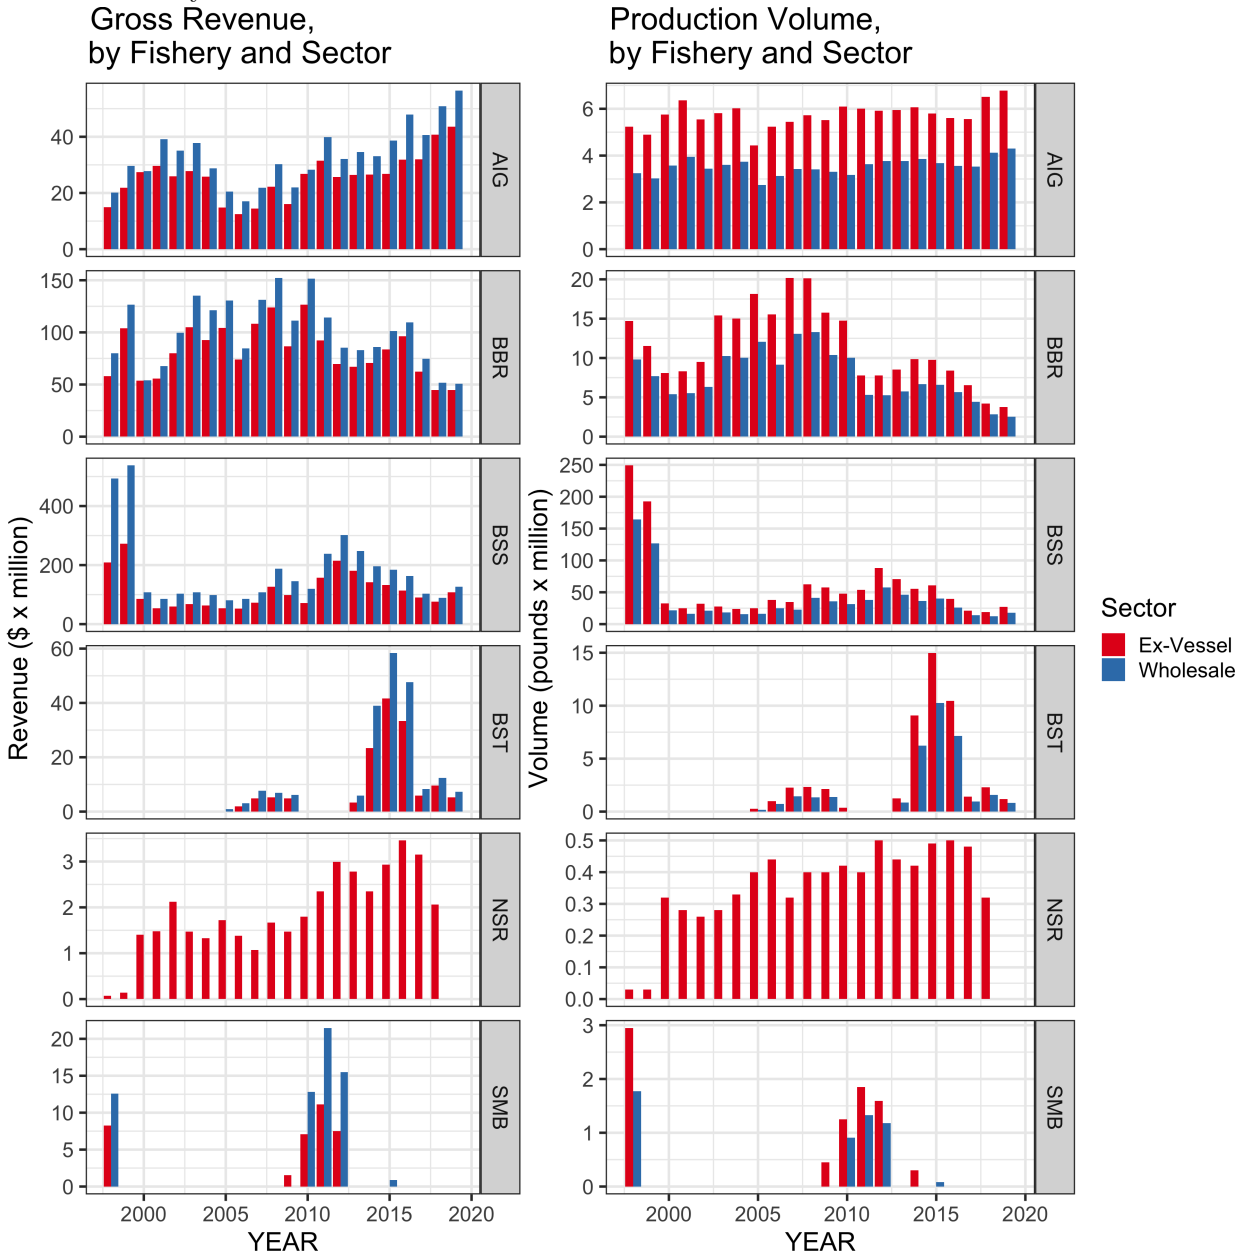

Regional and community-level effects of the distribution of crab vessel ownership and fishery earnings are important concerns, and are influenced by the incentive established under rationalized management. This report provides limited detail on spatial distribution of crab resources and benefits at the regional level. The forthcoming *Annual Community Engagement and Participation Overview (ACEPO)* from Alaska Fisheries Science Center is intended to provide a more comprehensive analysis of community-level distributional aspects of groundfish and crab fishery management, including income and employment effects, and ownership of crab harvest and processing quota assets and vessels. This report is being developed to accompany the annual Groundfish and Crab Economic SAFE documents and will be initially released in 2021.

Figure 2.2: Ex-Vessel and First Wholesale Gross Revenue and Production Volume, by Calendar Year, FMP Crab Fisheries

Source: ADF&G fish tickets, eLandings, CFEC pricing based on COAR buying reports. Data shown by calendar year. Tabular results are shown in Tables 3.4 and 3.7. Includes commercial harvest from general, IFQ, and CDQ management programs and commercial pounds harvested by catcher/processors; NSR is not included in production volume and value.

Figure 2.3: Ex-Vessel and First Wholesale Gross Revenue and Production Volume, by Calendar Year and Fishery

Source: ADF&G fish tickets, eLandings, CFEC pricing based on COAR buying reports. Data shown by calendar year. Tabular results are shown in Tables 3.4 and 3.7. Includes commercial harvest from general, IFQ, and CDQ management programs and commercial pounds harvested by catcher/processors; NSR is not included in production volume and value.

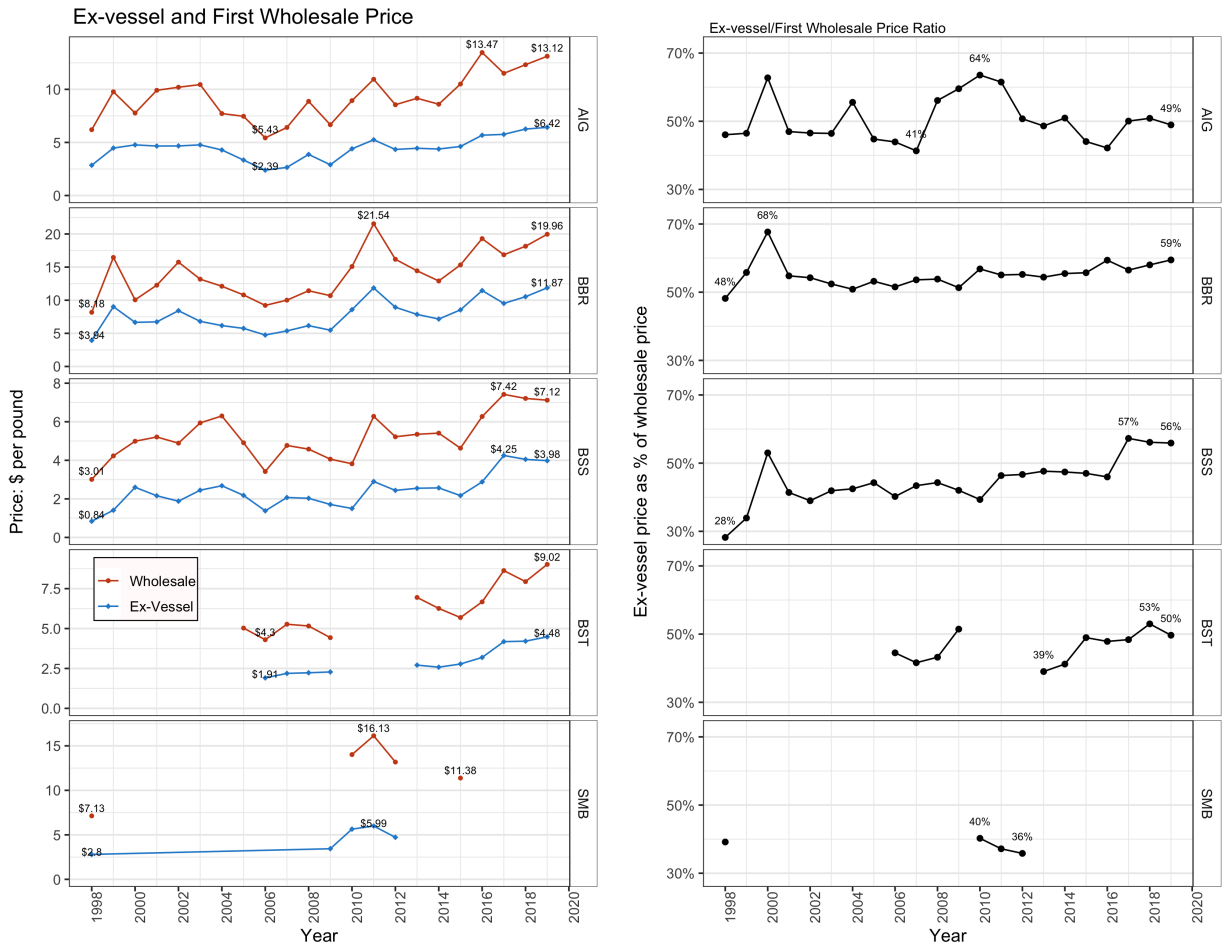

Figure 2.4 summarizes the corresponding time series of ex-vessel and first wholesale prices by crab fishery (excluding WAI, PIG, and PIK fisheries, for which data cannot be reported due to confidentiality), represented as weighted average price per pound, and displaying a relative comparison of ex-vessel and first wholesale prices (i.e., ex-vessel price as percentage of wholesale

price) over time.¹ Across all crab fisheries shown in Figure 2.4, during the most recent four-year period, both ex-vessel and first wholesale prices have reached peak levels relative to price levels over the last 20 years, with the exception of peak prices in the BBR fishery during 2011. Both ex-vessel and first wholesale price series for the BST fishery reached peak values to-date during 2019, at \$4.48 and \$9.02 per pound, respectively.

The right panel of Figure 2.4 reports the ratio of ex-vessel to first wholesale price, noting that both series represent weighted average prices over all categories of sales within a given fishery and year. Comparison of prices between the harvest and processing sectors is complicated by a number of factors, including price arbitration and differences in ex-vessel prices by harvest quota share type, regional differences, variation in timing of final sales from product inventory, and affiliations between entities in the respective sectors. Tables 3.4 and 3.7 report price statistics including weighted average values as well as mean and standard deviation calculated over observation-level unit values, which indicate substantial variation in both ex-vessel and first wholesale prices reported in the same year and fishery. Notwithstanding factors influencing variation in per-unit price values, Figure 2.4 provides a general indication of the relative value of ex-vessel and first wholesale prices over time. Since 1998, the price ratio in the AIG fisheries has varied between a low of 41% in 2007 to a high of 64% in 2010, and from a low of 28% in the 1998 BSS fishery to a high of 57% in 2017. In the BBR fishery, the ratio reached a high of 59% during 2019, except for the sharp increase in relative ex-vessel value in 2000, which was observed across fisheries that year. While the ratio of ex-vessel to first wholesale prices has been comparatively stable in the BBR and BSS fisheries after 2000, both exhibit a long-term upward trend.

¹A note on the term “price” as used in this report: a variety of price indices are presented herein that are derived from data on volume and revenue of sales of landed crab and/or finished crab product, collected and reported at different levels of aggregation. The typical representation of ex-vessel or first-wholesale prices in fishery management reports (e.g., NMFS, 2012) is fishery- or fleet-level average price, calculated as aggregate revenue divided by aggregate volume. Rather than representing the per-unit market “price” for a uniform commodity, this index is equivalent to the weighted arithmetic mean calculated over individual sale price observations, weighted by volume of individual sale. For example, ex-vessel price calculated as the quotient $\frac{\sum_i r_i}{\sum_i v_i}$, where $\sum_i r_i$ is the ex-vessel sale revenue and $\sum_i v_i$ is volume of sold landings, aggregated over all vessels $i \dots j$, is equivalent to the weighted arithmetic mean price calculated as $p = \frac{\sum_i v_i p_i}{\sum_i v_i} = \frac{\sum_i v_i \left(\frac{r_i}{v_i}\right)}{\sum_i v_i} = \frac{\sum_i r_i}{\sum_i v_i}$, where p_i is the individual price observation for the i^{th} vessel. In relevant tables and figures in this report, the aggregate revenue (or cost) per volume ratio is referred to as weighted average price; this representation of average per-unit value places greater emphasis on large volume sales (or sellers), relative to smaller volume sales. This is of particular importance where factors that may affect an individual transaction price are correlated with the volume of the transaction and/or the frequency of similar transactions, such as type of harvest quota used in sales of ex-vessel landings, or wholesale product form of individual processor sales. It is important to note that, with limited exceptions, observation level data used to prepare this report represent yearly aggregate sale volume and revenue reported by industry entities for different categories of goods, rather than transaction-level data representing sales of uniformly-defined commodities. For selected tables and figures displaying economic value per unit metrics (price, cost, wages, or other per-unit rates), medians and/or unweighted means and associated measures of dispersion are included where appropriate to represent the center and, in some cases, dispersion of observation-level data. In cases where data do not appear to conform to an approximately normal distribution, median value of observation-level price per-unit is reported rather than mean.

Figure 2.4: Ex-Vessel and First Wholesale Prices, Selected Fisheries

Source: NMFS AFSC BSAI Crab Economic Data, and CFEC pricing based on COAR buying reports. Data shown by calendar year. Tabular results are shown in Tables 3.4 and 3.7; note that ex-vessel and first whole prices shown in figure represent weighted mean of values derived from aggregate volume and revenue from calendar year sales reported in crab catcher vessel and processor EDR data; see table notes for additional detail on calculation and sourcing for price and value statistics.

Under the terms of the arbitration provisions incorporated into the structure of the CR program, annual determination of a non-binding price formula for Class A IFQ in each CR fishery is made by an independent third-party Formula Arbitrator. Although the formula is non-binding, it does act as a starting point for annual price negotiations between crab harvesters and processors, providing a consistent reference for evaluating price offers relative to the historical average split between ex-vessel and first wholesale price levels.

The values shown in Figure 2.4 are reported by calendar year and therefore pool prices from successive crab fishery years (i.e., 2017 BSS data late season 2016/17 and early season 2017/18 sales). Calendar year data on first wholesale sales includes sales from inventory and excludes production that was not sold during the same year. These factors may result in pooling non-contemporaneous ex-vessel sales of landed crab and the sale of associated finished product to a certain degree, and likely accounts for smaller inter-annual variations in the price ratio in fisheries with stable price arbitration formulae. As the values shown the 2.4 and associated tables also pool over all IFQ and

CDQ landings, variation in the price ratio is also driven by the relative differential between the arbitrated ex-vessel price for share-matched IFQ-A class quota landings and landings on CDQ and non-share-matched IFQ. Ex-vessel sales volume, revenue, and average price statistics for landings sold to processors (excluding CP catch processed on-board) are reported by quota category in Table 3.6, and indicate some variation in the relative share of volume and value of landings by quota type. Further analysis is needed to quantify these market effects more completely and assess the inter-sectoral distributional changes that they suggest, and causal factors including changes in quota share holdings (particularly the proportion of crab QS held directly and indirectly by CDQ groups; see Section 2.4.4 below).

A more comprehensive analysis of King and snow crab product markets, including product forms and associated wholesale and retail markets and import/export trade, are provided in the most recent *Market Profiles for Alaska Groundfish and Crab*(AFSC, 2019).²

2.2. Income and Employment

2.2.1 Processing Sector Employment and Wages

Table 3.10 presents data on crab processing labor employment and wages associated with CR program fisheries. Crab processing employment in 2019, as measured by hours of processing labor input (including employees at shore-base plants as well as processing employees on crab catcher/processors) is estimated at 452 thousand labor hours, an 18% increase from a historical low of 382 thousand labor hours in 2018. Aggregate wages paid to crab processing line employees across all CR fisheries during 2019 generated labor earnings of \$6.2 million, 29% greater than the previous year. Based on number of processing labor hours and wage payments in each CR fishery reported by crab processors, average hourly labor earnings over all CR fisheries reached \$12.81 per hour in 2019, approaching the previous high of \$12.83 per hour in 2016. The BSS fishery accounted for the largest share of processing labor hours and wages in 2019, at 333 thousand hours and \$4.6 million, both approximately doubling 2019 levels, while processing labor in the BBR fishery during 2019 accounted for 47 thousand hours and \$709 thousand in wages, declining by approximately 15% and 5% from 2018.

As indicated in Figure 2.5, inter-annual variation in aggregate processing labor hours and gross earnings are generally consistent with catch and production volume fluctuations. Average hourly wages (represented as daily earnings in Figure 2.5 assuming 12-hour daily shifts per employee), estimated from gross wage and payroll hours reported in EDR data, have varied between positive and negative inter-annual changes, while indicating a long term decline in real wage rates over the 2005-2014 period. This trend reversed beginning in 2014, with successive gains of 5% to 12% in annual average wages in the BBR and BSS fisheries, reaching \$12.83 and \$12.63 per hour in the 2016 BBR and BSS fisheries, the highest reported wage rates previously observed since 2004. These increases correspond with Alaska State minimum wage increases beginning January 1, 2015 under Alaska Statute 23.10.050 - 23.10.150, under which minimum hourly wage (in nominal terms) increased from \$7.75 to \$8.75 for 2015 and \$9.75 for 2016, with required annual inflation adjustments beginning in 2017 to maintain the minimum equivalent to \$9.75 in 2016 terms. Average hourly crab processing wages declined following 2016, to \$12.06 per hour in the BSS fishery, and \$12.19 in the BBR fishery.

² Available at https://repository.library.noaa.gov/view/noaa/25242/noaa_25242_DS1.pdf

An important factor in estimating average hourly wages paid to processing labor is the relative amount of overtime hours required by processors in a given fishery and year, with the associated overtime wage premiums contributing substantially to labor earnings. No data are available to identify overtime hours in the total processing labor hours reported in correspond with EDR data, such that inter-annual changes in base wage rates are confounded with variation processors use of overtime hours. Table 3.10 provides estimated indices of crab processing labor productivity in terms of labor input and cost (aggregate labor hours and wages) per unit output (1000 pounds of raw crab processed), and also provide piece-rate metrics of processing labor and wages that control for over-time premia.³ Aggregating over all crab fisheries and active plants, median plant-level labor hours per 1,000 pounds processed has ranged between 11.0 and 15.9 over the 2012-2019 period, and have been at the low end of the range in the most recent two years, while labor cost per 1,000 pounds ranged between \$132 and \$198 and do not show a discernible trend over the time period.

Table 3.12 reports the total number of individual crab processing workers employed by shore-based crab processing plants annually, by location of residence, aggregated to Alaska, Pacific Northwest states (Washington, Oregon, and Idaho), other U.S. states, and non-U.S.. Since 2014, the number of active crab processing plants has varied between 7 and 9, compared to 17 active plants in 2005, and varying between 12 to 15 plants from 2006 to 2013. The total count of processing employees reported, aggregated over all plants, increased from 2,512 in 2018, to 2,561 in 2019. The distribution of the processing labor pool by location of residence represents the effects of labor recruitment by processors sourcing from different regions of the U.S. and elsewhere. Historically, the proportional share of employment sourced from three regions (Alaska; Pacific Northwest states - Washington, Oregon, and Idaho; and other U.S states) has averaged approximately 30%-30%-40%, respectively. In the most recent crab seasons, however, the distribution has shifted toward a larger proportion of processing employees identified as residents of other U.S. states. In 2018, the number of Alaska state residents employed in crab processing declined from 671 to 515, and residents of Pacific Northwest declined from 320 to 317, while residents of other U.S states increased from 1,354 to 1,675, bringing the proportional employment shares by region to 21%-13%-67%. The relative attrition of Alaska and Pacific Northwest residents from the crab processing labor pool reported for the two most recent seasons may be an incidental effect, but may be an indication of increasingly competitive regional labor markets, labor recruitment efforts of processing firms, and/or longer-term demographic changes in Alaska fishing industry labor participation.

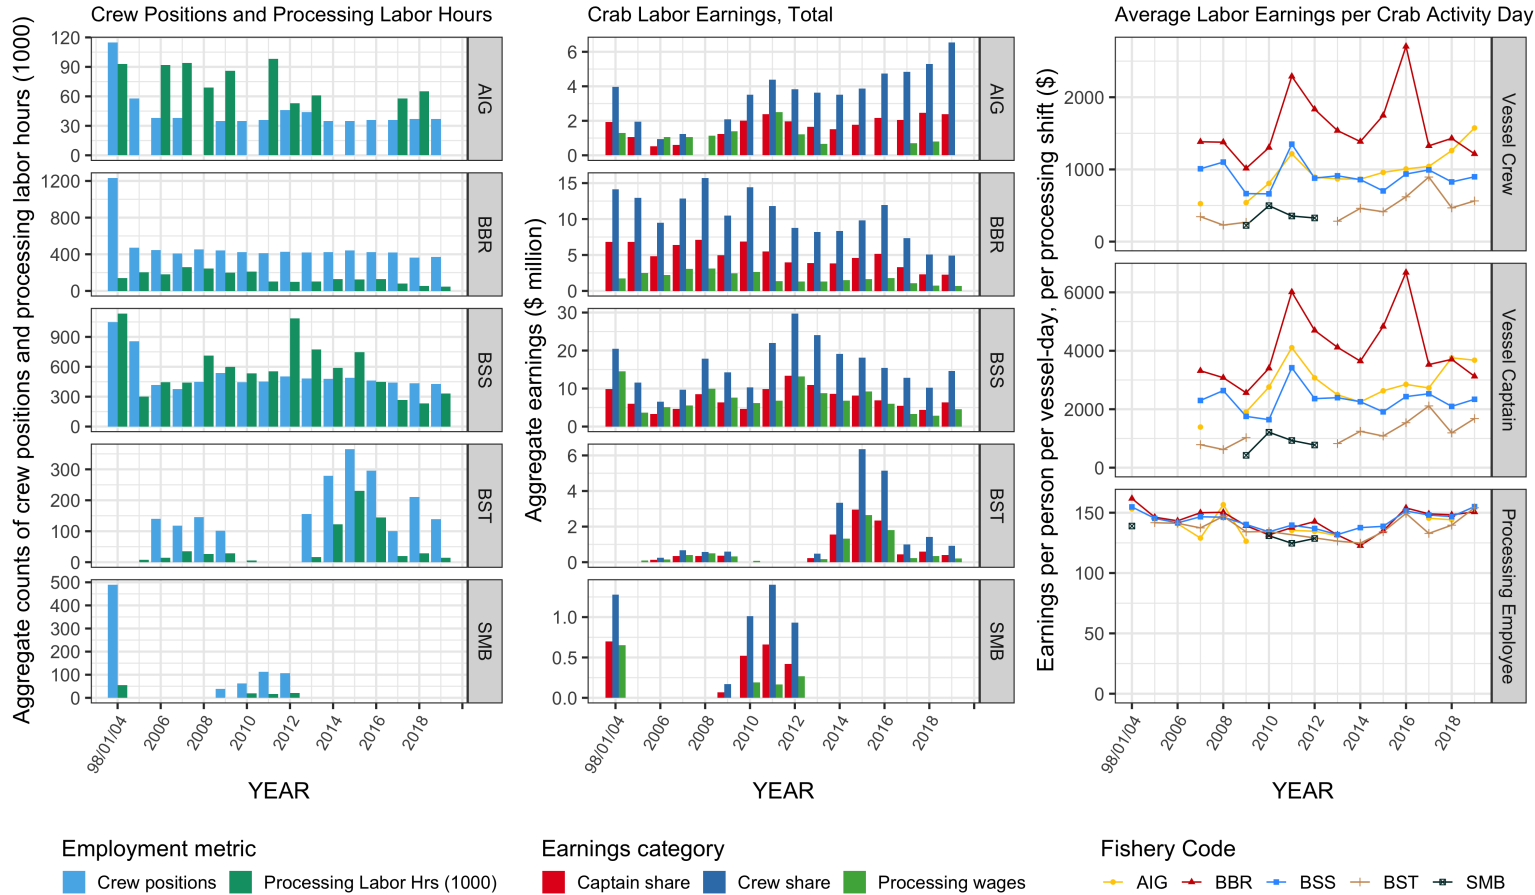

Employment and payroll expenditures for personnel other than processing line workers (supervisory and administrative personnel) in the crab processing sector are presented in Table 3.11 for the 1998/01/04 baseline period through 2011, and for 2012 to 2019.⁴ Data reported for 2012 to 2019 represent all supervisory and administrative personnel (all positions other than hourly processing line workers) employed by crab processing operations annually, inclusive of all processing and sales activity in all fisheries, and are not exclusive to crab. Aggregating over all shore-based processing plants that actively processed in crab fisheries during 2019, salaried and other non-processing employment totaled 1,488 individuals, and 215 per plant (median). Total wage and salary expenditures of \$64.4 million (exclusive of non-wage benefits, taxes, and other payroll and employment expenses) increased

³As measures of productivity, both metrics invert the standard output-per unit input metrics, such that a negative change shown in the productivity values reported in Table 3.10 indicate increased labor efficiency. Note that statistics shown for both indices use data from shore-based crab processing plants, and do not include catcher-processor labor data; see table notes for additional details.

⁴See table notes regarding discontinuities in processor sector salary cost data.

by 20% from 2018, while median salary payments per plant and per employee increased to the highest levels yet reported, at \$8.4 million per plant and \$49 thousand per salaried employee.

Figure 2.5: Harvest and Processing Employment and Compensation, Selected Crab Fisheries

Source: NMFS AFSC BSAI Crab Economic Data. Data shown by calendar year. Tabular data available in Tables 3.10, 3.16, and 3.18. Values shown for 98/01/04 represent the annual average over the three-year series. Data for PIK, WAI, and 2008 data for AIG fisheries are suppressed for confidentiality. Labor earnings per activity day represent aggregate crew and captain pay per vessel, pro-rated over vessel activity days; processing pay per day represents aggregate processing labor payments divided by number of 12-hour FTE shifts (aggregate processing labor-hours/12).

(a) 1998-2008 shows CV positions and participants only; 2009 shows data aggregated over CV and CP sectors 2005 and later crew positions data from ADF&G fish tickets. BSS crew position data were not collected in 2005.

(b) 1998-2008 data show total and median CV and SFP payments only; 2009 and later data show total and median crew payments over CV and CP sectors combined and processing employee payments over CP and SFP combined.

2.2.2 Harvest Sector Employment and Compensation

A summary of selected indicators from the most recent harvest sector employment and labor earnings data available for CR program fisheries are presented in Tables 3.13 to 3.17 and summarized in Figure 2.5. Two primary data sources are used to compute employment statistics for the harvesting sector. The eLandings catch accounting system collects trip-level information on the size of the crew onboard a vessel at each landing. These data provide the basis for estimating the number of crew positions across the fleet during a fishing season and for observing changes over time in the aggregate- and average per-vessel quantity of crew labor employed in crab fishing. For each CR fishery, EDR data report the value of fishing crew contract settlement payments (net labor payment after deductions for shared vessel operating costs) to vessel captains and fishing crews and the number of paid fishing crew members (excluding captains) at the fishery level for each vessel.⁵ In addition, EDR reporting of commercial fishing crew license data captures information on the number of unique individuals working as crew on crab fishing vessels as deckhands, vessel captains, and other positions in a given year (see Table 3.14 notes for details on crew license data). EDR labor payment data provides the basis for estimating aggregate labor earnings statistics, and the data reported on numbers of paid crew and counts of distinct crew licenses provides the basis for estimating the number of distinct labor participants in a given crab fishery, as well as the annual count of distinct crew participants over all crab fisheries.

The active fleet in the AIG fishery remained constant at 5, while participation in the BBR fishery increased by one to 56 vessels, declined to the lowest level to-date at 61 vessels in the BSS fishery, and vessels actively fishing in the WBT fishery during declined from 30 to 18. Based on the number of crew onboard participating vessels during each fishery (averaged over crew size values reported in eLandings catch accounting records for crab vessels), there were an estimated 974 crew positions in aggregate across all 67 vessels in CR fisheries in 2019, a 7% decline from the previous year, the lowest number of crew positions reported in CR fisheries to-date.⁶ The active fleet in the BBR fishery supported 370 positions, 5 more than the previous year, while lower participation in the WBT fishery during 2019 reduced the number of crew participating in the fishery from 211 to 139. Using counts of individual captains and crew members identified by license or permit number in EDR records, it is estimated that 601 unique individuals worked on-board crab fishing vessels during 2019 CR fisheries, 29 more than in 2018 which was the lowest number of individual crab crew participants reported since 2006 when the collection of this data began (Table 3.14). Of the 518 ADF&G commercial fishing crew license holders participating in CR crab fisheries during 2019, 162 (31%) were identified as Alaska state residents, as well as 23 (28%) of the 83 CFEC gear operator permit holders, indicating minimal change in the proportional representation of Alaska residents in the population of participating fishing crew in BSAI crab fisheries.

Total labor payments⁷ to crab vessel captains and crews totaled \$11.4 million and \$27.1 million during 2019, increasing from 2018 earnings by 16% and 23%, respectively (Figure 2.5 and Table 3.16).

⁵Prior to 2012, EDR data collection included number of individual crew members paid, reported by CR fishery; this data element was discontinued in revised EDR protocols implemented for 2012, and both Figure 2.5 and Table 3.13 show counts of distinct crew participants through 2011 only.

⁶Note that the aggregate count of vessels indicates the total number of distinct vessels, while the count of crew positions counts positions separately by fishery and vessel, such that individual crew members are counted more than once.

⁷In addition to direct labor earnings, income is derived by some crew members and many captains as lease royalties for crab IFQ quota shares. While this may become an increasingly important source of income as opportunities for investment in QS ownership are advanced, there is no evidence in data available to date that the proportion of CR

Aggregate crew earnings in the AIG fishery during 2019 increased by 24% to \$6.6 million, and captain earnings declined by 3% to \$2.4 million. Aggregate crew earnings in the BSS fishery increased by 43% to \$14.7 million and captain earnings increased by 45% to \$6.4 million, while crew and captain earnings in the BBR fishery each declined slightly, to \$4.9 million and \$2.3 million, respectively. Earnings in the BST fishery also declined substantially, with captain earnings of \$410 thousand reduced by 32%, and aggregate crew earnings falling 35% from 2018 to \$920 thousand.

The effects of rationalization on crew earnings and the relative distribution of economic benefits between quota share owners and active crews working in the crab fishery remain ongoing concerns for fishery managers. Identifying trends in labor earnings is complicated by the lay share system that is commonly the basis of crew compensation in commercial fisheries. Unlike typical labor market conditions, where prevailing wage rates are substantially stable from year-to-year, the value of crab crew pay settlements under the lay share system is highly influenced by the price and market value of landed crab as well as prices and costs of other factor inputs (e.g. fuel), both of which are exogenously determined by larger external markets. It is therefore difficult to clearly associate the effect of management changes under rationalization and changing productivity of the fishery with any trend in the status of crew earnings. The volatility of both crab prices and catch levels over the period following rationalization contributes to highly variable annual results for both aggregate- and per-vessel average payments to crab crews and captains as described above.

Median seasonal settlement payments to vessel crews (vessel-level aggregated settlement payments to the fishing crew, exclusive of payments to captain) in the BBR fishery initially increased substantially following rationalization, from \$59 thousand on average during the pre-rationalization reference years (1998, 2001, and 2004), to \$128 thousand in 2005 (excluding crab C/P's), and have varied between \$102 thousand to \$214 thousand from 2006 to 2017. Median vessel-level crew and captain settlement earnings from 2019 BBR fishing, at \$79 thousand and \$39 thousand, respectively, returned to the low end of the range established since rationalization of the fishery 2005. The median crew settlement cost per vessel in the BSS fishery during 2019 was \$200 thousand, and \$97 thousand median captain pay per vessel.

As shown in Figure 2.5 (right panel), average pro-rata daily earnings for crew and captains across all CR fisheries were in a declining trend from 2011 to 2014, but from 2015 to 2016, increased sharply in the BBR fishery, and more modestly in AIG and BSS fisheries. Despite reduced gross earnings in the BBR fishery during 2018, the effect of higher ex-vessel price and reduced number of days-at-sea (Table 3.18⁸) resulted in average pro-rata daily captain and crew earnings increasing somewhat, with crew members earning \$1,400 per day on average, and captains earning approximately \$3,600 per day on average. With 2019 gross earnings continuing to decline in the BBR fishery, but fishing activity increasing by 16% to 723 vessel-days, average daily crew and captain earnings declined in 2019. In contrast, the total vessel days at sea in the BSS fishery during 2018 declined despite the increased TAC. The effect of the reduced ex-vessel price during 2018 resulted in average daily earnings to captains and crew declining from the previous year, to \$820 per individual crew member, and \$2,340 per crab vessel captain.

Table 3.17) reports median-vessel crab crew earnings in terms of “gross-share” (value of payments to the captain and crew as a share of gross ex-vessel revenue), and median “net share” (share of fishery quota share pools held by crab crew members has changed in recent years (see the section on QS holdings below for further detail).

⁸See Figure 2.13 and Table 3.18 and associated footnotes for details on data sources for vessel activity-days used for daily pro-rata earnings calculations.

ex-vessel revenue less deducted operating costs) for years prior to 2011. The variability of crew settlements, from 1.5 to over 3 times the median earnings in the BBR fishery prior to the CR program, and from 1.5 to 5 times the pre-CR levels in the BSS fishery, correspond to variability in catch levels and ex-vessel prices. In contrast, gross revenue share percentage values (calculated as the ratio of combined captain and crew share payment costs to gross ex-vessel revenue) have remained relatively constant in both BBR and BSS fisheries over the 2006 to 2019 period, but appear to have shifted from a range of 22-23% during the first 5-6 years under the CR program, to 17-19% during the more recent seasons. Gross labor share percentages in the CR fisheries in 2019 held steady or declined slightly, with 18% in total labor gross share aggregated over all CR fisheries declining from 20% in 2019, reaching the lowest level post-rationalization.

2.3. Harvest Sector Operating and Production Costs, and Net Earnings Indices

Statistics reporting information available for crab vessel operating expenditures are summarized in Figure 2.6; in addition to tables and figures reporting vessel crew labor and quota costs presented in other sections, Tables 3.19, 3.20, and 3.21 provide summary statistics for available data on food and provisions, bait, and fuel costs in the harvest sector over the baseline-to-current period. Total aggregated expenditure by fishery sector and per-vessel or per-plant median expenditure are presented for cost data elements where data of sufficient quality to warrant dissemination are available through the current period.⁹

Total fuel consumption and costs reached 2.6 million gallons and \$7.3 million over all CR fisheries and vessels in 2019, increasing 12% and 9% from 2018, slightly offset by a modest decline in average per-gallon fuel costs. Fuel costs of \$1.6 million in the AIG fishery increased 26% from 2018 and in the BSS fishery increased 19% to \$4.1 million, while fuel costs in the BBR fishery increased only slightly. Table 3.21 also reports median and total vessel fuel consumption (gallons purchased) by fishery, and average fuel cost per gallon.¹⁰ Total bait expenditures across all fisheries and vessels reached \$3 million during 2019, with the BSS fishery accounting for the majority of bait expenditures, with \$1.4 million during 2019 compared to \$0.5 million in the BBR fishery. Reported expenditures for food and provisions costs totaled \$1 million over all fisheries during 2019, a small increase from 2018.

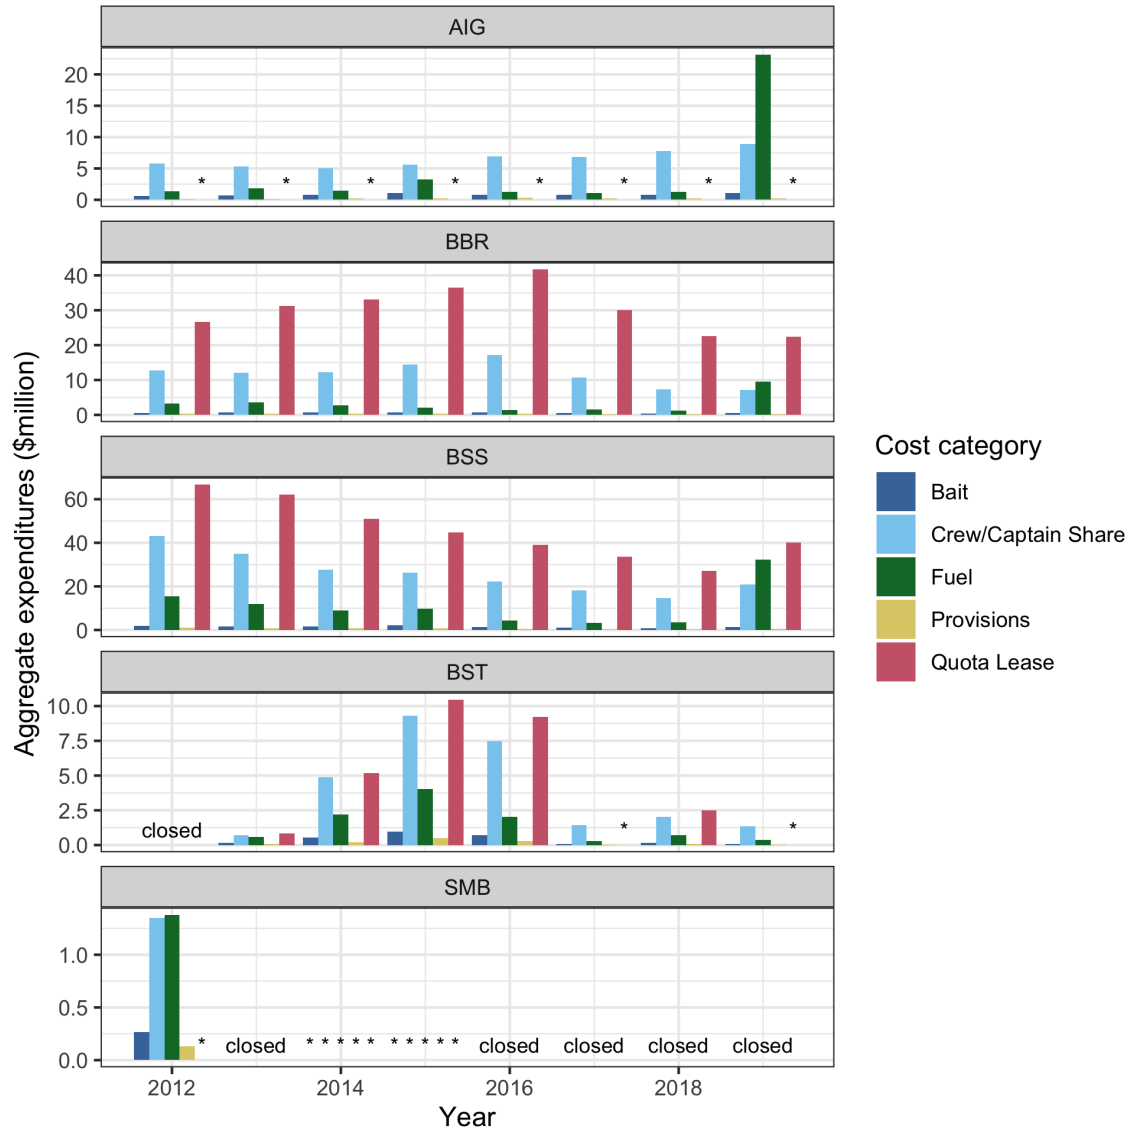

2.3.1 Harvest Sector Net Earnings Indices

Tables 3.23 and 3.24 present tabulations of vessel- and sector-level cost and earnings analyses using the most complete cost and revenue data available for vessels operating in the Bering Sea snow crab and Bristol Bay red king crab fisheries, as well as aggregate results calculated over all CR fisheries, during 2012 through 2019. Results presented as gross ex-vessel profit in the tables, and illustrated in Figures 2.7 and 2.8, provide relative indices of gross profitability of vessels operating in the respective crab fisheries, recognizing that additional costs not accounted for in available data are

⁹Cost elements that were discontinued in the crab EDR data collection program as of 2012 are not included; see the 2013 edition of this report for additional detail on discontinued harvest and processing cost data collected prior to 2012. Analysis of trends in operating and/or capital expenditures over time, or in relation to production or revenue, is inhibited by a variety of factors. In addition to data quality limitations for specific cost elements collected prior to 2012 (vessel fuel expenditures and quota lease costs), discontinuities in data time series also limit use of these data. As with other information contained in this report, catcher-processor sector data in many cases cannot be reported at the sector level due to confidentiality requirements.

¹⁰Table 3.22 provides a compilation of diesel prices per gallon from 1999 to current for the five principal fueling ports for Alaska fishing vessels.

Figure 2.6: Aggregate Crab Vessel Operating Costs, by Cost Item and Fishery

Source: NMFS AFSC BSAI Crab Economic Data. Tabular data available in Tables 3.16, 3.19, 3.21 and 3.25. Values shown represent total annual expenditures by cost item for calendar years 1998-2019 where available, or 2012-2019 otherwise, aggregated over all vessel entities reporting except where data are suppressed for confidentiality (as indicated by “(*)”). Cost data shown include all cost items for which data are available, but do not represent a comprehensive accounting of operating expenditures. Change in data collection protocols implemented beginning 2012 discontinued reporting for several expenditure items, and disaggregated expenditures for food and provisions by crab fishery. Data for fuel and quota lease expenses collected prior to 2012 are not shown in figures due to data quality limitations.

substantial, including other direct vessel operating costs, maintenance and repair, overhead, finance, and other fixed costs. As such, the estimated gross profit residual does not directly measure, and is greater than, vessel operating profit. In essence, these separate totals and averages into separate tables rather than in adjacent columns as in most other tables in this report, except that quota

lease costs are treated differently in the vessel-average values than in the harvest sector or fleet aggregate values.

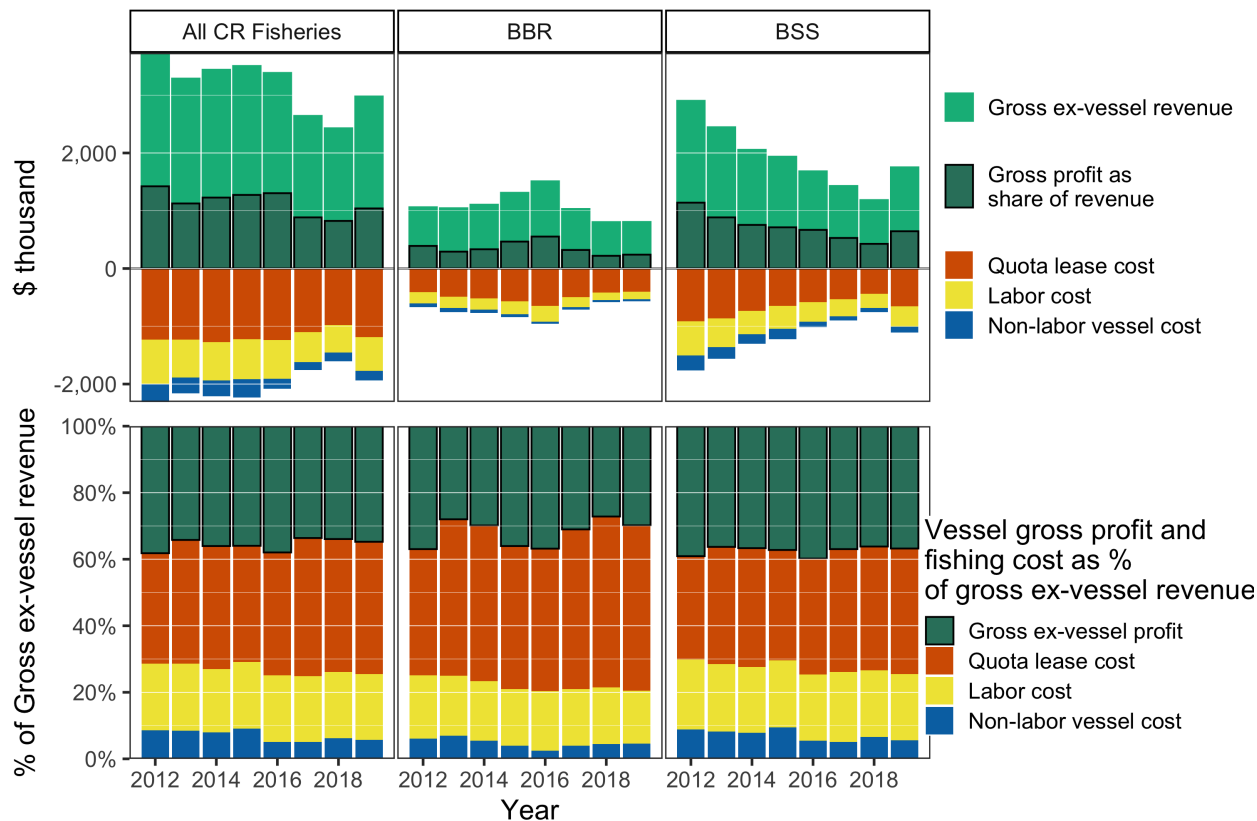

CR fisheries in aggregate generated average gross ex-vessel revenues ranging from \$2.4 million to \$3.7 million per-vessel between 2012-2018, from landings ranging from 450 thousand pounds to 1.25 million pounds. In 2019, average ex-vessel gross revenue, aggregating across CR fisheries, increased by 23% from \$2.43 million in 2018 to \$2.98 million in 2019, from crab landings of 474 thousand pounds. As a proportion of total ex-vessel pounds and value of catch in CR program fisheries, the average quantity of leased quota pounds reported by vessels comprises approximately 74% of landings on average over the period, with quota lease costs ranging from 33% to 42% of gross revenue. For 2019, quota lease costs of \$1.9 million accounted for 40% of average vessel gross crab landing revenue, leaving a gross revenue residual after quota lease royalties of \$1.73 million. Vessel non-labor operating costs of \$170 thousand during 2019 include vessel fuel, bait, and provisions costs, accounting for 6% of gross revenue, leaving an average gross revenue residual after all non-labor vessel costs of \$1.62 million, or 54% of ex-vessel gross revenue. Average vessel-level crab fishing labor costs over all CR fisheries paid as crew and captain share payments in 2019 totaled \$583 thousand per vessel, 20% of ex-vessel revenue, bringing average vessel-level operating and quota lease costs for 2019 BSAI crab fishing to \$1.94 million, 65% of gross revenue. The remaining \$1.04 million gross profit after deducting costs represented a 35% gross profit margin, compared to gross margins of 34% to 38% from 2015 to 2018.

In the vessel-level analysis shown in Figure 2.7 and Table 3.23, quota lease (royalty) costs are represented as a vessel cost of crab harvest, in order to financially account for the diversion of sales revenue from a vessel owner's balance sheet. Quota lease royalties are commonly paid to the quota holder as a direct share of gross ex-vessel value of the leased quota pounds. Labor share payments to crew and captain are typically paid on the basis of gross residual revenue after lease royalties and fishing costs (fuel, bait, provisions) are paid (Gross-residual non-labor in Table 3.23). In the context of gauging the economic benefits generated by the fishery, in contrast to the financial performance of vessel operations, it should be understood that crab harvest quota is not an economic input that could be redirected to alternate productive use outside of the crab fishery. As such, its use by a particular crab vessel doesn't represent an economic opportunity cost in the same sense that crew labor or vessel capital does. Rather, quota lease royalties represent transfer payments within the assemblage of crab vessels and QS holders rather than an economic cost of ex-vessel production. Reflecting this distinction, the harvest sector level analysis shown in Figure 2.8 and 3.24 treats quota lease royalties as a distribution of gross ex-vessel profit from the vessel sector to the quota sector, treating only vessel labor and materials expenses as operating costs.

Results shown for 2014 to 2019 in Figure 2.7 and Table 3.23 indicate that a slightly smaller proportion of vessel-average landed pounds in the BBR fishery are reported as leased in EDR data, 73% on average over the most recent five years, compared to 74% in the BSS fishery. Vessel-average quota lease costs in the BSS fishery represent a substantially smaller share of gross ex-vessel revenue, 35% on average compared to 45% in the BBR fishery (consistent with the proportion of leased pounds and average lease rates of approximately 50% and 65% for BSS and BBR quota)¹¹. Proportionally, labor and vessel expenses in the BBR fishery, at 16% and 5% of gross revenue in 2019, were marginally lower than those in the BSS, at 20% and 6%, respectively. On this basis, average vessel-level gross profit margins of vessels in the BBR and BSS fisheries since 2014 have averaged 32% and 37%,

¹¹More precisely, weighted average lease rates over all quota types reported in Table 3.25 in the BSS and BBR fisheries average 48% and 64% over the 2012 - 2019 period

Figure 2.7: Vessel-level mean operating costs and gross revenue residuals, BBR, BSS, and all CR fisheries in aggregate, 2012 through 2019

Source: NMFS AFSC BSAI Crab Economic Data. Tabular data available in Table 3.23. Values shown represent mean vessel-level earnings and expenditures by cost item for calendar years 2012-2017, averaged over all vessel entities reporting except where data are suppressed for confidentiality. Cost data shown include all cost items for which data are available, but do not represent a comprehensive accounting of operating expenditures.

respectively. In these results, the relative financial performance of vessels operating in the BBR and BSS fisheries is principally a function of the differential in quota lease rates between fisheries, which is a result of the higher profit margins in the BBR fishery historically, given lower fishing costs in Bristol Bay and higher market value of red king crab.

It is not readily apparent how much of the 60% to 80% of the volume of quota landings that are reported as leased in EDR data is owned independently of the pool of owners operating active crab vessels, and there is substantial variation across the fleet in the relative proportion of leased pounds to ex-vessel landing volume. The results shown in the vessel-level analysis represents the effects of quota lease costs Without controlling for true arms-length transfers of income from vessel owners to third-party QS holders.

Figure 2.8 demonstrates an alternative perspective on harvest sector economic performance of CR Program fisheries, treating quota lease royalties paid by vessel operations as a distribution of aggregate gross profit in the harvest sector. Over all CR fisheries, accounting for operating labor and materials costs captured in EDR data, gross profit ranged from a high of \$220 million in 2012 to a low of \$121 million in 2018, with gross profit margins of 71% to 75%. Quota lease royalty transfers averaged 51% of the gross profit margin over the period, ranging from \$102 million in 2012 (46%

of gross profit) to \$65 million in 2018 (54% of gross profit). Fleet aggregate gross revenue in the BBR fishery reached a high for the period in 2016 of \$95 million, and a low in 2018 of \$44 million, corresponding to gross profits of \$75 million and \$35 million, respectively. Over this recent period, gross profit margin in the BBR fishery has trended from 74% to 8%, with a substantial increase in the proportion of gross profits accruing to QS holders as lease royalties, from 51% of fleet aggregate gross profit in 2012 to 62% in 2019. In the BSS fishery, fleet-aggregate gross revenue declined each year over the period 2012 to 2018, from \$148 million in 2012 to \$54 million in 2018, corresponding to gross profit declining from \$159 million in 2012 to \$55 million. The decline was reversed in 2019, with gross revenue increasing to \$107 million and gross profit to \$79 million. Gross profit margins have maintained at 70% to 74% over the period, with the proportion accruing to BSS QS owners increasing substantially, from 44% in 2012 to 51% in 2018.

Note that the trend toward higher quota lease costs at the vessel level, and higher distribution of gross profits to QS owners within the harvest sector, are driven primarily by an increase in the volume of quota pounds being leased as a proportion of total pounds landed. This corresponds to the reduced number of active vessels as the fleet adjusts to reduced TACs. Lease rates, the proportion of ex-vessel value per pound leased paid to QS holders, have remained largely constant over the period as reported by vessel owners in EDR data (see Section 2.4.1). Also, any apparent systematic differences in financial performance between fleets operating in distinct crab fisheries may be more of a function of the degree to which the fleets and the population of associated businesses are distinct between fisheries, rather than differences that are intrinsic to the fisheries and their associated markets.

2.4. Quota Holdings, Leasing Activity, and Quota Share Sale Transfers

The following section provides information regarding lease market activity associated with transfers of Individual Fishing Quota (IFQ) and Individual Processing Quota (IPQ) annual permits in the CRP, and several indices measuring changes in the status of crab harvesting and processing quota share (QS and PQS, respectively) holdings among eligible shareholder entities under the CR program.

2.4.1 Harvest Quota Lease Market Activity and Average Prices

Table 3.25, summarized in Figure 2.9 displays aggregated results for indicators of quota lease market activity and value reported for crab vessels that participated in the quota lease market (as indicated by reporting quota lease costs in EDR data) during 2012 through 2019 calendar year CR fisheries¹². Indicators shown in Figure 2.9 include weighted average statistics for average lease rates (lease price as percentage of ex-vessel price) per vessel, aggregate volume of quota pounds leased as a

¹²EDR data collection for the 2012 calendar year implemented newly revised data collection protocols under Amendment 42 to the BSAI King and Tanner Crabs FMP (78 FR 36122, June 17, 2013); prior to the implementation of EDR revisions, data collected regarding EDR lease activity and costs did not differentiate between transfers of quota between independent entities that were priced at competitive market rates from non-arms-length transactions (i.e., those between affiliated entities or other types of non-market transfers characterized by nominal prices or in-kind compensation). For this reason, EDR quota lease data collected previously for 2005-2011 fisheries was not deemed of sufficient quality to disseminate. For collection of data associated with 2012 and later fisheries, revised EDR forms employ revised instructions specifying quota lease data elements as market-rate or negotiated-price transfers. Also note again that CR crab fisheries are managed on a July-June seasonal calendar, such that statistics shown for 2015 BBR and BSS calendar year fisheries are based primarily on data reported for the 2014/15 BSS season and 2015/16 BBR season.

Figure 2.8: Fleet-level aggregate operating costs and gross revenue residuals, BBR, BSS, and all CR fisheries in aggregate, 2012 through 2019

Source: NMFS AFSC BSAI Crab Economic Data. Tabular data available in Table 3.24. Values shown represent aggregate earnings and expenditures by cost item for calendar years 2012 to 2019, summed over all vessel entities reporting except where data are suppressed for confidentiality. Cost data shown include all cost items for which data are available, but do not represent a comprehensive accounting of operating expenditures.

percentage of total landings, and aggregate quota lease cost as a percentage of gross ex-vessel revenue. Table 3.25 also reports the number of vessels leasing quota, volume (in pounds) and cost reported for crab vessels active during fishing year, including total quantities summed over all reporting vessels, and average values (both median and mean) per vessel. Note that lease market statistics are exclusive of crab vessels that do not report quota lease costs (i.e., solely harvest the

vessel owner's IFQ), which in recent years generally comprise approximately 10 vessels in the active fleets in the respective fisheries; as such, the value of lease market indicators reported in this section, including average and aggregate pounds leased as a percentage of total landings, may differ from similar metrics reported in other sections (e.g., 2.3.1) that are inclusive of all vessels active in the respective fisheries and years. Median and arithmetic mean values computed over leasing vessels are presented together to show information on the variation in reported values within each fishery and quota-type stratum, with higher relative mean values indicating the presence of a subset of high-value data points in these data (i.e., a right-skewed data distribution). Harvest quota types are categorized as the following: Catcher Vessel Owner Class A (CVOA) IFQ; Catcher Vessel Owner Class B (CVOB) IFQ and Catcher/Processor Owner (CPO) IFQ; Catcher Vessel Crew (CVC) IFQ and Catcher/Processor Crew (CPC) IFQ, Community Development Quota (CDQ), and Adak Community Allocation (ACA).

The total volume of leased quota in the BBR fishery during 2018 and 2019, aggregating over all IFQ and CDQ pounds leased, represented 89-90% of aggregate ex-vessel pounds landed in the fishery by leasing vessels, a notable increase compared to previous seasons, when leased quota varied annually between 78% and 84% of annual pounds landed. Similarly, aggregate quota costs in the BBR fishery increased proportionally during 2018 and 2019; after ranging between 48% and 53% of total ex-vessel value over the previous six years, quota lease royalties paid by crab vessel operators increased to 57-58% of aggregate ex-vessel revenue. A similar increasing trend in aggregate lease volume relative to total catch is evident in the BSS fishery, with the volume of quota leases reported for by 51 vessels (out of 61 active in the fishery) during 2019 increasing in aggregate to 89% of ex-vessel pounds landed, compared to the range of 81% to 84% observed prior to 2017. However, quota lease payments as a proportion of ex-vessel value have only modestly, if consistently, increased in the BBR fishery in recent years, from 39% in 2014 to 43% in 2018.

The relative variability of crew-share IFQ (CVC+CPC) lease volume and value relative to total ex-vessel sales on crew-share quota volume and value indicated by Figure 2.9 is notable. This is indicative of both the relatively small number of crew share leases reported, resulting in higher statistical variation, but is also a reflection of the more informal nature of lease arrangements for crew share compared to CVO Class A quota. In cases of quota held by hired crew members, up to 100% of the ex-vessel value may be paid to the crew member, and may not be reported in EDR data as a "market-rate and/or negotiated price" transfer.

In contrast to more dynamic changes in the volume of lease activity in recent years, quota lease rates (i.e., the per-pound lease cost as a percentage of ex-vessel value) have remained quite stable. The median and weighted average lease rates in the BBR and BSS fisheries shown in Table 3 and Figure 2.9 vary somewhat by quota type within fishery, but are generally quite consistent over time. The median lease rate reported for BBR CVO Class A allocation has remained at 62% to 63% of ex-vessel price, and between 62 to 65% as a weighted mean. A lease rate premium of 2-5% is typically reported for CDQ and non-share-matched IFQ types over the rate received for BBR CVO Class A, and the 67% average rate reported for 2018 for both CDQ and Crew IFQ (CVO and CPO), as compared to 64% for CVO IFQ, was consistent with this pattern. The median lease rate for CVO Class A quota in the BSS fishery has remained constant over the period at 46% of ex-vessel value, and varied slightly on a weighted mean basis, between 46-49%, but the premium paid for CDQ quota is consistently larger, typically 4% to 6% over rates paid for CVO Class A quota.

During the first year of rationalization, 23 distinct crab harvesting cooperatives were formed by vessel and QS owner entities, and a rapid shift toward pooling of IFQ within cooperatives occurred

in response to program incentives, as noted above. As of 2009, only a small fraction of the issued IFQ was landed by non-cooperative vessels, and beginning with the 2009/10 crab season, virtually all IFQ has been pooled within harvest cooperatives.¹³ Correspondingly, since 2008/09, virtually all IFQ lease transactions registered with NMFS (Table 3.26) have taken place within harvest cooperatives, primarily in the form of IFQ assignment to a cooperative by member QS holders. Since 2005, leases registered by cooperatives have ranged from 144 during 2005/06, to 342 in 2014/15, declining to 215 leases registered in 2017/18. Noncooperative IFQ leases (i.e., leases of IFQ held directly by QS holders, and not assigned to cooperatives) were most common in the first year, with 113 in total, declining to 16 by 2007/08, and four in 2011/12, the last year such transfers occurred. Processing quota permit (IPQ) leases have varied between a low of 25 in 2010/11 to a high of 55 in 2015/16, averaging 36 per season over the CR Program period to date. PQS sales are relatively infrequent, from none to less than 10 in most years.

2.4.2 Quota Share Sales and Average Prices

Permanent sale transfer of CR Program QS and PQS is permitted under a framework of rules intended to prevent excessive share consolidation and, in the case of PQS, maintain regional and community level processing capacity and employment associated with crab processing histories of individual processing plants (as discussed previously). As such, the frequency and volume of QS and PQS sales discussed below are strongly influenced by regulation of the respective markets. The total number of QS sales reported over the course of the program has ranged from a peak of 329 during 2006/07 to a low of 86 registered in 2015/16, with 167 sales in 2019/20 (Table 3.26). Sales of PQS peaked during the early period of the CR program, with 42 transfers during 2008/09, substantially higher than any other year. No PQS sales occurred in five of the last 17 crab seasons, including 2019/20; the number of IPQ transfers over the most recent seasons has been relatively variable, with 55 and 50 transfers in two of the last five seasons.

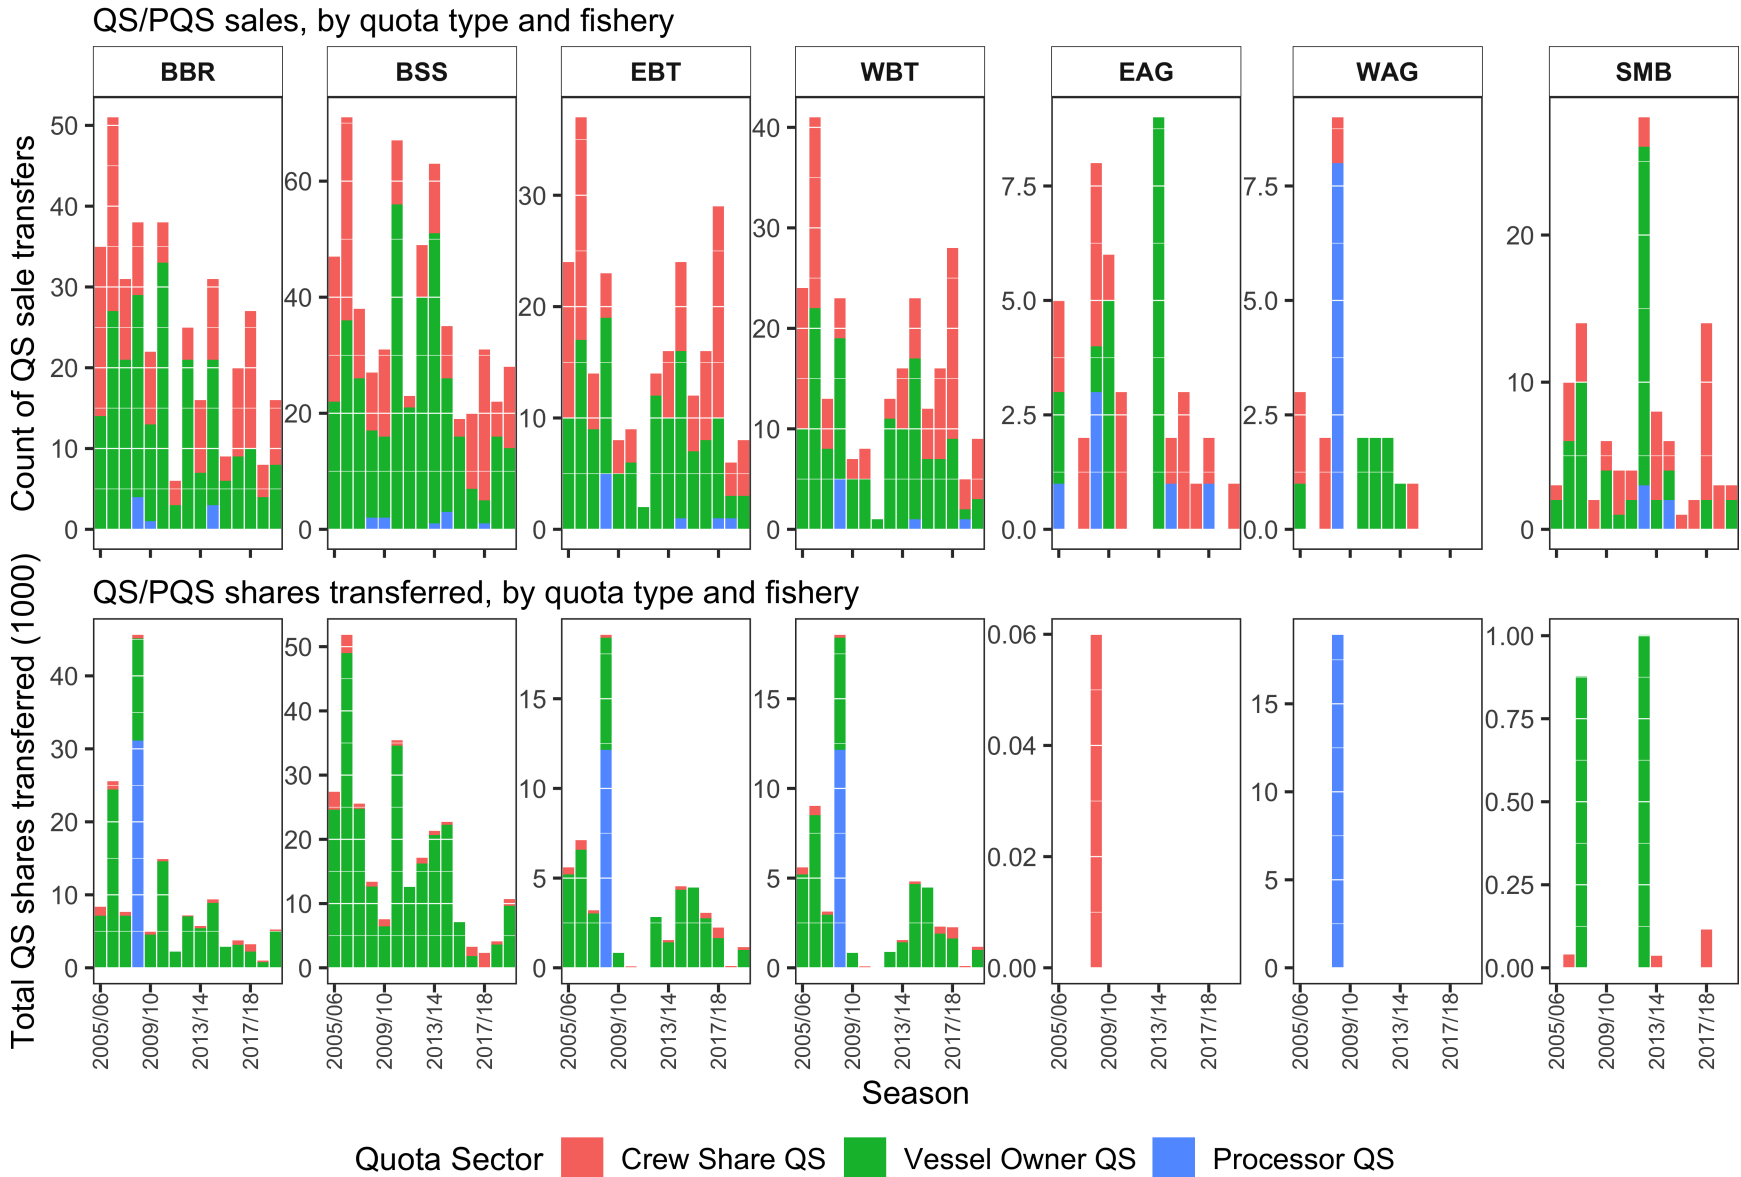

¹³For the 2009/10 crab season, the Inter-Cooperative Exchange (ICE) harvest cooperative was formed. As of the 2012/13 season, 65% of crab IFQ was issued to ICE, with the remaining IFQ issued to eight other cooperatives; the Alternative Crab Exchange (ACE) harvest cooperative was formed for the 2013/14 season out of concerns regarding ICE membership compliance with the Fishermen's Collective Marketing Act of 1934 (FCMA; 15 U.S.C. SS 521 et seq.), and the membership of the two have held approximately 31.5 and 34% of the total QS pool respectively, aggregated over all CR program fisheries. Nine other harvest cooperatives that participated over the course of the CR Program represent smaller QS pools, between 1.7 and 7.9% of the total allocation during recent seasons. Among other effects of formation of the ICE and ACE cooperatives, administrative requirements related to IFQ transfer applications were largely obviated, facilitating assignment of 100% of issued IFQ to harvest cooperatives. See the Crab Cooperative Permits and Information section of NMFS AKRO Crab Rationalization webpage for more information: <https://alaskafisheries.noaa.gov/fisheries/bsai-crab-rationalization>.

Figure 2.9: Crab Harvest Quota Lease Market Indicators

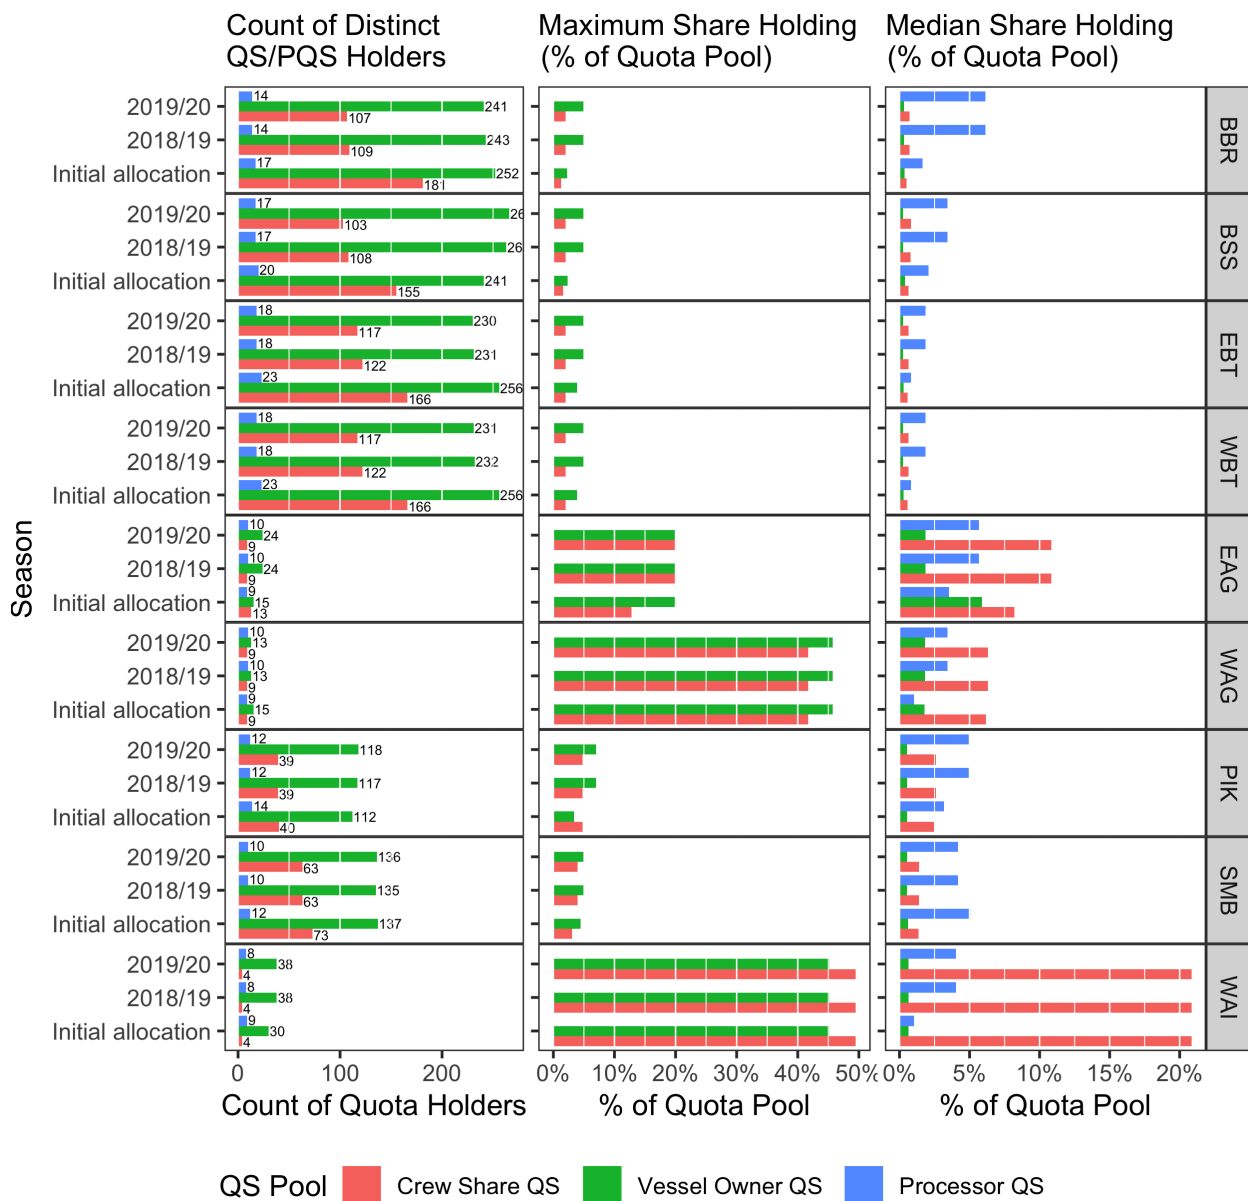

Source: NMFS AFSC BSAI Crab Economic Data. Tabular data available in Table 3.25. Lease data shown represent “market-rate and/or negotiated price” lease transactions as reported for active crab fishing vessels in the 2012 through 2019 Crab EDR, which includes both true arm’s length transactions as well as transfers between related parties at market-rate value. Quota lease data collected for earlier years is not reported due to data quality limitations. Harvest quota types are categorized in this report as the following: CVO A - catcher vessel owner Class A IFQ; CVO B + CPO - catcher vessel owner Class B IFQ and catcher/processor owner IFQ; CVC + CPC - catcher vessel crew IFQ and catcher/processor crew IFQ. Statistics reported represent results pooled over all quota types and/or regional designations within each category.

Figure 2.10: QS and PQS Sales

Source: NMFS AKRO RAM division, Quota share transfer data. Tabular data presented in Table 3.27. Counts of QS sales are non-confidential, however, number of shares transferred in individual QS sales is confidential information and aggregate QS units sold is suppressed in the figure where fewer than 3 transfers occurred during the reporting year.

Figure 2.11: CR Program Harvest and Processing Quota Share Holdings, Initial Allocation, 2018/19, and 2019/20 Seasons

Source: NMFS AKRO RAM Division, quota share holders files.

Tabular data available in Tables 3.32 and 3.36.

More detailed information on QS/PQS sale transfers by CR fishery and QS type is shown in Tables 3.27 and 3.28, and Figure 2.10, with counts of entities transferring, total and median volume of QS units transferred, and median price per QS unit shown by fishery, season, and quota type. During the first two years of the CR program, sales of catcher vessel crew share (CVC QS) represented a large proportion of the number of total QS transfers, though representing a small fraction of total QS shares transferred. Subsequently, the relative proportion of CVC QS sales diminished, with catcher vessel owner (CVO) QS sales becoming the predominant type in most years; in 2017/18, however, the number of CVC QS sales increased to 97 across all CR fisheries,

exceeding the 34 total CVO QS sales during 2017/18, and with 2.3 million CVC QS units transferred in the BSS pool and 1 million units in the BBR pool represented approximately 8% of both share pools. In contrast, 10 sales of BSS CVO QS were completed for 2017/18, totaling 2.2 million QS units (less than 1% of the pool). Transfer activity in the QS markets was particularly low during 2010/11 and 2017/18, with both number and volume of QS transfers during 2019/20 increasing from the distinct lull in market activity during the prior two seasons.

PQS sales have been infrequent through the duration of the CR program, with the largest number occurring in 2008/09 at 27 over all, including 4 sales in the BBR fishery totaling 32.2 million PQS units (7.8% of the PQS pool), 5 in the each of the EBT and WBT fisheries totaling 12.2 million units (6% of each pool), and 8 in the WAG fishery totaling 18.9 million units (47% of the pool). Prices at each of these points have averaged \$0.10 for BBR PQS, \$0.05 for EBT PQS, and \$0.07 for WAG PQS. Following the 2008/09 season, too few PQS sales have been completed in any year to enable publication of aggregate statistics.

Recent QS market trends toward increased sales and low per-unit QS transfer prices correspond with historically low TAC levels in the BBR and BSS fisheries in recent seasons, particularly in the CVC QS pool. The relatively high number and volume of transfers in the BSS CVC pool during 2016/17 and 2017/18 (totaling 39 separate transfers of 3,739 QS units), and low per-unit QS price (\$0.31 and \$0.29 per unit, respectively) approached the market conditions seen during the initial years following rationalization, and coincided with seasons when the BSS TAC was historically low. With BSS fishery productivity improving in the 2018/19 and subsequent seasons, per-unit CVC QS price increased to \$0.53, the highest price to-date. Similarly, during 2020/21 as the the BBR TAC declined to the lowest level to-date at 2.65 million pounds, average per-unit BBR QS price declined to historical lows of \$0.32 for CVC and \$0.53 CVO QS.

Table 3.30 presents a comparison of contemporaneous QS transfer prices and IFQ lease prices where sufficient observations allow reporting. Although harvest quota share privileges represent a share interest in the future stream of TAC allocations, which are indeterminate, brokered sales of CR program QS are typically conducted on the basis of price per pound. Such terms of sale imply conversion of QS units to the contemporaneous IFQ pounds-equivalent (a particular transaction may or may not include current-season permitted IFQ pounds). As such, the ‘QS price/IFQ Pound’ values shown in Table 3.30 are the average of observed selling prices for completed sales of crab QS, denominated in units under which such sales are commonly valued.¹⁴ Assuming competitive market conditions, variation over time in QS sale price is indicative of both the contemporaneous lease value of IFQ, and buyers’ expectations of future returns on the QS investment. The ‘IFQ/QS Price Ratio’ values reported in Table 3.30 provide an inverse index of contemporary expectations of QS buyers. In principle, holding IFQ lease price constant, increasing QS sale price reduces the value of the IFQ/QS price ratio, such that higher ratio values indicate low QS valuation at time of sale relative to contemporaneous ex-vessel market value.¹⁵

¹⁴QS price per IFQ pound values are comparable to current brokerage offers, for example: <https://dockstreetbrokers.com/crab-ifqs/crew-shares>).

¹⁵In principal, in a well-functioning competitive market, price per pound of IFQ reflects QS holders and fishermen’s expectations regarding the surplus to be produced from fishing the leased quota during the current season, taking account of uncertainty regarding factors that influence fishing costs and ex-vessel revenue. Similarly, QS sale prices reflect holder’s expectations for the surplus value of the fishery over time, defined as the present value of the stream of annual lease earnings for the indefinite future, where distant future expected lease revenues are ascribed a lower value

2.4.3 QS/PQS Holding

CR Program QS and PQS were initially issued to qualifying U.S. individuals and companies or other non-individual business entities based on historical participation in the CR fisheries. Over time, attrition of initial QS/PQS recipients and consolidation of quota holdings within a smaller pool of holders is anticipated as initial recipients exit the fishery and divest their financial interests in quota share and associated assets. Changes in the demographics of the quota holder population over time, concentration of quota shares, and/or other distributional outcomes, are important dimensions of the economic status of the fishery. In addition to monitoring attrition of initial recipients generally, of particular interest are the role of Western Alaska Community Development Quota (CDQ) groups in acquiring control of IFQ and IPQ program quota shares, and the degree to which individuals active in the fishery as on-board crew successfully acquire quota shares, either as new entrants, or by adding to existing holdings. The recent public announcement of the acquisition by Coastal Villages Region Fund and the Bristol Bay Economic Development Corporation of BBR and BSS QS holdings comprising 3% of the respective QS pools, and 7 crab vessels, from Seattle-based initial QS recipient Mariner Companies¹⁶, is representative of more general demographic trends in crab industry ownership structure.

Information on various dimensions of these processes is presented in Tables 3.32 to 3.39 of the report, and summarized in Figures 2.10 and 2.11. CR program rules limit the consolidation of vessel owner QS to a maximum share proportion of the quota share pool held by any single entity to 1% in BBR, BSS, EBT, and WBT fisheries, 2% in PIK and SMB, and 20% in EAG, WAG, and WAI fisheries, with “grandfathering” exceptions for initial issueses, and higher caps for crew share QS, CDQ groups, and non-individual PQS holders (see table below; use caps and related regulations are found at 50 CFR Part 680, at SS680.42). Under the rule, use of IFQ to catch and land crab by any one entity is subject to the similar caps, but an exemption for members of harvest cooperatives eliminates limitations on the consolidation of catch on vessels harvesting exclusively IFQ held by a cooperative.

(discounted) relative to near-term expected earnings. Implicit in the ratio of IFQ price to QS price is the average discount rate, r , such that

$$QS_{\text{price}} = \left(\frac{1}{r}\right) * IFQ_{\text{lease price}}$$

In this relation, the index $r = \frac{IFQ_{\text{lease price}}}{QS_{\text{price}}}$ reflects QS holders’ expected rate of return for holding QS, which in principal can provide an indicator of QS holders’ collective expectations regarding the rate of return for holding QS. Changes over time in this index can suggest changing expectations of future value of the fishery, e.g. a negative change in over time would indicate a reduced perceived risk of declining stock productivity, product prices, or other adverse management or market conditions. As a capital asset, the expected rate of return on QS is comparable to that of other investments of comparable risk, e.g. bond yields. As such, it is lower than the market rate, the holder could expect to earn more over time by selling the QS and investing in alternative assets.

¹⁶National Fisherman, January 7, 2021, *Bering Sea buyout: Western Alaska coalition now owns 3 percent of crab quota*

QS Use Caps As % Of Initial Quota Share Pool, by Holder Category and QS Type

Fishery	CDQ Group CVO/CPO	Non- individual PQS holder CVO/CPO	CVC/CPC	All other transferees CVO/CPO QS
BBR	5%	5%	2%	1%
BSS	5%	5%	2%	1%
EBT	5%	5%	2%	1%
WBT	5%	5%	2%	1%
PIK	10%	5%	4%	2%
SMB	10%	5%	4%	2%
EAG	20%	5%	20%	10%
WAG	20%	5%	20%	10%
WAI	20%	5%	20%	10%

Source: NMFS Alaska Region

The period of active transition of harvest quota share holdings that occurred in the initial two years of the program initially subsided, but market activity has continued to fluctuate interannually over subsequent years (Figure 2.10), indicating a level of ongoing turnover in QS pools. As indicated by the general metrics of QS pool status shown in Figure 2.11 and Tables 3.32 through 3.39, however, the overall structure and distribution of QS ownership has been relatively stable over the length of the CR Program, with minimal change over the most recent two seasons. In the BBR, BSS, EBT and WBT share pools and fisheries for both QS and PQS holdings, marginal reductions (2-5 fewer distinct QS holders) occurred between 2018/19 and 2019/20 in the Crew QS shareholder population across CR fisheries, with the largest change occurring in the BSS pool of a net reduction of 5 QS holders and median share holding increasing from 0.79% to 0.81% of the combined crew QS pool. Indices of Owner QS pools were largely unchanged between 2018/19 and 2019/20, the largest change occurring in the BSS pool, with 266 distinct QS entities increasing by 3 from the previous season, and by 25 from initial issuance, and median share holding declining from 0.36% at initial issuance to 0.25% in the most recent two seasons.

Across all fisheries, consolidation of crew share QS holdings during the first four years of the CR program produced a relatively large (-8%) initial decline from the total 224 individual CVC QS holders (Table 3.33), aggregated across all CR fisheries. Subsequent changes in the number of individuals moderated to a net value of 1-2 entries or exits per year through 2016/17 with a total of 201 individuals, but declining significantly over recent years, to 166 as of the end of the 2019/20 crab season. With respect to individual CFEC-permitted crab vessel operators active on-board crab vessels however,¹⁷ a gradual decline has continued in the numbers of individuals holding CVC and CPC shares, as well as in the percentages of the share pools held by them.¹⁸ CVC and CPC QS holders active as gear operators in one or more crab fishery have declined from 95 during the 2005/06 season to 58 as of the 2019/20 season, representing 35% of the 166 current individual CVC and CPC QS holders, and 43% of the aggregate pool of crew QS shares across all fisheries.

¹⁷Except for CFEC-permitted crab vessel operators identifiable in crab landings reports, no data are currently available to identify active participation status of crab fishing crew generally.

¹⁸Note that CVC shares are also held to some degree by active crab vessel crew members that do not hold CFEC gear operator permits. Most deck crew members hold ADF&G commercial crew licenses rather than CFEC permits, but only the CFEC permit of the vessel operator is recorded on landing reports. With currently available data, it is not possible to associate QS ownership with on-board crew status for individuals other than crab vessel masters.

Tables 3.34 and 3.35 report the change in regional distribution of Owner and Crew QS holdings, distinguishing between Alaska, Pacific Northwest (PNW; includes Oregon, Washington, and Idaho), and Other U.S., from initial issuance and in the two most recent seasons. The regional distribution of share holdings and number of individuals holding Crew QS s has shifted from PNW to Alaska residents, by 3% to 5% in the BBR, BSS, EBT/WBT, and SMB pools, with substantially fewer individual QS holders in both regions comprising the larger pools than at initial issuance. EAG and WAG crew QS began at 94% PNW held and is now 100% held by 9 PNW residents. Inter-regional changes in Owner QS pools has been more pronounced. Across all CR fisheries, the number of Owner QS holders and share of Owner QS pools held by residents of Alaska have increased relative to PNW-resident holders. In each of the respective BBR, BSS and EBT/WBT pools at initial issuance, 16% of the pool was held by some 40 Alaska residents, increasing to between 28% and 32% of the respective pools as of the two most recent seasons, and number of distinct Alaska resident QS holders increasing by 7 to 12; inversely, the 82% of each pool held by PNW residents at initial issuance declined by 12 to 17 percentage points as of 2018/19 and 2019/20. Similar regional shifts have occurred in EAG/WAG Owner QS pools, toward greater relative QS interests held by Alaska residents. Note that the metrics reported for Owner QS holdings include CVO and CPO QS acquired by CDQ groups, which account for a substantial fraction of the distributional change since initial issuance. As shown in Table 3.37, compared to less than 2% of respective Owner QS pools (other than EAG/WAG) held by CDQ groups at initial issuance, between 14% and 18% of the combined CVO/CPO QS pools in the BBR, BSS, and WBT/EBT pools is currently held by CDQ groups (this includes directly held QS and wholly-owned subsidiary QS entities, but excludes CDQ QS holdings through partial and/or indirect interest in other QS entities).

Tables 3.38 and 3.39 report statistics showing the progress of attrition of initial issuees and entry of new share holder individuals and entities in each of the respective CR fishery Owner (CPO and CVO) QS, Crew (CPC and CVC) QS, and PQS pools. Over all fisheries and sectors as of 2019/20, 212 out of 532 (40%) of initial issuees have exited from holding QS in one or more fisheries since 2005, of which 15 exited after the end of the 2017/18 season. Within individual quota pools, higher proportional rates of attrition have occurred, including approximately 45% of initial QS issuees exiting from each of the BBR, BSS, BST, and SMB fisheries.

Table 3.39 provides statistics on new entrants (i.e., not initial issuees) to respective QS/PQS pools in each fishery as of the end of the 2019/20 season, relative to initial issuance and to the end of the 2018/19 season. The table provides counts of new entrants and total share of the quota pool acquired, and differentiates entrants that were new to CR program holdings in general ("New crab entrant"), or only to the respective quota pool (i.e., where the entrant previously held quota in another fishery or sector ("New in fishery"). Relative to initial issuance, the most pronounced change in the proportion of QS pools held by new entrants is in the EAG owner and crew QS pools, with 44% and 58%, respectively, having been acquired by new entrants as of 2019/20, and the 53% of the PQS pool held by new entrants in the WAG fishery. The EAG fishery also saw the largest proportional transfer of QS number to new entrants between the 2018/19 and 2019/20 seasons, with 2 individual entrants acquiring 16% of the crew QS pool. Also notable was the acquisition of 9% of the WAI crew QS pool by one new entrant during 2019/20, the first such transfer since initial issuance. There were no new entrants to PQS pools during 2019/20.

2.4.4 Concentration of Catch Volume

The exemption from the use cap limitations on concentration of IFQ for vessels exclusively fishing IFQ held by CR program cooperatives is a critical element of the program that enables cooperatives to respond to resource and market conditions and shift the deployment and operation of vessels toward maximizing operating efficiency and economic surplus. The movement toward consolidation of 100% of IFQ landings within crab harvesting cooperatives, while consistent with the intention of the CR program, also obviates any structural limitation on concentration of IFQ landings within the fleet. To provide an index of concentration, the Gini coefficient is presented in Table 3.41, showing changes in concentration of IFQ landings across active vessels within the crab fleet, and the equivalent for crab purchasing across the set of active Registered Crab Receivers (crab buyers). As calculated¹⁹, the coefficient measures the relative evenness of the distribution of vessel-level total IFQ landings (or buyer-level total crab purchases) across the set of active vessels and buyers in a given crab fishery season. The index varies between 0 and 1, where 0 indicates equal quantity of pounds landed or purchased across all vessels/buyers, and 1 indicates complete concentration, with one vessel (buyer) landing (purchasing) all landed pounds.

With a heterogeneous fleet and highly variable operating environment, (hypothetical) perfectly even distribution of catch would not necessarily be economically optimal, *a priori*. However, a progression toward a more even distribution of catch may indicate incremental improvement in efficient utilization of vessel capital at the fleet level, whether achieved by means of capital improvements amongst a consistent set of active vessels, or consolidation and retirement of less efficient vessels. Table 3.41 displays Gini coefficient index values by calendar year for 1998-2019, with number of active vessels, total pounds landed and sold, average (median) pounds landed per vessel, and median percentage of total pounds landed, by fishery. In the BBR and BSS fisheries, the index has varied between 0.24 and 0.37, with the concentration of catch highest in the first rationalized season (2005 and 2007, respectively), and a recent increasing trend beginning in 2015 as TACs have declined and fleets have consolidated in response.

For purchasing of live-landed crab in the BBR fishery prior to the CR program (Table 3.42), concentration index values varied between 0.58 - 0.66, with the number of active buyers averaging 25 per year; following program implementation, index values have varied within a slightly lower range (0.54 - 0.61), with substantially fewer buyers (17 per season on average). In the BSS fishery, index values ranged 0.48 - 0.63 prior to 2006, and 0.42 - 0.53 subsequently, with the average number of buyers per season decreasing from 28 in 2000 to 12 in 2016. In both fisheries, there is some indication of less concentration of crab purchasing among the remaining pool of buyers following rationalization, but no discernible pattern of change in the period following rationalization analogous to that shown results for the harvesting sector. Note, however, that the counts of buyers shown in Table 3.42 includes those actively processing crab in their own plant as well as those that did not operate a plant at which they processed their own crab (i.e., buyers that solely contracted for custom processing of their purchased crab at one or more plants operated by other crab processors). As such, in contrast to the landings per vessel data shown in Table 3.41, the linkage to physical

¹⁹The index is calculated as $\frac{\sum_{i=1 \dots n} (2P_i - n - 1)x_i}{n^2 u}$ where P_i is the landings rank of vessel i , with landings of x_i pounds, such that the vessel with the highest landings is ranked 1 and the lowest is ranked n . Note that the number of active vessels n is generally decreasing over time, such that index values as calculated represent relative concentration among the set of active vessels in each crab fishery for each year. If calculated over a larger population that included inactive vessels with zero catch (not performed for this report), the index would indicate increasing concentration consistent with the overall consolidation of catch.

processing capacity is indirect in these results and possible inferences for relative efficiency in the processing sector are less clear.

2.5. Fishing Capacity, Effort, and Efficiency

General metrics of the gross capacity of physical and labor resources actively deployed in BSAI fisheries over the 1998-2019 period have been noted in a variety of contexts in the preceding discussion, including changes in size and composition of the active fleet (Table 3.3), as well as the number of individual crab vessel captains identified by CFEC permit number in crab landings records, and distinct crab buyers in the processing sector (Table 3.2). The substantial consolidation of fishing capacity following rationalization is clearly depicted in fleet composition (Figure 2.12), particularly in BBR and BSS fisheries where the total number of vessels operating in the BBR fishery ranged from a high of 274 vessels in 1998, to 89 during the first year of the CR program, and 241 vessels in the 1999 BSS fishery to 78 in 2006 (noting that 24 vessels were retired from the fishery in the capacity reduction program implemented in 2004).

In addition to general measures of deployed capacity, more granular indicators of applied fishing effort and productivity are provided in this report, including vessel trips, vessel days-at-sea (both days fishing and total days at sea) and, as a measure of effort at the gear level, pot lifts (analogous to hauls, in the case of groundfish trawl fisheries). Pro-rata indexing of ex-vessel volume and revenue by each of these provide additional indicators productivity by season, and changes in efficiency over time.

Table 3.18²⁰ depicts the total number of days during which vessels in the crab fleet were active at sea, which varies in response to a variety of conditions, including the quantity of allowable catch, but also weather and sea ice conditions affecting fishing. Most variation has occurred in the BBR and BSS fisheries, where there were an average 2,670 (2,611 for CV's and 52 for CPs) vessel days per season in the BBR fishery during the baseline reference years (1998, 2001, and 2004), and 626 vessel days during 2019, the lowest level in the time series. Active days in the BSS fishery have ranged from 6,570 averaged over pre-rationalization reference years (239 days for CPs and 6331 days for CVs), to 3,032 in 2010 (as reported in EDR data; CIF data indicate 2,812 days active during 2010, but both sources indicate a median of 41-42 active days per vessel). Days active in the 2019 BSS fishery declined marginally from 2018, by 59 days total, and 5 fewer days per vessel.

Table 3.43 provides a summary of trip statistics, including the total number of vessel-trips by fishery and season, average (mean and sd) of trips per vessel, and average volume of landings per trip.²¹ Crab vessels often make deliveries to multiple processors following a single fishing trip, and Table 3.43 provides the total number of deliveries per season, average deliveries per trip, and average landings volume per delivery. Statistics for vessel trips (total and mean per vessel) in the BBR fishery during the last 11 seasons have ranged from 237 total trips (3.0 per vessel) during the 2008/09 season to a

²⁰See notes for the table describing data sources available for calculating vessel activity days during different periods, which introduces a degree of discontinuity in counts of vessel activity days over the pre- and post 2008 period, and in statistics calculated using these data to estimate daily pro-rata rates for various indicators. Table 3.18 and Figure 2.13 display results using eLandings and ADF&G Crab observer program data to estimate vessel activity days; see the 2013 edition of the economic status report for a comparison of alternative data sources.

²¹Note that trip-based metrics in are available only for the 2006/07 crab season and later, with limited information available for EAG and WAG fisheries. Also note that BST results shown include landings of BST crab that are caught as bycatch in the BSS fishery and do not solely reflect directed fishing, and effort statistics shown should be interpreted accordingly.

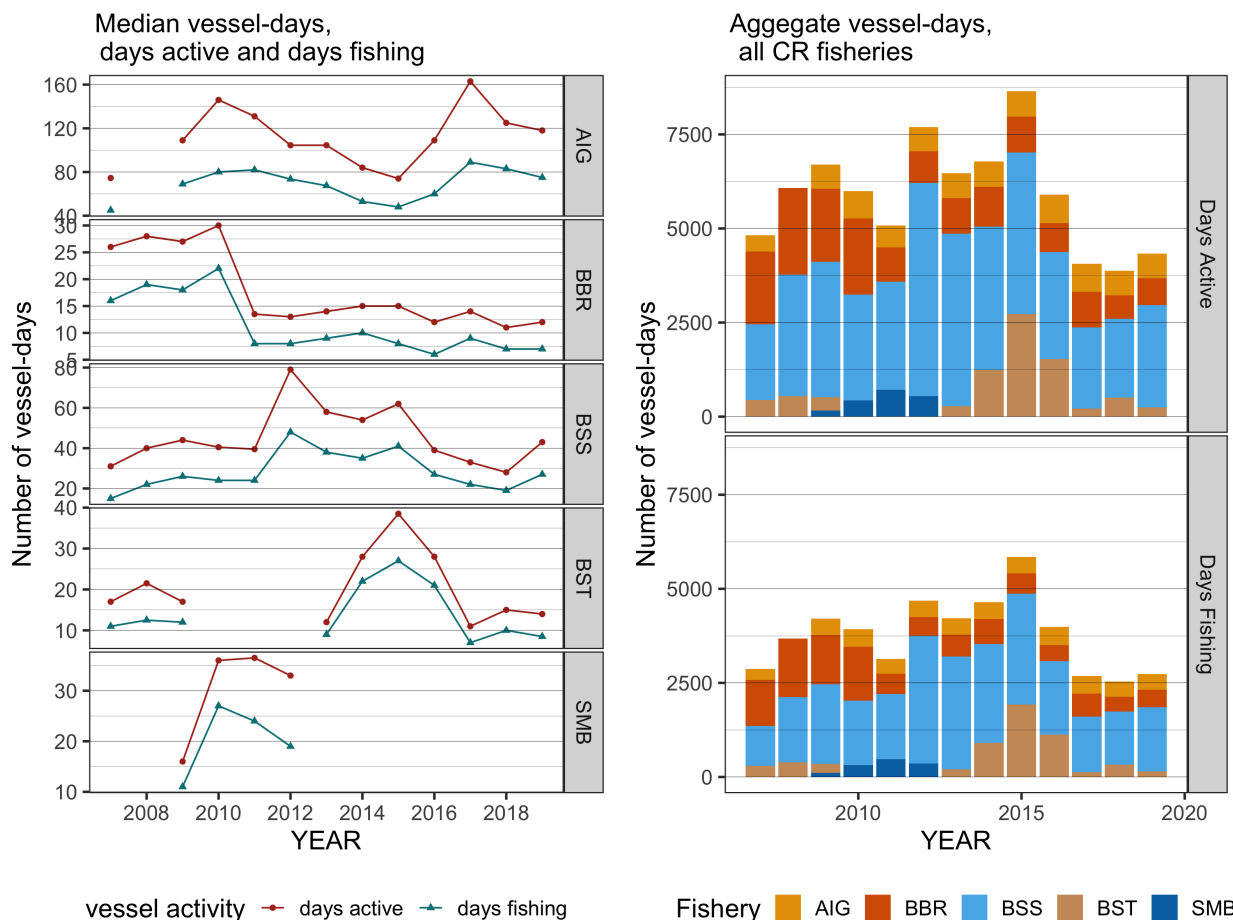

Figure 2.12: BSAI Crab Fishery Fleet Composition

Source: ADF&G fish tickets, eLandings. Tabular data available in Tables 3.2 and 3.3. Gaps in time series for BST, FIG, PIK, SMB, and WAI indicate fishery closure years. All crab fishery total (“ALL” panel in figure) represents counts of distinct vessels fishing in one or more crab fisheries during the year, not including the NSR fishery.

low of 101 total trips (1.8 per vessel) during the 2012/13 season. In the BSS fishery, as discussed previously, total catch has been considerably more volatile and vessel-trips counts have varied more widely, from 215 total trips (3.1 per vessel) in 2006/07, the lowest TAC year (37 million pounds) prior to 2019, to 636 total trips (9 per vessel) in 2011/12 when the TAC was 89 million pounds. Over this period, average landings per trip have varied between a high of 168 thousand pounds

Figure 2.13: Harvest Vessel Activity Days, Selected Fisheries

Source: ADF&G Shellfish Observer Program, Confidential Interview Form Data. Tabular data is presented in Table 3.18; the figure displays CIF vessel activity data only, from 2007 to 2019. Data for PIK and WAI fisheries not shown. Results for 2007 and 2008 show CV activity only, 2009-current shows activity aggregated over CV and CP sectors.

per trip in 2010/11 to a low of 111 thousand pounds per trip in 2018/19. Across all vessel activity metrics reported for the BSS in Table 3.43, 2019 was the least active year to date.

As a well-known result of rationalization, season lengths in the CR program fisheries increased sharply as management shifted from derby fishing conditions, with BBR season openings lasting as few as 4 days during the 2004/05 season, and 6 days in the 2005 BSS season, to quota-based management under which season lengths have expanded to the full regulatory seasons, as defined by State of Alaska as 93 days for BBR, 229 days for BSS, 274 for EAG/WAG, and 110 days for SMB (with extended seasons subject to approval as needed). Details for seasons 1998 through 2018/19 are displayed in Table 3.44, including season lengths in days, and the date-span of active seasons subsequent to rationalization, including dates of first and last vessel landings, number of days during the season that vessels were active, and percentage of the open season during which vessels actively prosecuted the fishery. The longest season in the BSS fishery occurred during 2011/12 at 245 days (extended due to sea ice conditions), with vessels actively fishing on 231 days (94% of the open season); the 95 active fishing days (42% of the open season) during the 2017/18 BSS fishery is the

lowest since pre-rationalization. The WAG fishery occurs over the longest season and active fishing period; 189 days of active fishing during 2010/11 is the lowest since rationalization, with 263 active days during the 2015/16 the longest active fishery. Table 3.44 provides additional detail for season length at the vessel-level, showing vessel averages for season length (days between first and last landing), and the minimum-maximum range, by fishery and season between 2005/06 and 2018/19 seasons.

Information on active season lengths as discussed above is shown for the BBR and BSS fisheries with additional detail in Tables 3.46 and 3.47 (summarized in Figure 2.14), depicting the length of fishing seasons (in terms of the period over which vessels delivered landings to processors), intensity of effort (number of vessels making landings in a week), and the cumulative proportion of total quota allocation landed by date, by allocation type (CVO A Class IFQ, CVO B Class and crew share IFQ, and all quota types combined). Since the 2011/12 BBR fishery, the fishery has been completed with all TAC landed between October 15 and November 12. The BSS season is more variable, given the late-season sea ice conditions that historically limited access to northern fishing grounds until April-May. As indicated in Figure 2.14) by the lines showing cumulative proportion of fishing quota allocations landed over the course of the fishing season by type of quota, a consistent phenomenon across fisheries and seasons is that CVO A share quota (dotted line) is fished and landed somewhat earlier in the season than quota types that are not subject to share matching with processors holding IPQ (CVO B- and crew share IFQ, shown as the dashed line). This difference is most in evidence during the 2011/12 season, when sea ice coverage delayed prosecution of the fishery, requiring an delayed closure of the fishery until June 15, as 93% of A-type IFQ had been landed as of the 26th week of the 35-week 2011/12 season, compared to 63% of B- and C-type IFQ. The 2019/20 BSS season was completed somewhat later than the previous four seasons, with 21% of total quota remaining to be landed as of the the 24th week of the season, compared to completion of all landings by the end of the 23rd week (March 18) in 2016/17 through 2018/19.

Finally, summary statistics for harvesting sector operating effort, measured as pot lifts per vessel are provided in Table 3.48 for all CR fishery seasons from 1998 to current, and BSS fisheries with derived productivity per-unit-effort metrics calculated as retained catch- and revenue-per pot lift. Statistics reported include total (aggregated over all vessels) and mean (sd) for pot lifts, and mean(sd) and weighted average per vessel for catch per unit effort (CPUE), and revenue per unit effort (RPUE). In the BBR fishery, total pot lifts are estimated at 48 thousand for 2018/19. Pot lifts per vessel prior to rationalization ranged from 300-600, increasing to 700-2000 per vessel after 2004 in response to fleet consolidation, but declining to 600-700 per vessel during the most recent two seasons. Vessel average CPUE in the BBR fishery ranged from 11.9 to 22.9 crabs per pot over the period 1998-2005, with an average over the period of 17.2 legal crab per pot; over the period 2005/06 to 2018/19, CPUE has ranged from 18.6 - 33.3, averaging 25.9 over the period, an increase of 51 percent over the pre-CR fishery average CPUE. Vessel average RPUE in the BBR fishery ranged from \$388 to \$1100 per pot lift during the pre-rationalization period (nominal dollars), compared to \$906 - \$2,022 subsequently. In the BSS fishery, total pot lifts have ranged from a high of 945,000 (3,900 per vessel) in 1999, to a low of 73,000 (400 per vessel) during the 2005 season, both occurring prior to CR implementation, with pot lifts per vessel averaging 1,300 over the period. Following rationalization, total pot lifts have ranged from 85 - 270 thousand, and per vessel have ranged from 1,200 to 3,700 and averaged 2,600 per vessel, a 100% increase. CPUE has increased from a range of 76-242 and an average of 143 legal crab per pot over the period 1998-2004, to 222-353 crabs per pot, increasing 83% to an average of 270 over the period 2005/06 to 2018/19. Vessel average RPUE ranged from \$178 to \$743 per pot lift during the pre-rationalization period, compared to \$445 - \$1,026 subsequently.

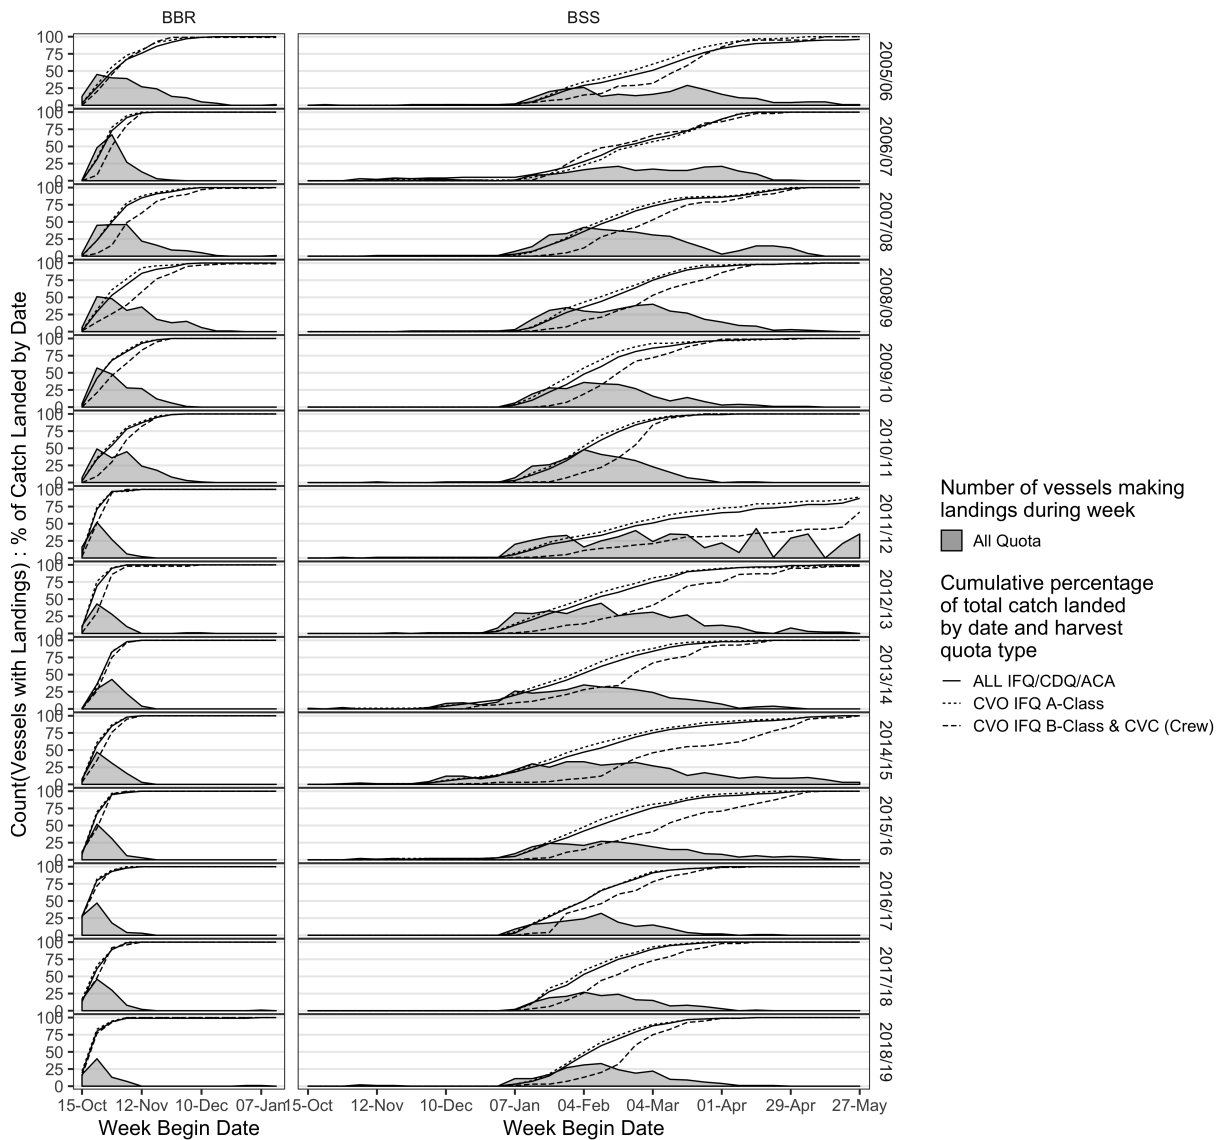

2.6. International Trade in Crab Commodities

U.S. foreign trade statistics for frozen, processed king and snow crab are summarized for the period 1991-2019 in Table 3.49 and depicted graphically in Figure 2.15. For most of the last two decades, the U.S. has been a net importer of both king and snow crab product, with a negative trade gap beginning in 1995 for king crab and 1998 for snow crab.

In 2019, the U.S. trade deficit in frozen snow crab product in terms of trade value reached a historical peak of \$725 million in net import value on 40 thousand t in net import volume. U.S. exports of frozen snow crab product since 2003 has varied from a recent peak in 2012 of \$144 million on 12.7 thousand t , to a recent low in 2018 at \$42.2 million on 2.5 thousand t .

The trade deficit in frozen king crab product continued the recent increasing trend since 2010, at \$351 million and 9.6 thousand metric tons (t) in net imports, and a record low in exports, at \$11.7 million in export value on 430 t .

Figure 2.14: Crab Vessel Landing Activity and Cumulative Catch, by Quota Share Class and Week of Season: Bristol Bay Red King and Bering Sea Snow Crab

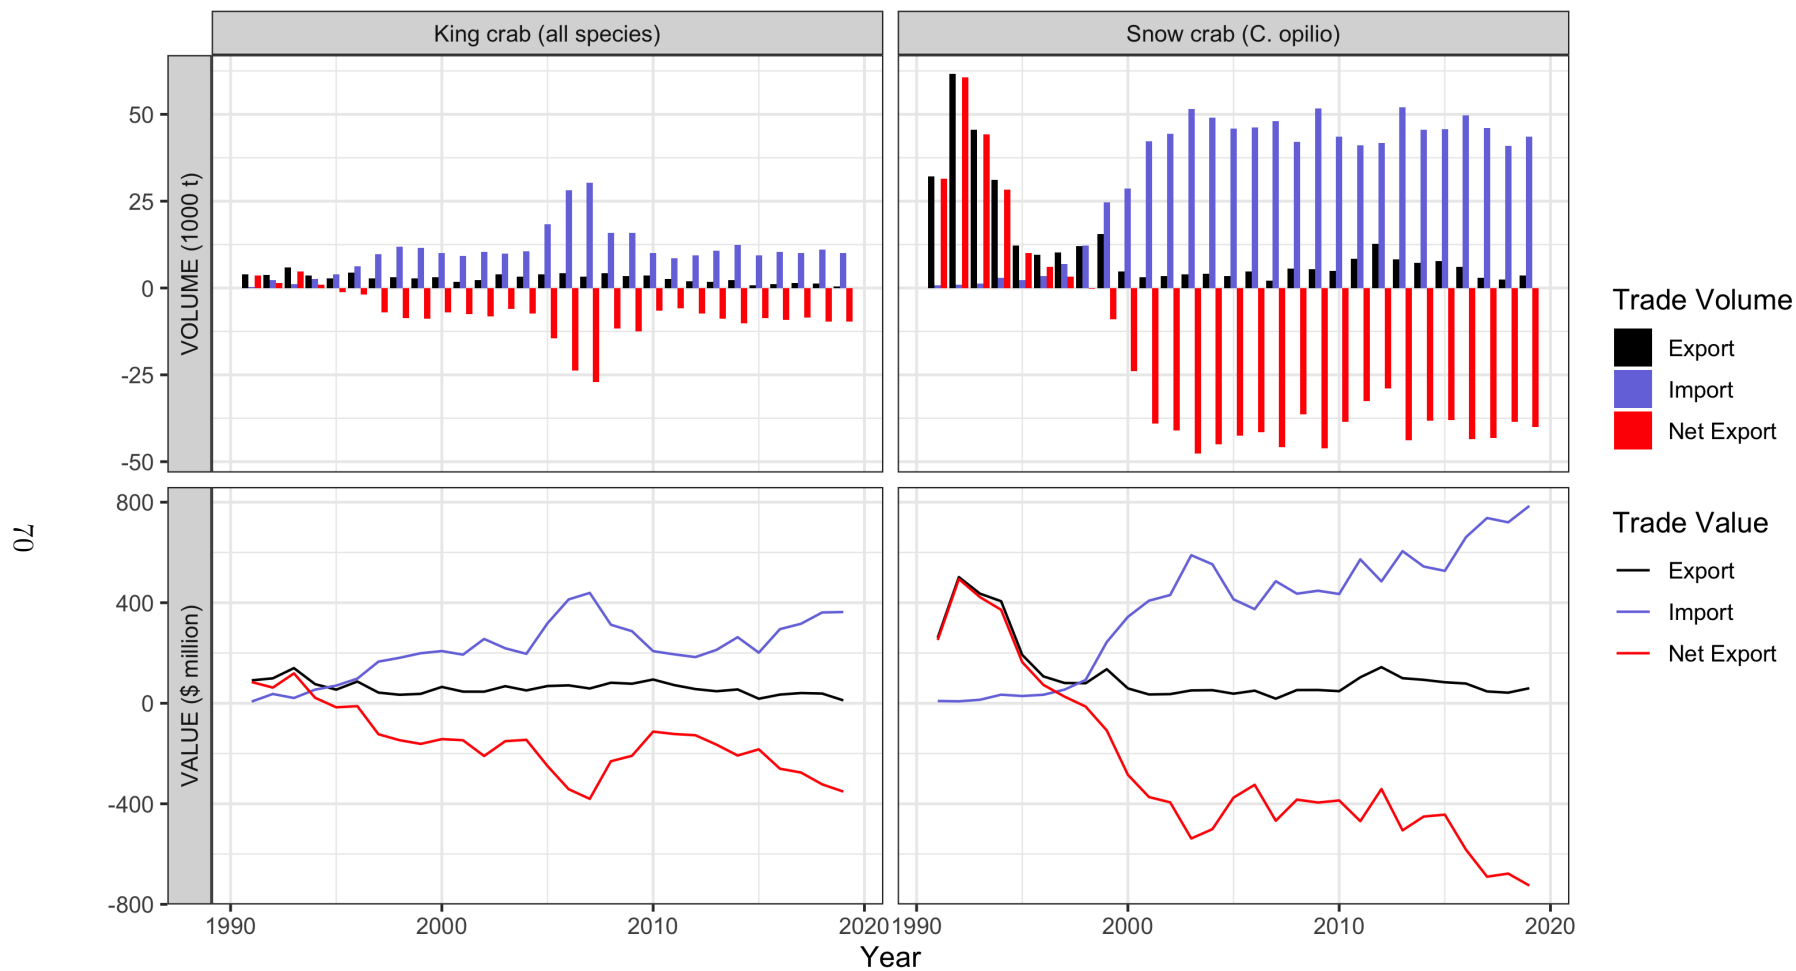

Source: *ADF&G fish tickets via eLandings; NMFS RAM Division, IFQ accounting database.* Tabular data available in Tables 3.46 and 3.47.

In the figure above, the plotted lines show cumulative percentage of fishing quota expended on landings over the course of the season, by quota type: ALL IFQ/CDQ/ACA includes all IFQ and CDQ programs quota landed by catcher vessels and catcher/processors; IFQ A-Class includes CVO A Class IFQ quota permits only; CVO IFQ B-Class & CVC (Crew) includes CVO B Class IFQ and CVC (crew) IFQ. The filled area in the graph indicates the count of vessels making landings each week. CDQ landings are not shown separately due to confidentiality restrictions. The vertical axis indicates count of vessels and percentage of quota share, both on a scale of 0-100, and the horizontal axis shows the end date of each week of the Bristol Bay red king (BBR) and Bering Seas snow (BSS) crab fishing season. BSS seasons normally open October 15 and close May 31 of the next calendar year; the 2011/12 BSS season was extended until June 15 due to an extended period of sea ice cover which substantially delayed prosecution of the fishery.

Figure 2.15: King and Snow Crab Exports and Imports by Calendar Year

King and Snow crab imports and exports, volume and value, 1991-2018

Source: U.S. Foreign Census Bureau Foreign Trade Division, via NMFS Fisheries Statistics Division, U.S. Foreign Trade Database. Data available at <http://www.st.nmfs.noaa.gov/st1/trade/>; Tabular data shown in figure available in Table 3.49. Trade value is inflation-adjusted to 2019-equivalent dollars using the GDP index. Imports and exports shown are for TSUSA product codes 306144010 (frozen king crab) and 306144020 (frozen snow crab).

Notes: Adak Community Allocation (ACA) applies to Western Aleutian Islands golden king crab fishery only. Values shown for the Norton Sound Red king crab fishery for 2005 through 2015 are for the summer commercial fishery only; prior to 2016, the winter commercial fishery was not managed with a GHL or TAC. General allocations and GHL apply to non-rationalized stocks (NSR and PIG). Data for PIK fishery (closed since 1999) and WAI fishery (closed since 2004/2005) are not shown.

Source: ADF&G (TAC and allocation amounts for all fisheries, usage for Norton Sound red king crab, Pribilof Islands golden king crab, and CDQ/ACA fisheries), and NMFS AKRO RAM division (IFQ usage).

Notes: Data shown by calendar year. Cells displaying '-' indicate fishery closure years. CFEC permits counts unique permits reported on ADF&F fish ticket crab landing reports; includes permits held by distinct crab vessel operators and additional permits required to fish CDQ/ACA allocation.

^a Data for Norton Sound red king crab are aggregated over the summer and winter commercial fisheries; as no vessels are used in the winter commercial fishery, the number of CFEC permits fished is a better measure of participation and effort for the combined fisheries.

^b Count of buyers/processors for Norton Sound red king crab excludes catcher seller operations.

^c Excludes participation in 2000/2001 and 2001/2002 Western Aleutian Islands red king crab Petrel Bank test fishery.

Notes: Data shown for all FMP crab fisheries by season; 'All CR Fisheries' shows counts of distinct vessels participating in one or more of the FMP fisheries that were rationalized beginning in 2005 (i.e., excluding NSR and PIG fisheries).

Vessel counts shown for the Norton Sound Red king (NSR) crab fishery for 1998 through 2015 include only vessels participating in the summer commercial fishery; 2016 and later counts include vessels in both summer and/or winter commercial fisheries ^a Excludes participation in 2000/2001 and 2001/2002 Western Aleutian Islands red king crab Petrel Bank test fishery.

Notes: Data shown for all BSAI crab fisheries by calendar year. Except where noted, data reflect total commercial volume and value across all management programs (LLP/open access, IFQ, CDQ, ACA) inclusive of all harvesting sector production (CV, CP, and catcher-sellers); approximation of ex-vessel sale value of CP and catcher-seller volume is incorporated in revenue total by using weighted average ex-vessel sale price. Price results are sourced from CV sector EDR data where available (1998, 2001, 2004, and 2005-current for CR program fisheries) and secondarily from CFEC gross earnings estimates (1999-2000, 2002-2003 for CR fisheries; all years for non-CR fisheries).

Weighted average price is calculated as the ratio of aggregate sales revenue to aggregate sold volume, and thus does not include a measure of distributional variation. Mean price results as shown are calculated as the arithmetic mean over price observations by vessel or processor (i.e., each price observation is weighted equally), with standard deviation (sd) reported to indicate relative variability over vessel-level observations, noting that large standard deviations are likely indicative of a non-symmetrical distribution.

^a Landings and ex-vessel revenue suppressed in years where CDQ fishery landings are confidential.

^b Excludes landings in Petrel Bank test fishery in 2001.

^c Data for Norton Sound red king crab are aggregated over the summer and winter commercial fisheries.

Source: ADF&G fish ticket data, eLandings, CFEC ex-vessel pricing, ADF&G Commercial Operator's Annual Report (COAR) data, NMFS AFSC BSAI Crab Economic Data Report (EDR) database.

Notes: See footnote on previous table regarding weighted and mean price. Data shown by calendar year for EDR reporting years 2005-present, and as three-year average over pre-rationalization reporting years (1998, 2001, and 2004, shown as '98/01/04'). Except where noted, data reflect total catcher-vessel sector commercial volume and revenue value across all management programs (LLP/open access, IFQ, CDQ, ACA). Beginning in 2012, data include ex-vessel sales reported by catcher/processor sector.

^a Landings in 2001 Petrel Bank test fishery; 1998 fishery data unavailable.

^b Vessels column shows total count of vessel-level observations for fishery-year; for 98/01/04, count of unique vessels represented over all observations in the 3-year data series is shown in parentheses. In a limited number of observations where there is missing data for either revenue or volume, average price for the fishery/year is used to impute the missing value.

Source: NMFS AFSC BSAI Crab Economic Data Report (EDR) database.

Notes: Except where noted, data reflect total catcher-vessel sector commercial volume and revenue value across all management programs (LLP/open access, IFQ, CDQ, ACA). Beginning in 2012, data include ex-vessel sales reported by catcher/processor sector. Weighted average price is calculated as the ratio of aggregate gross revenue value to sold volume, and thus does not include a measure of distributional variation. Mean price results as shown are calculated as the arithmetic mean over observations by vessel and quota share-type, with standard deviation (sd) reported to indicate relative variability over vessel-level observations.

^a Landings in 2001 Petrel Bank test fishery; 1998 fishery data unavailable.

^b Vessels column shows total count of vessel-level observations for fishery-year; in a limited number of observations where there is missing data for either revenue or volume, average price for the fishery/year is used to impute the missing value.

Source: NMFS AFSC BSAI Crab Economic Data Report (EDR) database.

Table 3.7: Estimated finished production, first wholesale value, and price, CR Program fisheries.

	Year	Processors	Finished weight (million lbs)	First wholesale value (\$million)	Weighted average price (\$/lb)	Mean(sd) price (\$/lb)

Notes: Data shown by calendar year. Weighted average price is calculated as the ratio of aggregate sales revenue to aggregate sold volume, and thus does not include a measure of distributional variation. Mean price results as shown are calculated as the arithmetic mean over price observations by vessel or processor (i.e., each price observation is weighted equally), with standard deviation (sd) reported to indicate relative variability over vessel-level observations, noting that large standard deviations are likely indicative of a non-symmetrical distribution. Counts of processors in Tables 3.9, 3.10, and 3.11 identify number of entities reporting crab production in the Commercial Operators Annual Report, including buyers of landed crab that employed custom processing services of other crab processors for all purchased crab; where noted, processor counts in other tables show the number of active crab processing plants exclusive of custom-only buyers. For 1998-2005 wholesale value is estimated by multiplying the yearly estimated wholesale production volume with the annual weighted first wholesale value per lb., by species, derived from COAR production reports for processors reporting processing in the given fishery and year. Wholesale value and prices for 2006 and later are estimated by applying prices derived from EDR crab sales data to yearly estimates of wholesale production volume. Note that crab sales reported in the EDR may reflect sales from prior-year inventory. For 1998-2005 and 2012 and later, wholesale production volume is estimated by multiplying the volume of ex-vessel commercial landings reported in fish tickets to the 1998-2005 or, for 2012 and later, 2007-2011 mean product recovery rate calculated from COAR production and buying reports for processors reporting landings ≥ 1000 lbs. in the relevant BSAI crab fishery. Annual production volume for 2006-2011 is sourced from EDR data.

^aExcludes estimates of production from landings made in the 2000/2001 and 2001/2002 Western Aleutian Islands red king crab Petrel Bank test fishery.

Source: ADF&G fish ticket data, eLandings, ADF&G Commercial Operator's Annual Report (COAR) data, NMFS AFSC BSAI Crab Economic Data Report (EDR) database.

Notes: Data shown by calendar year. Includes processing of crab taken from stocks/fisheries other than those managed under the BSAI crab FMP. Counts of processors in Tables 3.9, 3.10, and 3.11 identify number of entities reporting crab production in the Commercial Operators Annual Report, including buyers of landed crab that employed custom processing services of other crab processors for all purchased crab; where noted, processor counts in other tables show the number of active crab processing plants exclusive of custom-only buyers.

Source: ADF&G Commercial Operator's Annual Report (COAR) data.

Table 3.10: Continued

		Year	Processors	Processing labor hours			Labor Payments (\$1,000)		Processing wages, median (\$)	
				Total (1,000)	Median per plant (1,000)	Median per 1000 pounds (raw)	Total	Median per plant	per hour	per 1000 pounds (raw)
WAI	CP	98/01/04	2(1)	-	-	-	*	*	-	*
	SF	98/01/04	1(1)	*	*	*	*	*	*	*

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

Processing labor hours reflect hourly processing line workers employed by shoreside and floating processor sectors only; excludes salaried workers employed in the processing sectors (see Table 3.11). Processing labor payments exclude benefits and indirect expenses paid on behalf of processing workers and payments to salaried workers employed by processors (see Table 3.11). Where applicable, these figures include bonuses and deductions to labor payments for shared expenses such as food and provisions. Median pay per hour values are inclusive of, and representative of, the shoreside and floating processor sectors only.

Pro rata statistics estimating processing labor hours per 1000 pounds and labor cost per 1000 pounds use the summed value of raw crab purchased and raw pounds custom processed for other buyers reported by shoreside and floating processing plants (excluding CPs) in EDR data; previous editions of this report used finished pounds as the per-pound pro rata factor, but collection of finished pounds in EDRs was discontinued beginning in 2012.

For 2009 to current, results are summarized over all processing sectors (SF & CP) to preserve confidentiality. For the baseline period through 2008, results are shown by processing sector, with CP denoting the catcher-processor sector and SF denoting shore-based processors (shore-plants and stationary floating processors)

Statistics for pre-rationalization base years are calculated as the annual average over the 1998, 2001, and 2004 calendar years, and the Processors column shows the number of unique data records and unique processors (in parentheses) for the period.

Calculation of average prices and pro-rata statistics censors observations where the observation-level calculated value is outside two standard deviations of the group mean.

2019	7	1,488	215	\$64,358	\$8,362	\$49	

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

Results shown above summarize data reported by processors for number of employees and gross cost of salary and wages paid for non-processing positions at the processing facility (including foremen, managers, administrative, and other personnel not primarily employed as processing line laborers); wage costs include salary, hourly wages, and bonuses paid to employees, and exclude non-wage benefits, payroll taxes, and other employment costs.

Statistics for pre-rationalization base years are calculated as the annual average over the 1998, 2001, and 2004 calendar years, and the Processors column shows the number of unique data records and unique processors (in parentheses) for the period.

Due to changes in Crab EDR data collection beginning in 2012, reporting of this data was discontinued for the CP sector, and employment and salary data after 2012 represents total annual value over all production and sales activities, including but not exclusively crab production. Prior to 2012, employment and salary values are specific to BSAI crab production and are not directly comparable to values reported for 2012 and later.

Calculation of average prices and pro-rata statistics censors observations where the observation-level calculated value is outside two standard deviations of the group mean.

WAI	CP	98/01/04	2(1)	-	-	-
	CV	98/01/04	3(3)	*	*	*

Notes: Data shown by calendar year; statistics shown for 98/01/04 are calculated over the 1998, 2001, and 2004 calendar years, with vessel column indicating count of vessel-level observations, and unique vessels (in parentheses) over the 3-year period. Starting in 2009, data are summarized over all harvesting sectors (CVCP) to preserve confidentiality.

Total count and mean per vessel statistics by fishery/sector/year are shown for crew positions in the active fleet and unique crew members receiving payment for crab fishing; statistics include fishing crew and captain, excludes processing-only employees on CPs.

Crew positions statistics are calculated using average fishing crew size reported in EDR data for 1998/04/05 (data not collected for CPs). As of 2005 calendar years (2006 for BSS fishery), crew positions are calculated using eLandings data on count of crew on-board reported by trip. CP crew positions statistics are inclusive of processing crew, as reported in the EDR and/or eLandings.

Crew participant statistics published prior to 2013 used EDR data on number of crew receiving pay settlements for each crab fishery, but was discontinued in the EDR beginning in 2012 - see earlier editions of this report for by-fishery crab crew participant statistics for 1998 through 2012.

^a No catcher/processor operations reported fishing activity in the SMB fishery from 2009 to 2012.

^b 2001 WAI fishery was closed except for Petrel Bank test fishery.

^c As elsewhere in this document, data for EAG and WAG fisheries are summarized in aggregate for Aleutian Islands golden king crab (AIG) fishery to preserve confidentiality; where vessel crew data are reported for both the EAG and WAG fisheries, mean figures over the two fisheries for crew participants and crew positions were used in place of cumulative figures under the assumption that the same individuals are employed in both fisheries.

Source: NMFS AFSC BSAI Crab Economic Data Report (EDR) database, 2005 and later crew positions information from eLandings.

Table 3.14: Alaska residency of participating licensed crew members and gear operators, CR Program fisheries

Notes: Data shown by calendar year. A commercial crewmember license or CFEC Gear Operator permit is required of any individual participating directly or indirectly in taking of raw fishery products on a commercial vessel, including cooks, engineers, and individuals handling fishing gear or involved in maintenance or operation of the vessel; processing line workers on catcher-processors are not required to hold licenses, however the counts above may include crab CP processing line workers that held commercial crew licenses but did not work as fishing crew.

^a Note that crew license and gear operator permit number reporting in EDR data was likely incomplete for 2005 and 2006, but is largely accurate for 2007 and subsequent years due to improvements in EDR administration implemented by the NMFS EDR data collection agent (PSMFC), including providing lookup support to EDR submitters and online access to crew license and gear operator permit registries.

Source: ADF&G commercial crewmember license files, , ADF&G fish ticket data, eLandings, and NMFS AFSC BSAI Crab Economic Data Report (EDR) database.

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value.

Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

Statistics shown for 98/01/04 are calculated over the 1998, 2001, and 2004 calendar years, with vessel obs. indicating total vessel-level observations, and unique vessels (in parentheses) over the 3-year period. Starting in 2009, data are summarized over all harvesting sectors (CVCP) to preserve confidentiality.

Crew and captain share payment statistics show total aggregate and vessel-level median payment by fishery/sector/year. Share payment reflects amount paid for harvesting labor and includes post-season adjustments, bonuses, and deductions for shared expenses such as fuel, bait, and food and provisions, where applicable; excludes any royalty or capital-rent payments for IFQ or vessel ownership share held by captain or crew members.

Crab-equivalent crew pay represents crew share payment value in terms of pounds of landed crab, which normalizes over year-to-year changes in ex-vessel price; calculated for catcher vessels (excludes catcher/processor sector, which do not report ex-vessel landings or revenue) by dividing vessel crew share payment by the vessel-specific average ex-vessel price per pound (ex-vessel revenue/landed pounds).

^a No catcher/processor operations reported fishing activity in the SMB fishery from 2009 to 2012.

^b 2001 WAI fishery was closed except for Petrel Bank test fishery.

Notes: Data shown by calendar year. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”. Results exclude crab CPs and are shown for crab CVs only. Net revenue share percentages are estimated as the median value over vessel-level net share percentages reported in EDR data from 1998-2011, and represent crew and captain percentages of ex-vessel revenue after deductions for vessel operating expenses and crew-related costs, by crab fishery (for 1998/2001/2004, netshare percentage was reported in aggregate over all vessel labor (captain and crew) and over all crab fisheries). Net revenue share reporting for all sectors was discontinued in the EDR beginning in 2012. Gross revenue share percentages are estimated as median vessel-level values of crew and captain labor payments as a percentage of gross ex-vessel value, before deductions for vessel operating expenses and payments to harvest quota share-holders.

Notes: Data shown by calendar year. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

Statistics shown for 98/01/04 are calculated as the annual average over the 1998, 2001, and 2004 calendar years; 'Vessels' for 98/01/04 shows count of vessels operating each year, summed over all years; numbers in parentheses show count of unique vessels participating within the three years. Total statistics for Days Active and Days Fishing columns for 98/01/04 shows total aggregate count of vessel activity days averaged across years for participating/reporting vessels. Starting in 2009, data are summarized over all harvesting sectors (CVCP) to preserve confidentiality.

Days active and days fishing are shown as calculated from EDR reporting (1998-2011 for days active, 2005-2011 for days fishing) and ADF&G Shellfish Observer Program confidential interview form data (CIF) supplemented with eLandings data (2009 and later). EDR days active by fishery is calculated using reported days at sea in the 1998-2004 data and, for 2005 and later, the sum of days fishing and days travelling and offloading (vessel activity was not reported by days fishing and traveling/offloading in the 1998-2004 EDR). Note that the 1998-2004 and 2005 and later figures for both total and median days active are not directly comparable, as the pre-2005 data do not include days spent queuing and offloading at processors.

^a 2001 WAI data reflect activity in Petrel Bank test fishery.

Notes: Bering Sea Tanner crab managed as a single fishery in 2005/2006 and as Eastern and Western fisheries in subsequent seasons. Eastern area closed as an in-season management measure in 2005/2006. Count of quota holding entities in the baseline, 2005/2006 and 2006/2007 seasons represent holders of Bering Sea Tanner quota; subsequent seasons show count of distinct holders of Eastern or Western quota.

^a Beginning in 2012, vessel food and provisions expenses are reported on a by-fishery basis. Collection of processing employee provisions costs paid by shoreside processors was discontinued after 2011; see earlier volumes of this report for processing plant provisions costs for 1998 through 2011.

Notes: Data shown by calendar year. Statistics shown for 98/01/04 are calculated as the annual average over the 1998, 2001, and 2004 calendar years; Vessels column for 98/01/04 shows count of vessels operating each year, summed over all years; numbers in parentheses show count of unique vessels participating within the three years. Starting in 2009, data are reported over all harvesting sectors (CVCP) to preserve confidentiality. Totals for 98/01/04 represent total annual bait pounds purchased or bait costs averaged across years with participating/reporting vessels. Changes in the reporting of bait quantity and costs in the EDR limit the comparability of bait statistics over the available time series. Beginning in 2006, EDR submitters were directed to report only pounds and costs of bait purchased during the reporting year; treatment of bait caught by the vessel or purchased in the prior year was not specified in EDR reporting instructions for 2005 and earlier years. Additionally, bait quantity reporting is differentiated by species and fishery in all years of EDR data collection, whereas bait costs are reported only by fishery for the years 1998-2004 and by fishery and species together for 2005 and later years. Methods for generating price per pound statistics differs across reporting years. For 1998 - 2004 statistics, reported bait quantities are aggregated by submitter and fishery to match reported bait costs; 2005 and later bait price statistics reflect the exclusion of quantity-cost observations that indicate zero or no reported costs, as well as of observations where the quantity of bait is less than 100 pounds. Bait quantity reporting was dropped from the EDR beginning in 2012. a No catcher/processor operations reported fishing activity in the SMB fishery from 2009 to 2012.

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

Cost and revenue values are shown in \$1000. Vessel-level mean monetary and percentage statistics are calculated across all included vessels. Data reflect total commercial volume and value across all management programs (LLP/open access, IFQ, CDQ, ACA) inclusive of all harvesting sector production; approximation of ex-vessel sale value of CP and catcher-seller volume is incorporated in revenue total by multiplying volume of retained catch by the weighted average ex-vessel sale price sourced from CV sector EDR data. Note that cost information reported in the crab EDR data collection program is limited; vessel operating (i.e., variable) costs are not comprehensive, and fixed cost and capital expenditures are not collected. As a result, cost and revenue residual aggregates shown in table represent partial indices of costs and net earnings, and estimated gross profit from represent upper bound approximations of gross profit. This value does not take into account fixed, overhead, finance/interest, and associated costs and is not a measure of vessel-level net profit.

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”.

Cost and revenue values are shown in \$ million. Fleet-level monetary and percentage statistics are calculated across all included vessels. Data reflect total commercial volume and value across all management programs (LLP/open access, IFQ, CDQ, ACA) inclusive of all harvesting sector production; approximation of ex-vessel sale value of CP and catcher-seller volume is incorporated in revenue total by multiplying volume of retained catch by the weighted average ex-vessel sale price sourced from CV sector EDR data. Note that cost information reported in the crab EDR data collection program is limited; vessel operating (i.e., variable) costs are not comprehensive, and fixed cost and capital expenditures are entirely excluded. As a result, cost and revenue residual aggregates shown in table represent partial indices of costs and net earnings, and estimated gross profit from represent upper bound approximations of gross profit. This value does not take into account fixed, overhead, finance/interest, and associated costs and is not a complete measure of net income or economic profit.

^a Residual percentages are vessel and QS sector share of gross ex-vessel profit; all other percentages are cost shares or residuals with respect to gross revenue.

Notes: Other fishery data is not shown due to insufficient observations. Lease data shown represent “market-rate and/or negotiated price” lease transactions as reported for active crab fishing vessels in the 2012 through 2019 Crab EDR, which includes both true arm’s length transactions as well as transfers between related parties at market-rate value. Harvest quota types are categorized in this report as the following: CVO A (catcher vessel owner Class A IFQ), CVO B + CPO (catcher vessel owner Class B IFQ and catcher/processor owner IFQ), and CVC + CPC (catcher vessel crew IFQ and catcher/processor crew IFQ). Statistics reported represent results pooled over all quota types and/or regional designations within each category. ^a Vessels column shows total count by year and quota type of vessels reporting pounds of the quota type leased; the count for “All Quota” shows the number of vessels reporting pounds leased for one or more quota types, and excludes vessels active for the year that did not report lease data for any quota type.

^b Lease rate statistics for each quota type are calculated with respect to ex-vessel value of crab sold using the same quota type, calculated as the ratio of lease price to ex-vessel price over all observations where both ex-vessel and lease pounds, and ex-vessel revenue and lease cost were reported as non-zero values. Median lease rates are calculated over observation-level lease/ex-vessel ratios by quota type, and weighted mean values are weighted by observation-level pounds. “All Quota” lease rates are calculated over observations where by-quota type quantities are summed over all quota types at the vessel level, such that the weighted average is weighted by total pounds leased at the vessel-level.

^c Weighted mean statistics reported for “Lease pounds as % of pounds landed”, and “Lease cost as % of ex-vessel gross” are calculated over all observations where both ex-vessel and lease pounds, and ex-vessel revenue and lease cost were reported as non-zero values. By-quota type values are reported with respect to the percentage of aggregated ex-vessel pounds and revenue landed by vessels reporting non-zero lease values for that quota type, not the total ex-vessel volume and value of all landings of that quota type across the fleet.

2015/16	255	-	86	-	55
2016/17	172	-	140	-	28
2017/18	215	-	243	5	31
2018/19	252	-	128	3	50
2019/20	191	-	167	-	38

Notes: Counts of Cooperative and Non-cooperative lease transfers represent the number of distinct transfers completed through submission of an Application for Transfer of IFQ Between Fishing Cooperatives and Application for Transfer (Lease) of Crab IFQ forms, respectively; each individual transfer of IFQ pounds in a given crab fishery (e.g., BBR, BSS) between one IFQ permit/entity and another IFQ permit/entity identified in submitted forms is counted separately, and counts are aggregated over all crab fisheries for a given crab year. IFQ leasing (or other transfer arrangements) between crab harvest cooperative members within a cooperative are not subject to reporting to NMFS and are not included in these counts.

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”. The counts of transfers reported in the first column represent the number of distinct bi-lateral transfers for which transfer applications were submitted to RAM by QS holders; counts of transferors represents the number of distinct QS holders submitting applications to sell QS shares, and transferees identifies the number of distinct entities receiving transfers.

Notes: Data shown for all CR program crab fisheries by calendar year. All dollar values are adjusted for inflation to 2018-equivalent value. Information suppressed for confidentiality where indicated by “*”, and data not available where indicated by “-”. Average price/QS unit is calculated as the median price of quota share sales as reported by QS transfer applicants to NMFS AKRO RAM division; Ratio of QS units/IFQ pounds is the season-specific conversion factor used by RAM in determining annual IFQ issuance in pounds per QS share; QS Price/IFQ Pound is the ratio of the preceding quotients, used to convert the QS price from price/QS unit to price/IFQ pound, to facilitate comparison of QS price to IFQ price on the same per-unit basis.

Notes: Statistics shown for Crew QS and Owner QS report combined crab catcher vessel and catcher/processor crew (CVC and CPC) QS, and combined (CVO and CPO) quota share pools, including the number of distinct persons directly holding QS (number of individual persons directly holding crew QS, and number of persons directly holding owner QS including both individual persons and non-individual entities), and the median and maximum percentage of QS pool shares held amongst distinct entities in the pool. Owner QS statistics include QS held by CDQ groups and wholly owned direct subsidiaries of CDQ groups. Initial allocation reports the status of the quota pool as of the beginning of the 2005/06 crab season; statistics shown for the two most recent crab seasons reports the status of the QS pool as of the end of the respective season.

Initial issues received QS for the first crab season under the CR program, 2005/06. In the Tanner crab fishery, BST quota was initially issued, and the pool was subsequently split into Eastern and Western BST quota (EBT, WBT); statistics shown for Initial allocation for EBT and WBT are identical and represent the same pool, while statistics for subsequent periods are calculated separately for the distinct Eastern and Western fisheries.

Notes: Statistics shown by CP and CV sector-class for Crew QS (CPC and CVC) and Owner QS (CPO and CVO) report the number of distinct QS holders (entities or individuals), and the median and maximum percentage of QS pool shares held amongst distinct entities in the pool. Owner QS statistics include QS held by CDQ groups and wholly owned direct subsidiaries of CDQ groups. Initial allocation reports the status of the quota pool as of the beginning of the 2005/06 crab season; statistics shown for the two most recent crab seasons reports the status of the QS pool as of the end of the respective season.

Notes:

Initial issuance shows the number of initial Crab QS/PQS recipients in each of the respective quota pools as of the beginning of the 2005/06 crab season; counts for the most recent seasons show the current number and net change (exit) in the number of initial issuees in the respective pool remaining as of the end of the two most recent crab seasons.

Quota initially issued for the Bering Sea Tanner crab (BST) was reissued for the 2006/07 season corresponding to division of the fishery into eastern and Western management units (EBT, WBT). The table reports initial BST quota holders as of 2005, and initial EBT and WBT holders as of 2006; net change from initial issuees remaining reported for EBT and WBT is relative to 2006.

Notes: Excludes harvest from CDQ programs. A landing is an offload by a vessel to a registered crab receiver, and includes at sea landings on catcher/processors and stationary floating processors. A fishing cooperative and its members are counted as a single IFQ permit holder.

Source: NMFS AKRO RAM division Quota Share and Processor Quota Share holder files and IFQ accounting database.

WAI	2002	33	0.50	14.29	2.85%	0.30
	2003	30	0.48	13.18	2.77%	0.31

Notes: Data shown by calendar year. Includes harvest from CDQ and IFQ fisheries and pre-rationalization general access fisheries, as well as landings and harvest made on catcher/processors.

The Gini coefficient measures the relative evenness of the distribution of vessel-level total IFQ landings across the set of active vessels in a given crab fishery season. The index varies between 0 and 1, with higher values indicating greater relative concentration of catch; see section 2.4.4 for discussion of Gini coefficient results shown in the table.

Notes: Data shown by calendar year. Includes purchased crab landings from CDQ and IFQ fisheries and pre-rationalization general access fisheries. Landings/harvest made by and self-processed by catcher/processers are treated as purchases, with catcher/processers counted as buyers.

Buyers include catcher/processers landing and processing their own crab.

The Gini coefficient measures the relative evenness of the distribution of catch purchasing across the set of active buyers in a given crab fishery season. The index varies between 0 and 1, with higher values indicating greater relative concentration of purchasing; see section 2.4.4 for discussion of Gini coefficient results shown in the table.

Notes: A delivery is counted as each unique day that a vessel landed crab and may include landings to multiple processors; a single fishing trip may result in multiple deliveries if crab was landed on multiple days. Includes landings on and by catcher/processors. Trip accounting data unavailable prior to 2006/2007 season.

Notes: Days fished is calculated as the difference between latest and earliest landing dates during a given season. Percent of season fished is calculated as days fished divided by season length. In some fishery seasons, deliveries made were after the season closing date. Includes landings made on catcher/processors.

^a 2011/2012 Bering Sea Snow crab fishery season extended past regular season closing date (May 31) due to sea ice coverage.

Source: Season dates and season length from ADF&G. Earliest and latest landing dates in 2005/2006 and later seasons from NMFS AKRO RAM division IFQ accounting.

Notes: Te BBR fishery season is open by regulation from October 15 to January 15. Cumulative proportion of pounds landed indicates total of a) combined IFQ and CDQ sold pounds, including catcher/processor landings (“All”); b) sold pounds landed on catcher vessel owner A-type IFQ permits (CVOA); and c) sold pounds landed on catcher vessel owner B-type IFQ permits or catcher vessel crew type IFQ permits (CVOB + CVC). CVOA IFQ permits are subject to matching to processing quota, whereas CVC and CVOB may be landed at any processor.

Notes: Effort statistics for the most recent crab year shown in the table represent fishing activity occurring during the early part of the season, before December 31. CPUE = number of legal crab per potlift; RPUE = ex-vessel value of commercially sold crab per potlift. Dollars are inflation-adjusted to 2019 -equivalent value using the GDP deflator. Includes catcher/processor harvest and effort.

Notes: The Personal Consumption Expenditures (PCE) chain-type price index is used where noted in this report to deflate estimates of ex-vessel revenues, fishing costs, crew earnings, and associated monetary values to account for price inflation in US general personal consumption expenditures. The Gross Domestic Production (GDP) chain-type price index is used where noted to deflate estimates of wholesale production revenues and production costs to account for change in the general price level of US domestic production of all goods and services.
