# 2020 BSAI Pacific ocean perch Assessment

Paul Spencer and Jim Ianelli

Alaska Fisheries Science Center

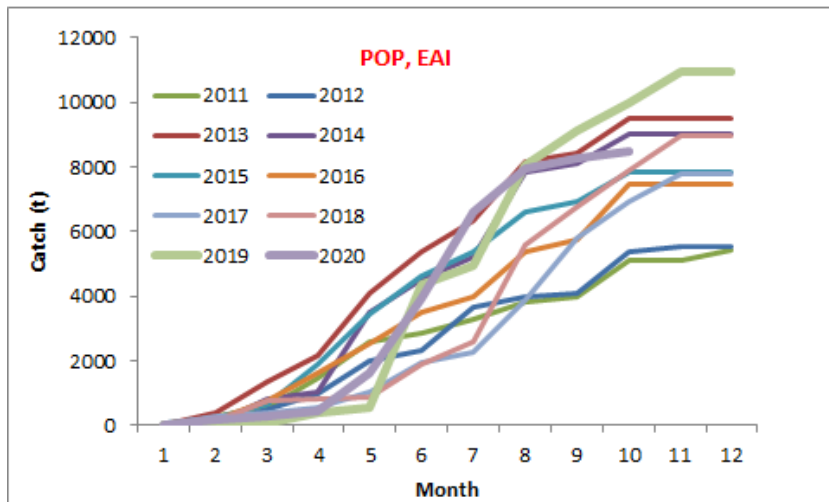

# Overall summary

- No modeling changes.
- Recent high survey biomass estimates have been keeping model-estimated biomass high, but stock had been on a downward trend. Without a 2020 survey, the biomass and ABC are even lower.
- Slight change in fishery selectivity curve results in lower  $F_{spr}$  rates.
- 2021 ABC of 37,173 t (24% decrease from 2020 ABC).
- Assessment-related concerns noted in risk table.

# BSAI POP Outline

- 1) Catch information
- 2) Survey and fishery data
- 3) Model description, fits to data
- 4) Retrospective analysis
- 5) Sensitivity runs
- 7) Risk table
- 8) Management recommendations

# BSAI POP catch by month and area, 2011-2020

# Economic performance report

	2010-2014 Average	2015	2016	2017	2018	2019
Total catch K mt	30.16	39.7	36.9	38.4	42	54.7
Retained catch K mt	27.1	37.5	35.3	35.5	38.8	49.8
Pac. Ocn. perch share of retained	88%	80%	86%	85%	84%	80%
Northern share of retained	8%	18%	12%	12%	13%	17%
Vessels #	21.6	21	21	19	24	26
First-wholesale production K mt	14.7	19.4	17.6	17.4	19.4	24.0
First-wholesale value M US\$	\$42.0	\$42.8	\$34.6	\$41.1	\$43.3	\$42.5
First-wholesale price/lb US\$	\$1.29	\$1.00	\$0.89	\$1.07	\$1.01	\$0.80

2018	7,828	1,488	16	24,617	497	2	32,446	1,985	6
2019	11,211	2,811	20	28,592	505	2	39,803	3,315	8
2020	3,974	2,323	37	25,848	448	2	29,822	2,771	9

# Data in assessment model

Component	BSAI
Fishery catch	1960- <b>2020</b>
Fishery age composition	1981-82, 1990, 1998, 2000-2009, 2011, 2013, 2015, 2017, <b>2019</b>
Fishery size composition	1964-72, 1983-1984, 1987-1989, 1991-1997, 1999, 2010, 2012, 2014, 2016, <b>2018</b>
AI Survey age composition	1991, 1994, 1997, 2000, 2002, 2004, 2006,2010,2012,2014,2016, <b>2018</b>
AI Survey biomass estimates	1991, 1994, 1997, 2000, 2002, 2004, 2006, 2010, 2012, 2014, 2016, 2018
EBS Survey age composition	2002,2004,2008,2010,2012,2016
EBS Survey biomass estimates	2002,2004,2008,2010,2012,2016

# Model description

- Model 16.3a from the 2018 assessment, with updated data, estimated length-at-age, weight-at-age, and age-to-length conversion matrix, and McAllister-Ianelli weights

# Fit to the AI survey

# Fit to the EBS survey index

# BSAI fishery age composition

# Fishery length composition

# AI survey age composition

# EBS survey age composition

Not a great fit to the EBS survey age compositions

2000 year class is strong in the AI age data, not so much in the EBS data

Some arguments about a combined BSAI for blackspotted apply here as well:

- 1) Different year class strengths in the 2 areas
- 2) Different ecosystems

# EBS and AI survey selectivity

# Fishery selectivity

Recent 5-year average selectivity is higher at younger ages, lowering  $F_{spr}$  reference points.

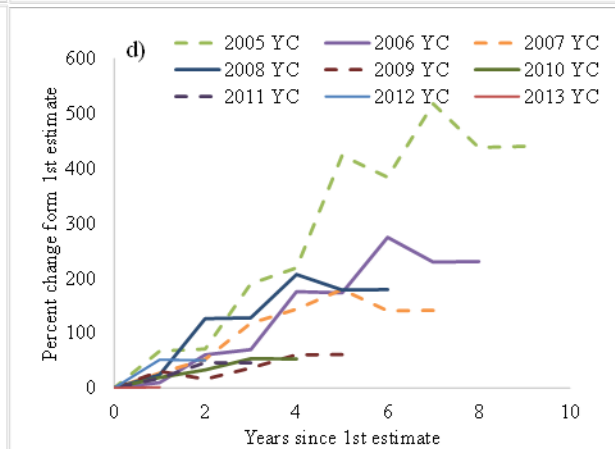

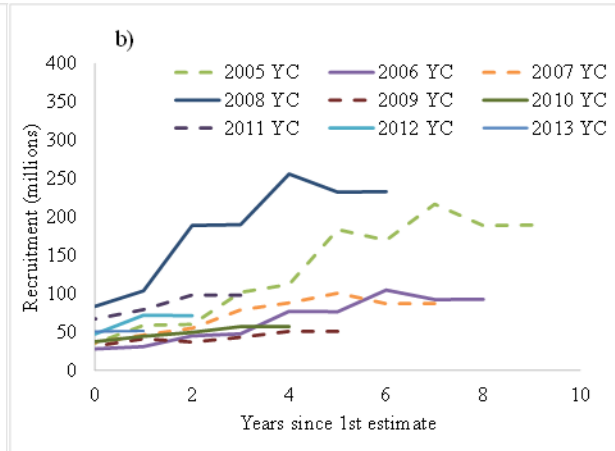

# BSAI POP retrospective pattern

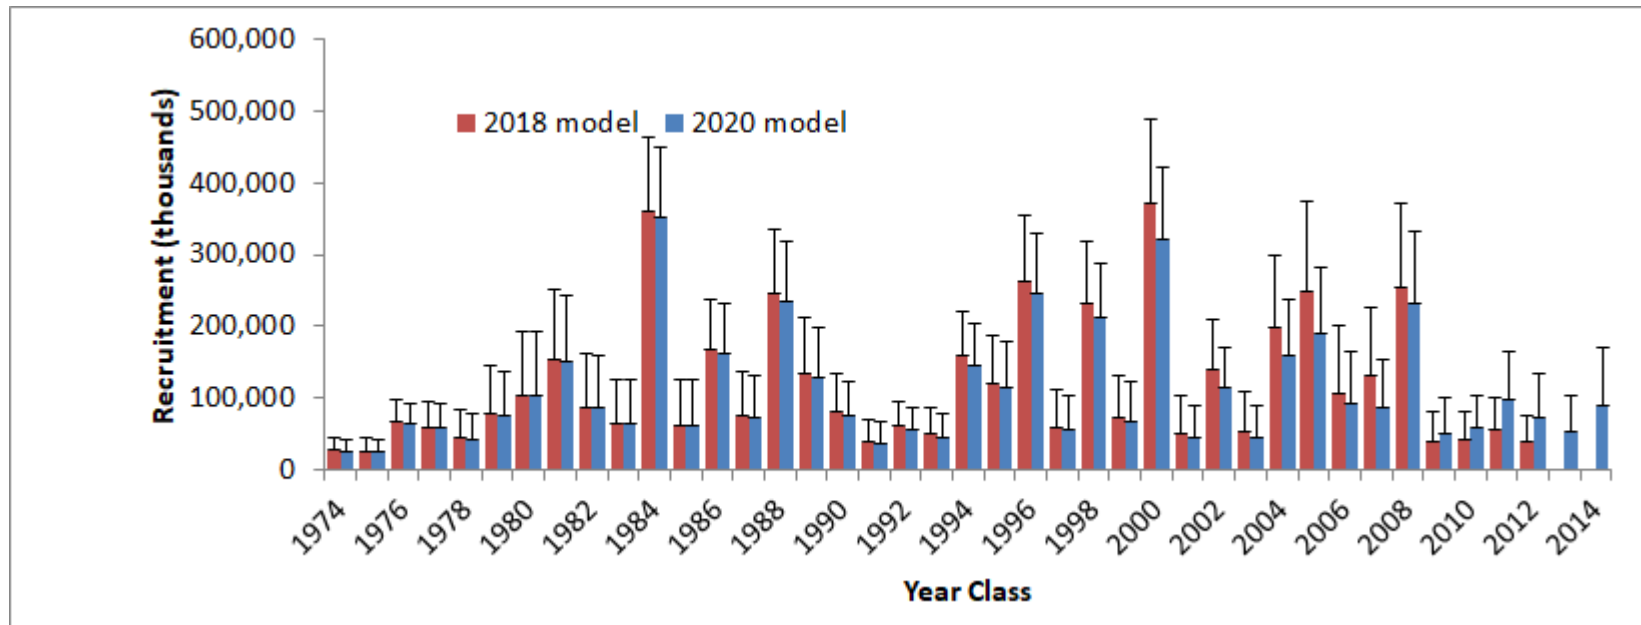

Mohn's rho = -0.24

(-0.45 in 2018 assessment)

# Retrospective estimates of recruitment

# BSAI POP recruitment

# Phase plane plot

# Natural mortality

(BSAI Plan Team, November 2018) *The Team also recommends updating the prior on M using alternative methods for the next full assessment (e.g., Hamel method, Jason Cope online application, [http://barefootecologist.com.au/shiny\\_m.html](http://barefootecologist.com.au/shiny_m.html)).*

:

Method	Model	Maximum Age		
		79	104	129
Then <sub>1parm</sub>	$M = a/t_{max}$	0.065	0.049	0.040
Then <sub>lm</sub>	$\log(M) = a + b \log(t_{max})$	0.067	0.051	0.041
Then <sub>nls</sub>	$M = at_{max}^b$	0.090	0.070	0.057

Average of 0.059 in table above

2020 assessment: Prior distribution for M has mean of 0.05, and CV of 0.05 (unchanged from previous assessments).

Estimate of M in 2020 assessment: 0.056.

# Sensitivity model runs

(SSC, December 2018) *The SSC encourages the author to look at sequentially removing data sources to see what data source may be causing the poor fit and residual pattern for the AI survey.*

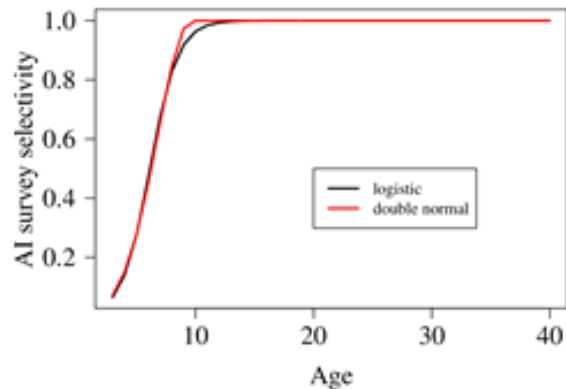

The residual pattern in the fit to the AI survey biomass is not attributable to any single composition data set, but rather the combination of the compositional data sets.

# Sensitivity model runs

(SSC, December 2018) *Additionally, allowing survey selectivity to be a little more flexible in shape may be worth exploration.*

Model run with double-normal selectivity, allows for dome-shaped patterns.

For BSAI POP, the increase in survey biomass estimates, and the distribution across a wide range of survey ages, do not suggest dome-shaped survey selectivity.

# Risk table considerations

- Assessment considerations: “data-inputs: biased ages, **skipped surveys**, lack of fishery-independent trend data; model fits: **poor fits to fits to fishery or survey data**, inability to simultaneously fit multiple data inputs; model performance: poor model convergence, multiple minima in the likelihood surface, parameters hitting bounds; estimation uncertainty: poorly-estimated but influential year classes; **retrospective bias in biomass estimates**.”
- Level 2: Substantially increased uncertainty/unresolved issues. Strong retrospective bias that could represent model misspecification, but population dynamics and/or observational processes have not been identified. Poor residual pattern in fitting recent AI survey biomass estimates. Strong prior on natural mortality understates model uncertainty.

# Risk table considerations

- Population dynamics considerations: “decreasing biomass trend, poor recent recruitment, inability of the stock to rebuild, **abrupt increase or decrease in stock abundance**.”
- Level 1: Stock trends are typical for the stock; recent recruitment is in the normal range.

Rapid increase in the stock between 2006-2010 is somewhat unusual, although there is precedence for the stock rebuilding quickly from periods with strong recruitments. Recent recruitments have been lower.

# Risk table considerations

- Environmental/ecosystem considerations: *"adverse trends in environmental/ecosystem indicators, ecosystem model results, decreases in ecosystem productivity, decreases in prey abundance or availability, increases or increases in predator abundance or productivity."*
- Level 1: Normal. *"Taken together, these indicators suggest no clear concerns for the POP stock aside from the recent stretch of increased temperatures. That being said, the recent increasing trend in the POP stock suggests that the temperature impacts have not been limiting. However, the lack of data in 2020 limits our assessment of potential recent ecosystem impacts on this stock. Overall, we rank the assessment considerations as a 1"*

# Fishery CPUE

Tons/hr, from tows targeting POP based on haul species composition. Source: North Pacific Groundfish Observer Program.

# Risk table considerations

- Fishery performance considerations: “fishery CPUE is showing a contrasting pattern from the stock biomass trend, unusual spatial pattern of fishing, changes in the percent of TAC taken, changes in the duration of fishery openings.”
- Level 1: No apparent fishery/resource-use performance and/or behavior concerns.

Fishery CPUE was relatively stable from 2004-2016. A decline in CPUE has occurred since 2017, which might be related to change in fishing practices in order to better avoid bycatch stocks.

# Conclusions

- Continued high abundance of POP, but declining recently.
- High survey biomass estimates have been keeping the estimated biomass in the assessment at a high level. Without a 2020 survey, the estimated biomass is lower.

# Reference points and ABCs

Quantity	As estimated or specified last year for:		As estimated or recommended this year for:
