

St. Matthew Blue King Crab

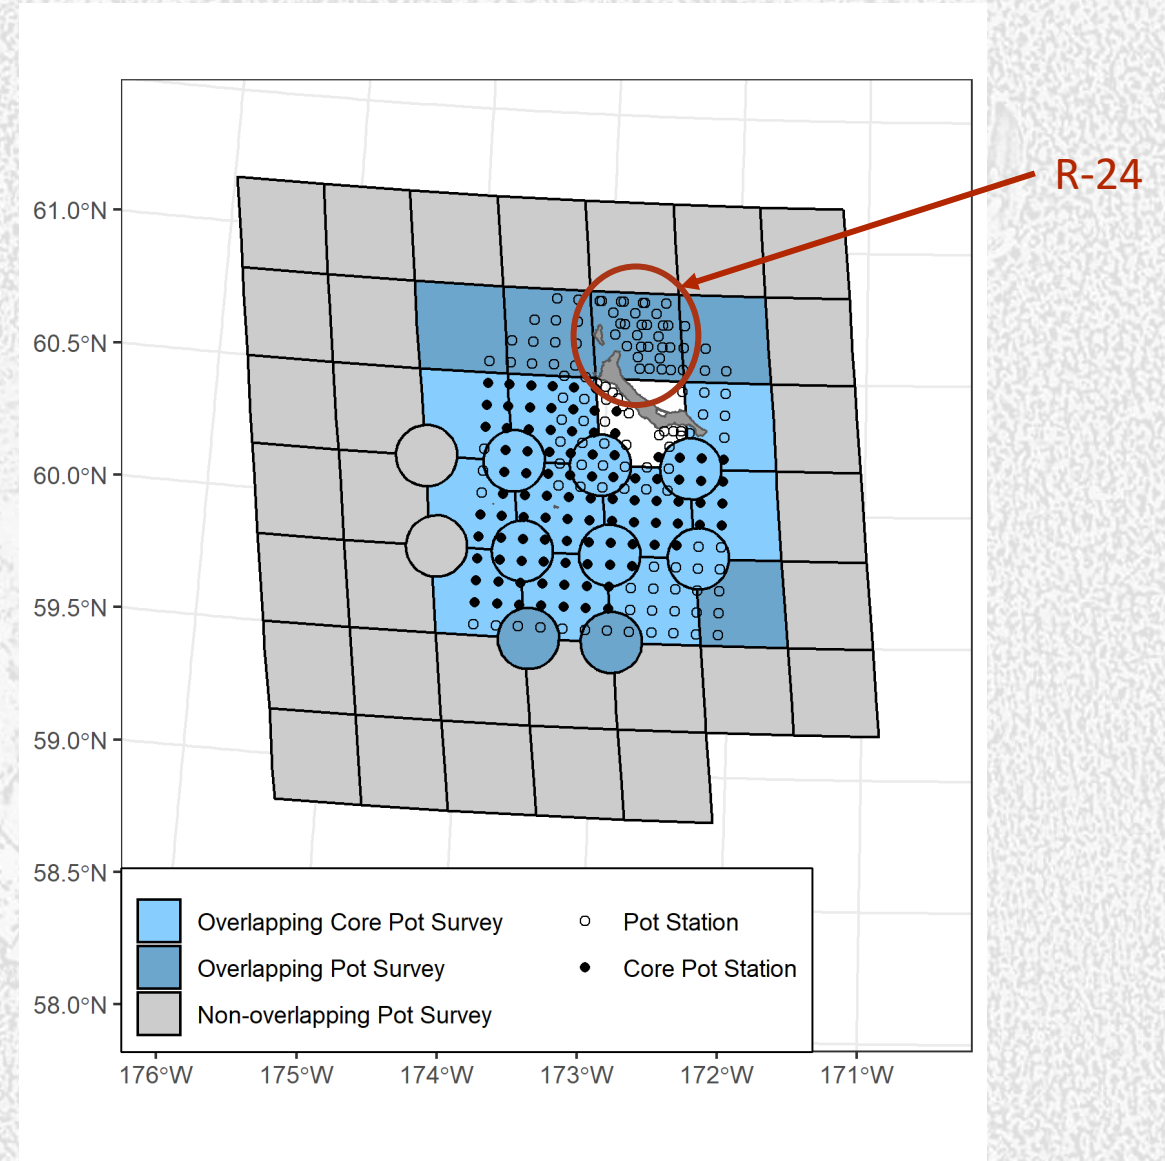

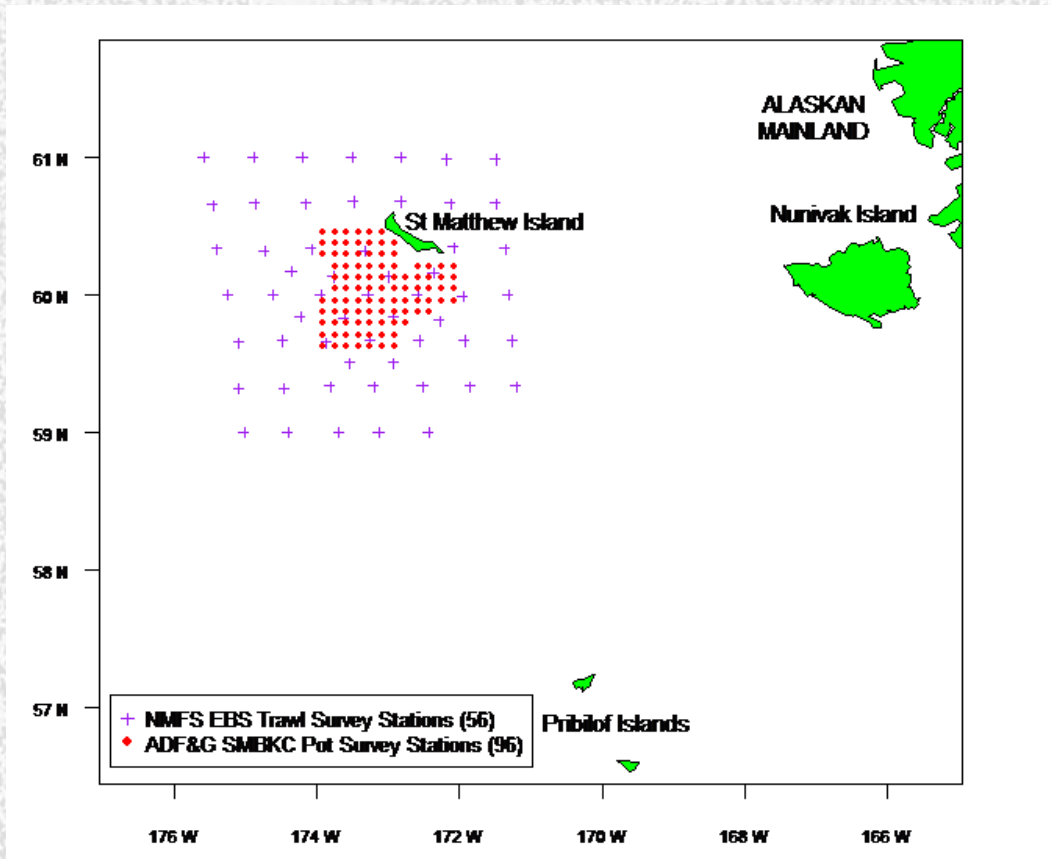

May 2022 proposed models

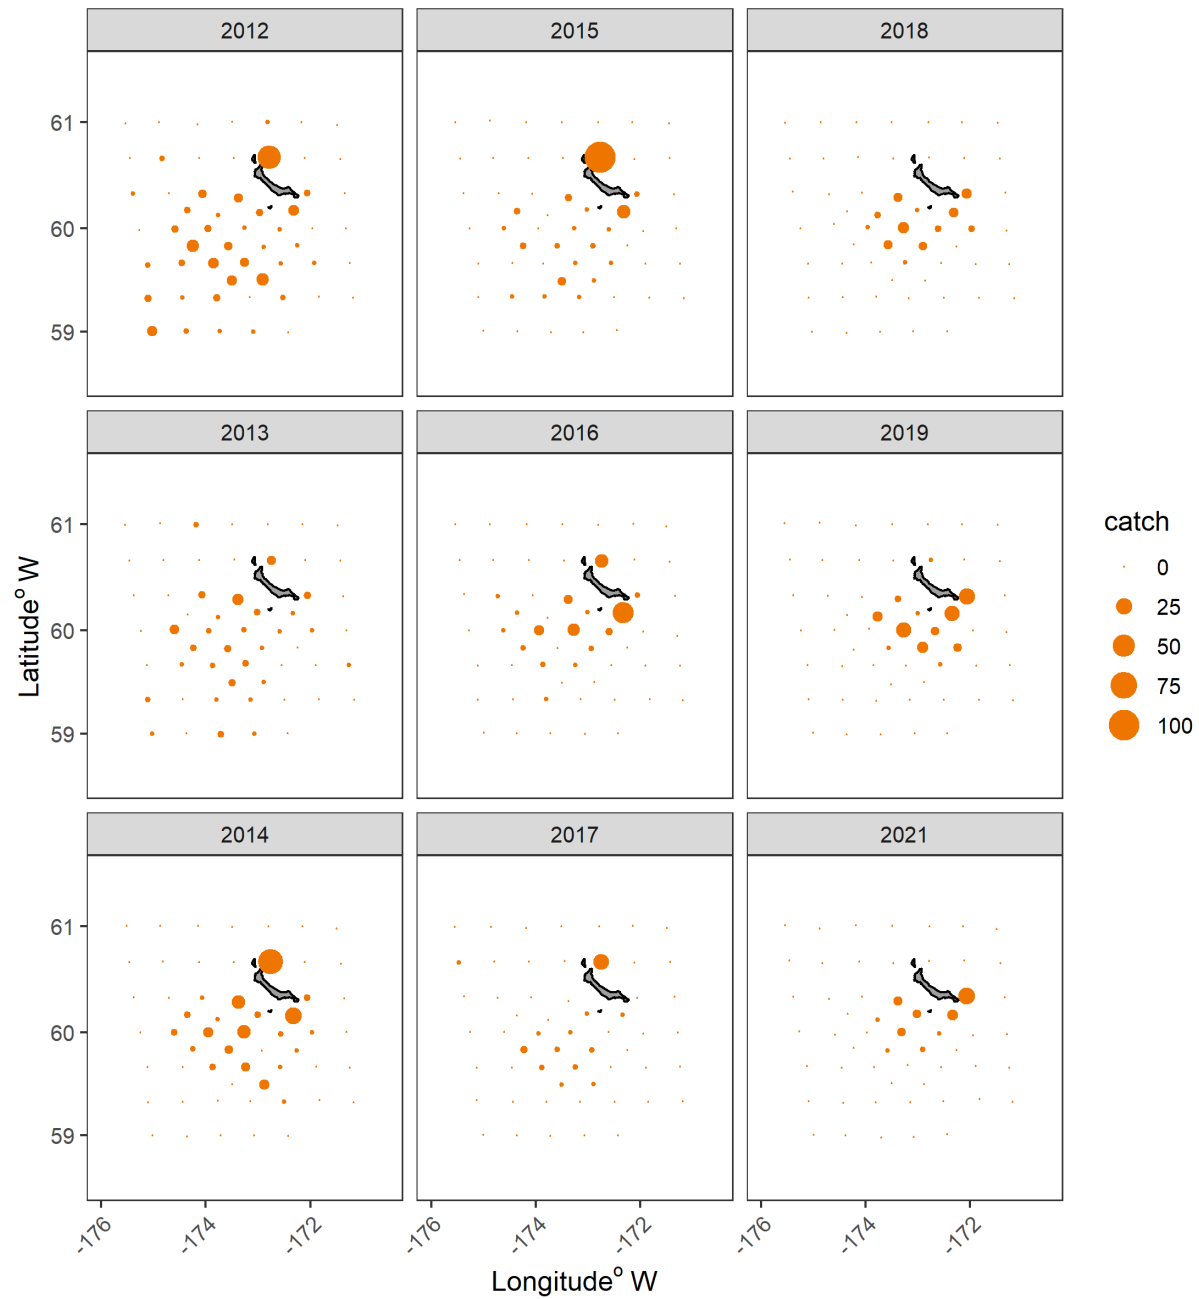

Katie Palof, Jie Zheng

Current Status

- Last full assessment Sept. 2020 (moved to biennial cycle)
- Overfished
- Under rebuilding plan to be updated this fall (2022)
 - No changes to fishing regulations
 - No further bycatch restrictions
 - Focused on recruitment expectations
- Core model issues
 - Discrepancies in trends between pot survey and trawl survey
 - Spatial hot spots in surveys
 - Poor fit of models to recent years survey data (2010+)

Trawl survey
(area-swept)
spatial
breakdown in
catch

CPT / SSC comments

Explore potential explanations for the discrepancy in the time trends of the two types of survey data, including movement hypotheses using spatial models (not necessarily VAST)

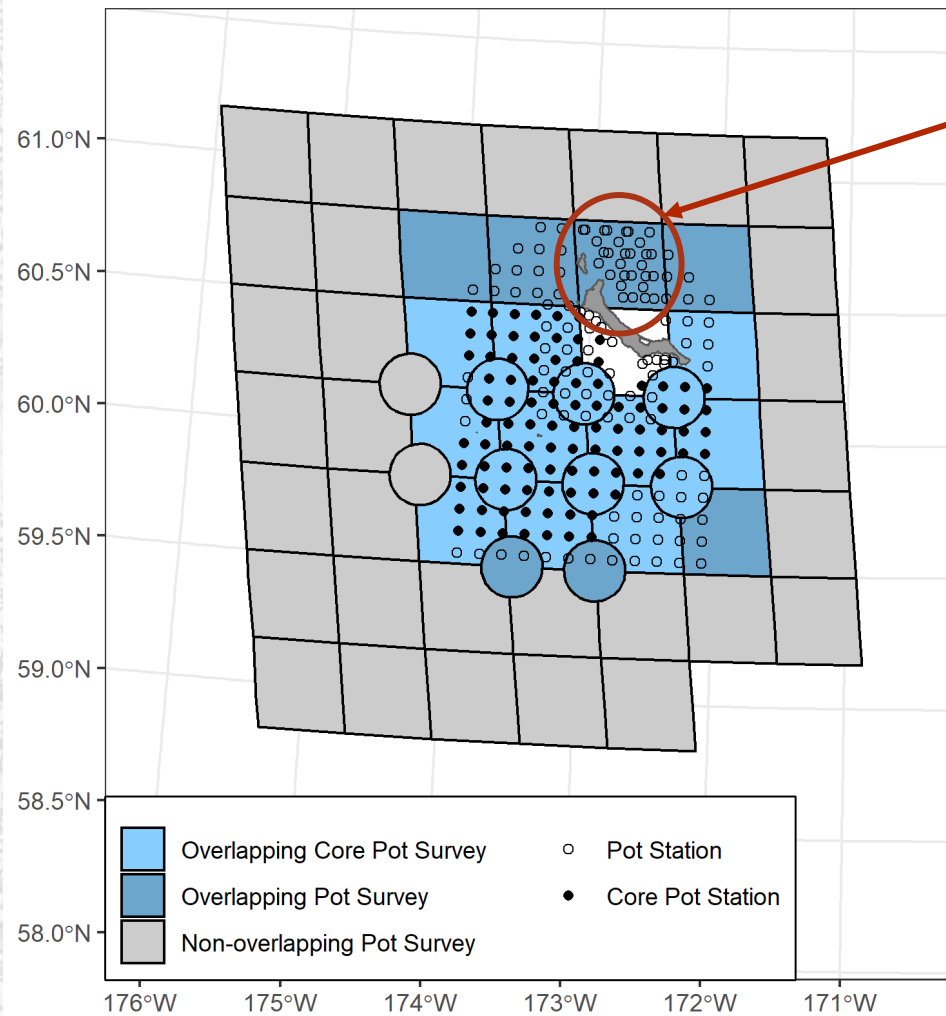

Exploration of the spatial extent and density differences between the surveys was done on all male crab included in the model (Appendix C). The authors plan to use this and further analyses to better characterize catchability/availability for the pot survey.

Random walk or exploration of catchability

The initial model of time blocks for Q did not show much potential for this in May 2020, therefore time blocks were not a focus for May 2022. More coding work is needed to make a true random walk for catchability in GMACS and this will be added to model development.

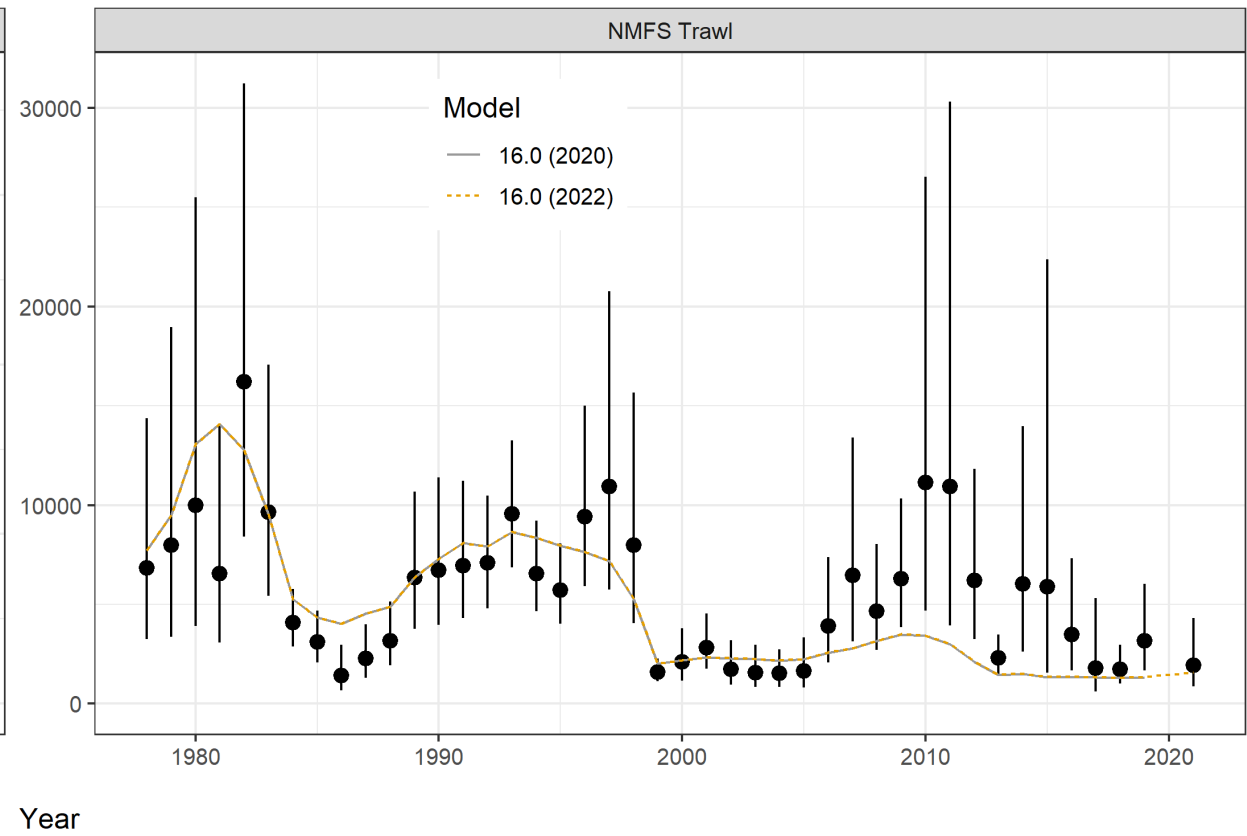

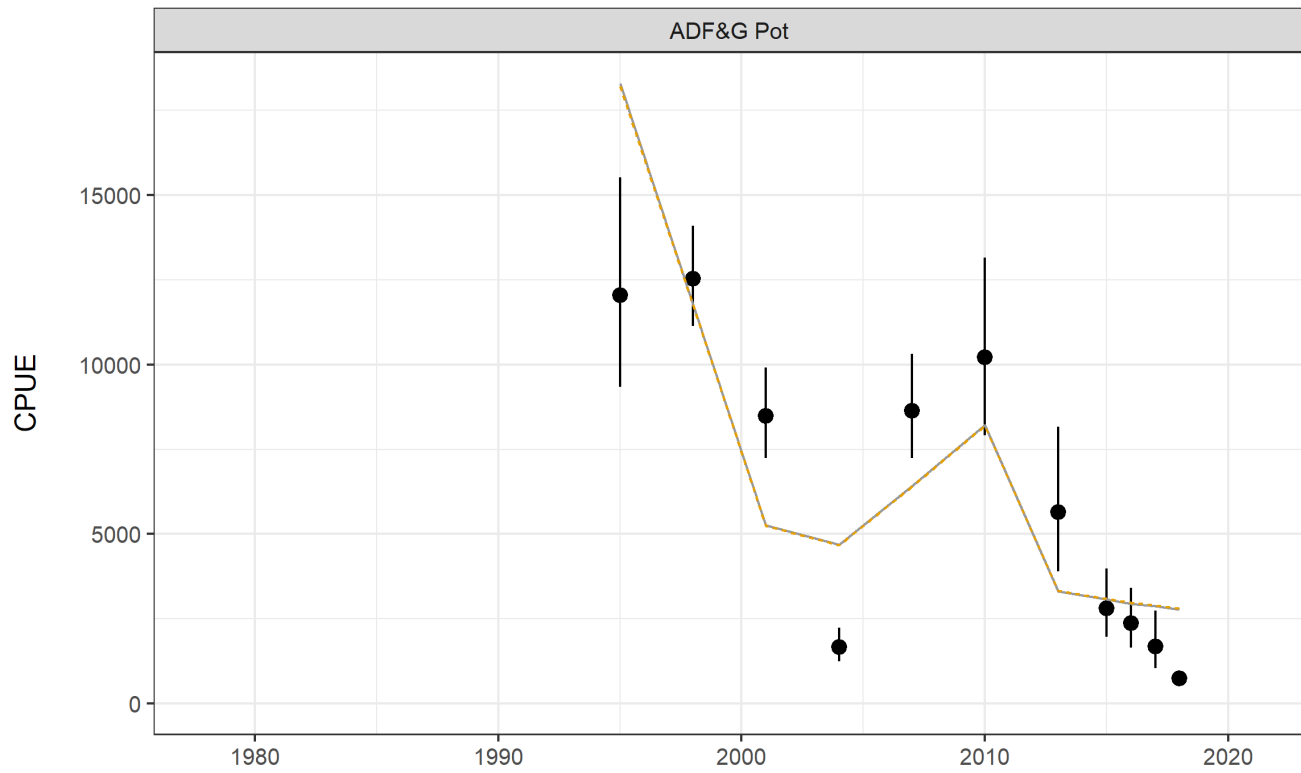

Explore the assumed and estimated life history parameters (e.g., natural mortality, growth, and maturity) to ensure the best available science is being used to assess this stock.

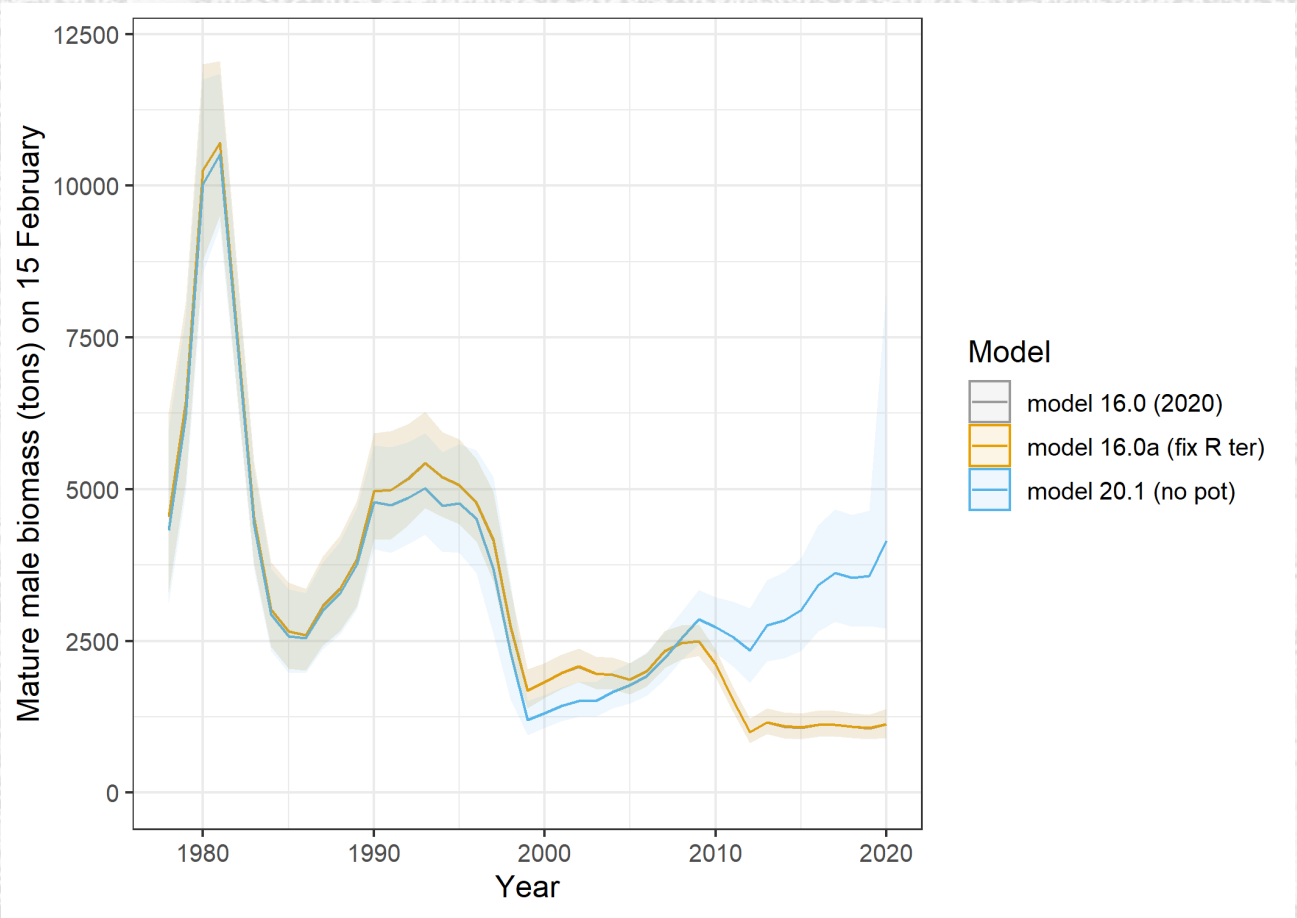

Specific research on St. Matthew blue king crab life history parameters is not available and therefore these are borrowed from other stocks/species. At this time only sensitivities of the model to increased natural mortality (M) were looked at here (Models 22.0a and 22.0b). Sensitivities to the model assumptions on growth and maturity will be explored at a later date.

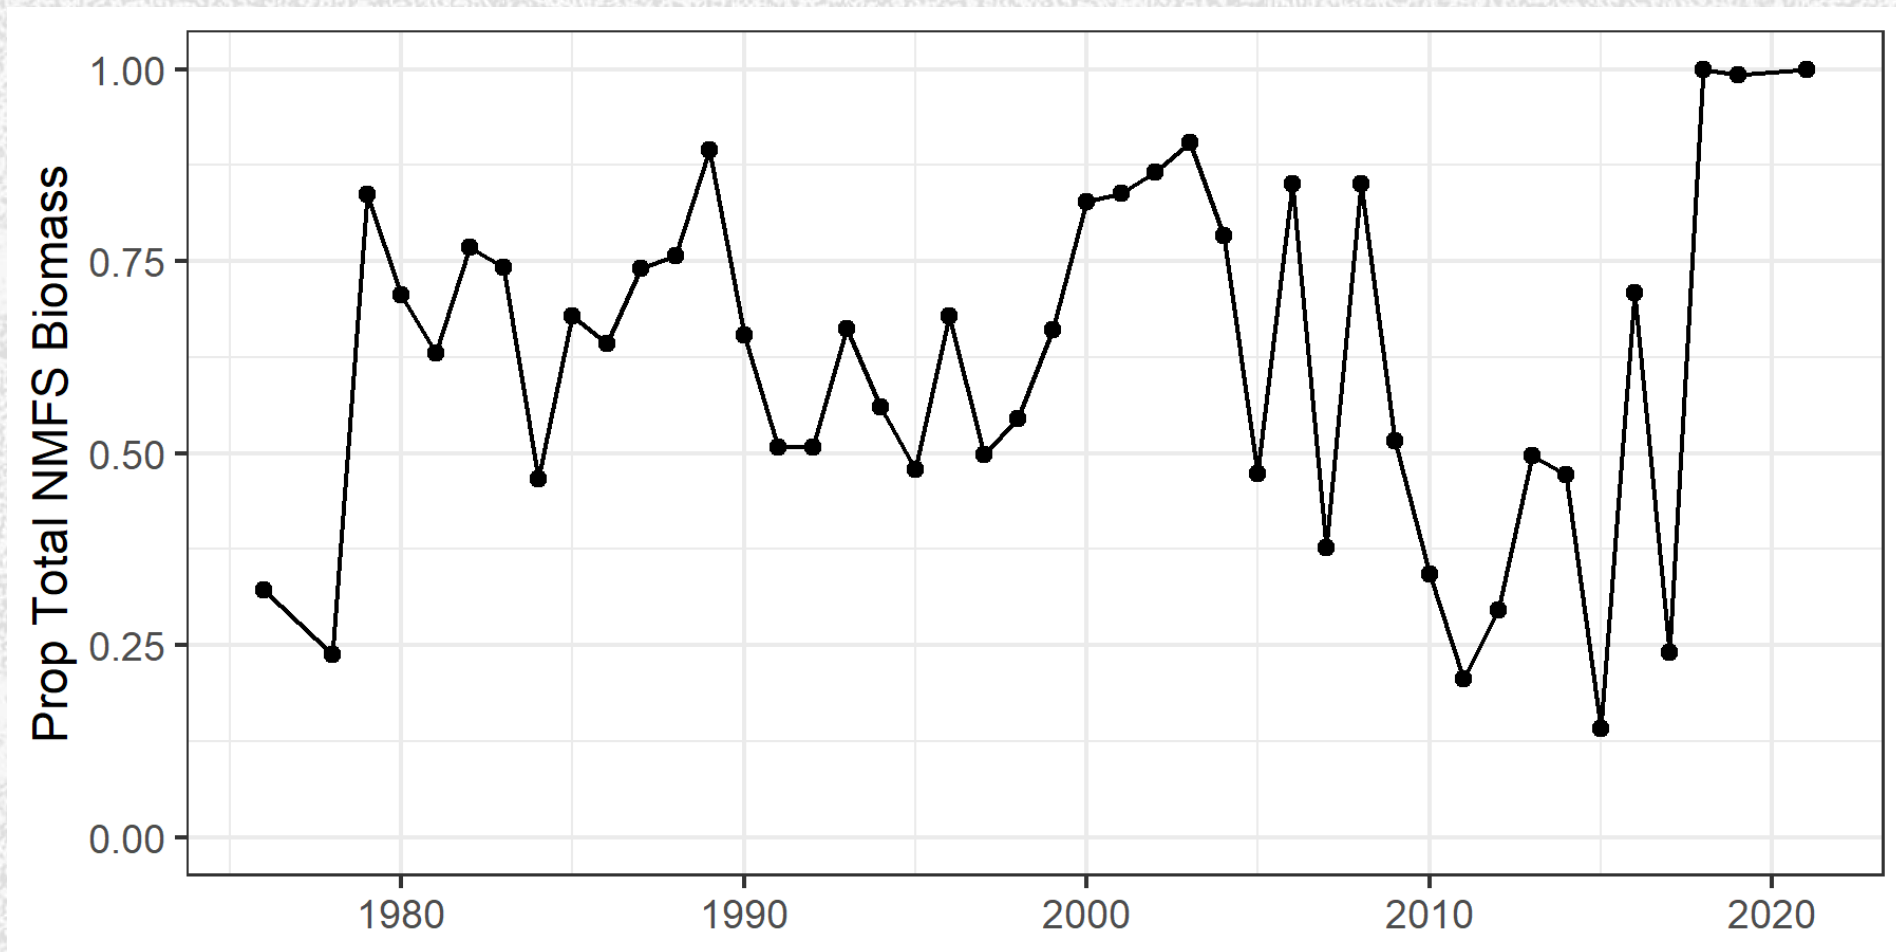

R-24

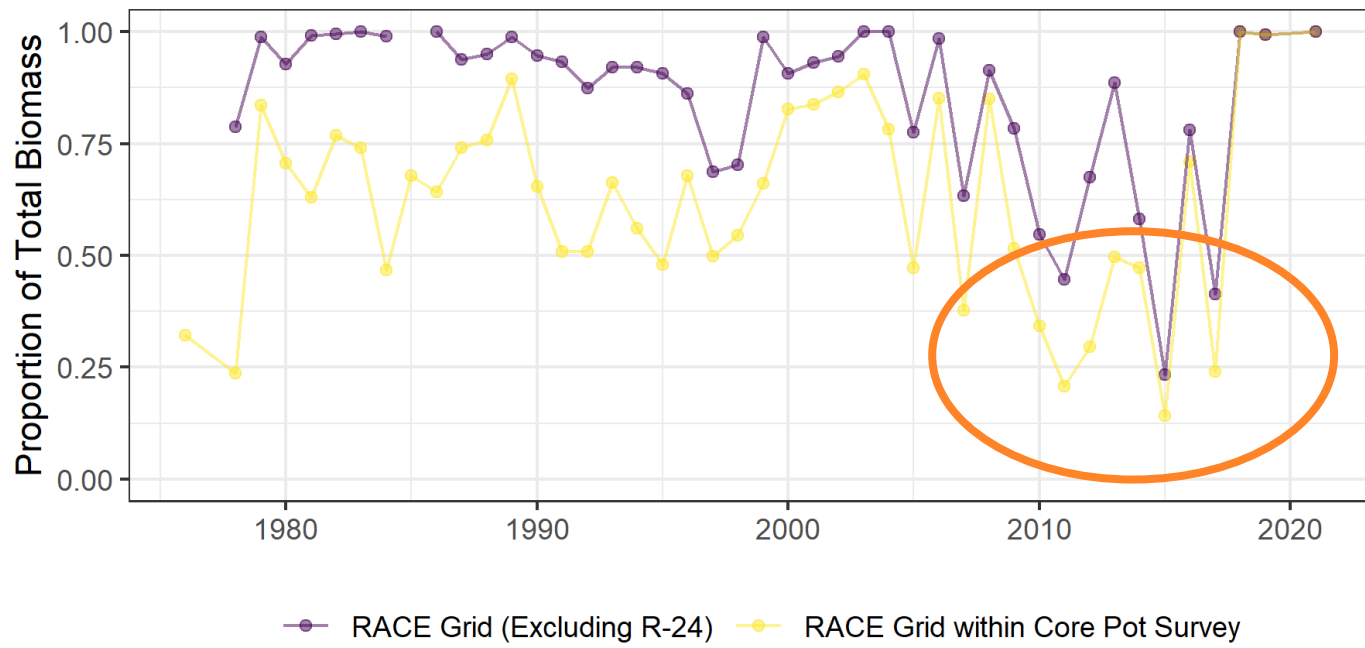

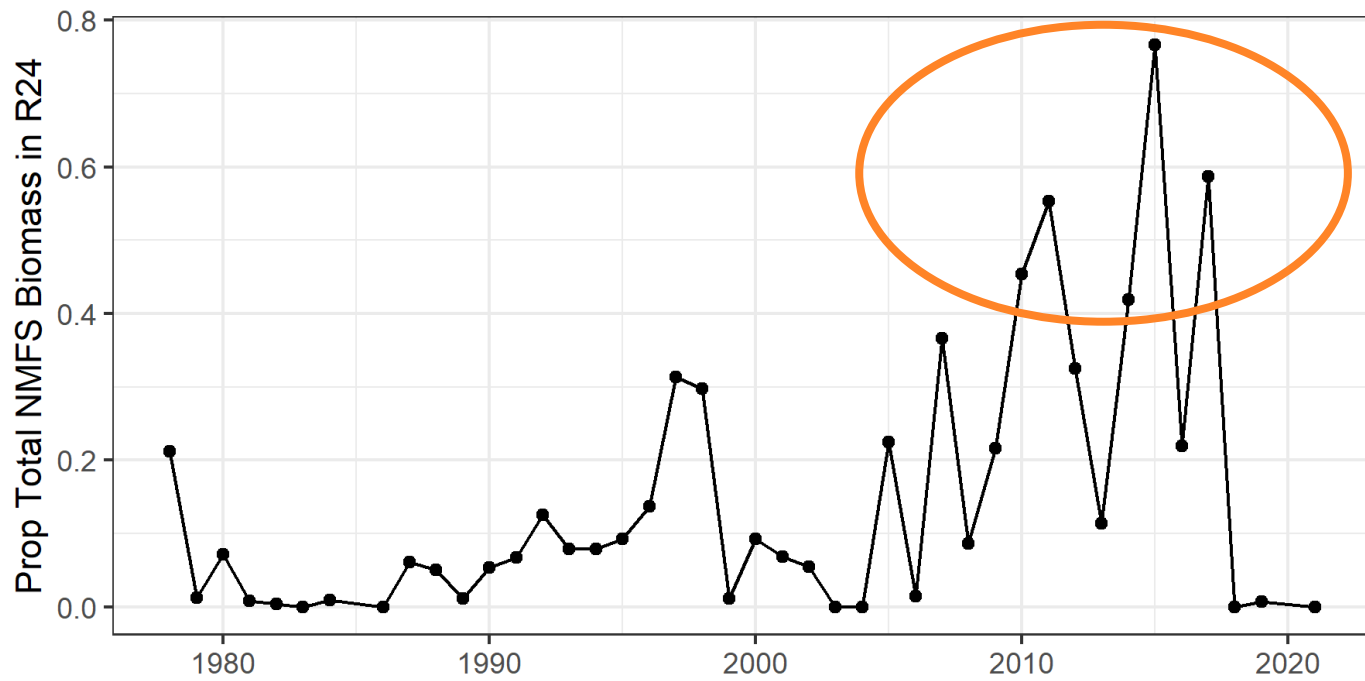

- Blue (survey overlap)
- Light blue core pot survey overlap
- Sampling density differences
- NMFS trawl survey samples in R-24 annually
- ADF&G pot survey R-24 sampling is opportunistically

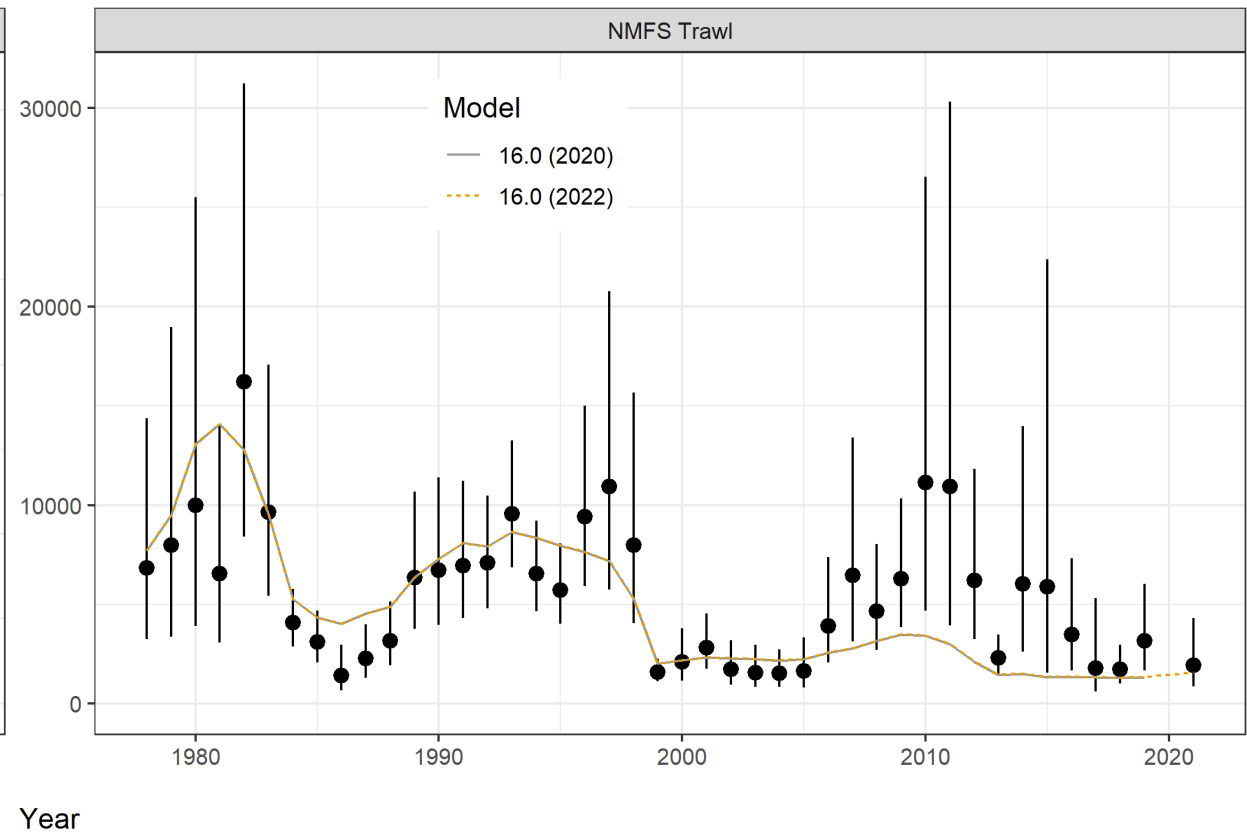

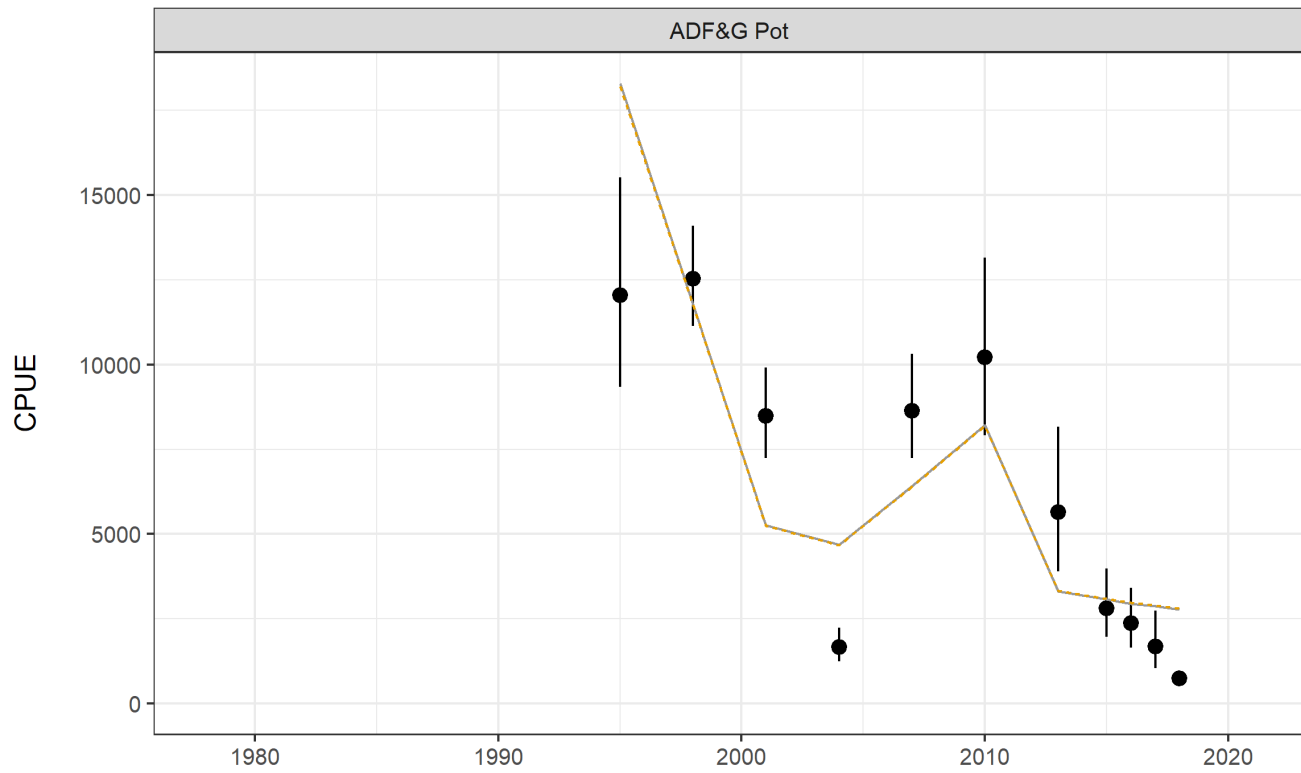

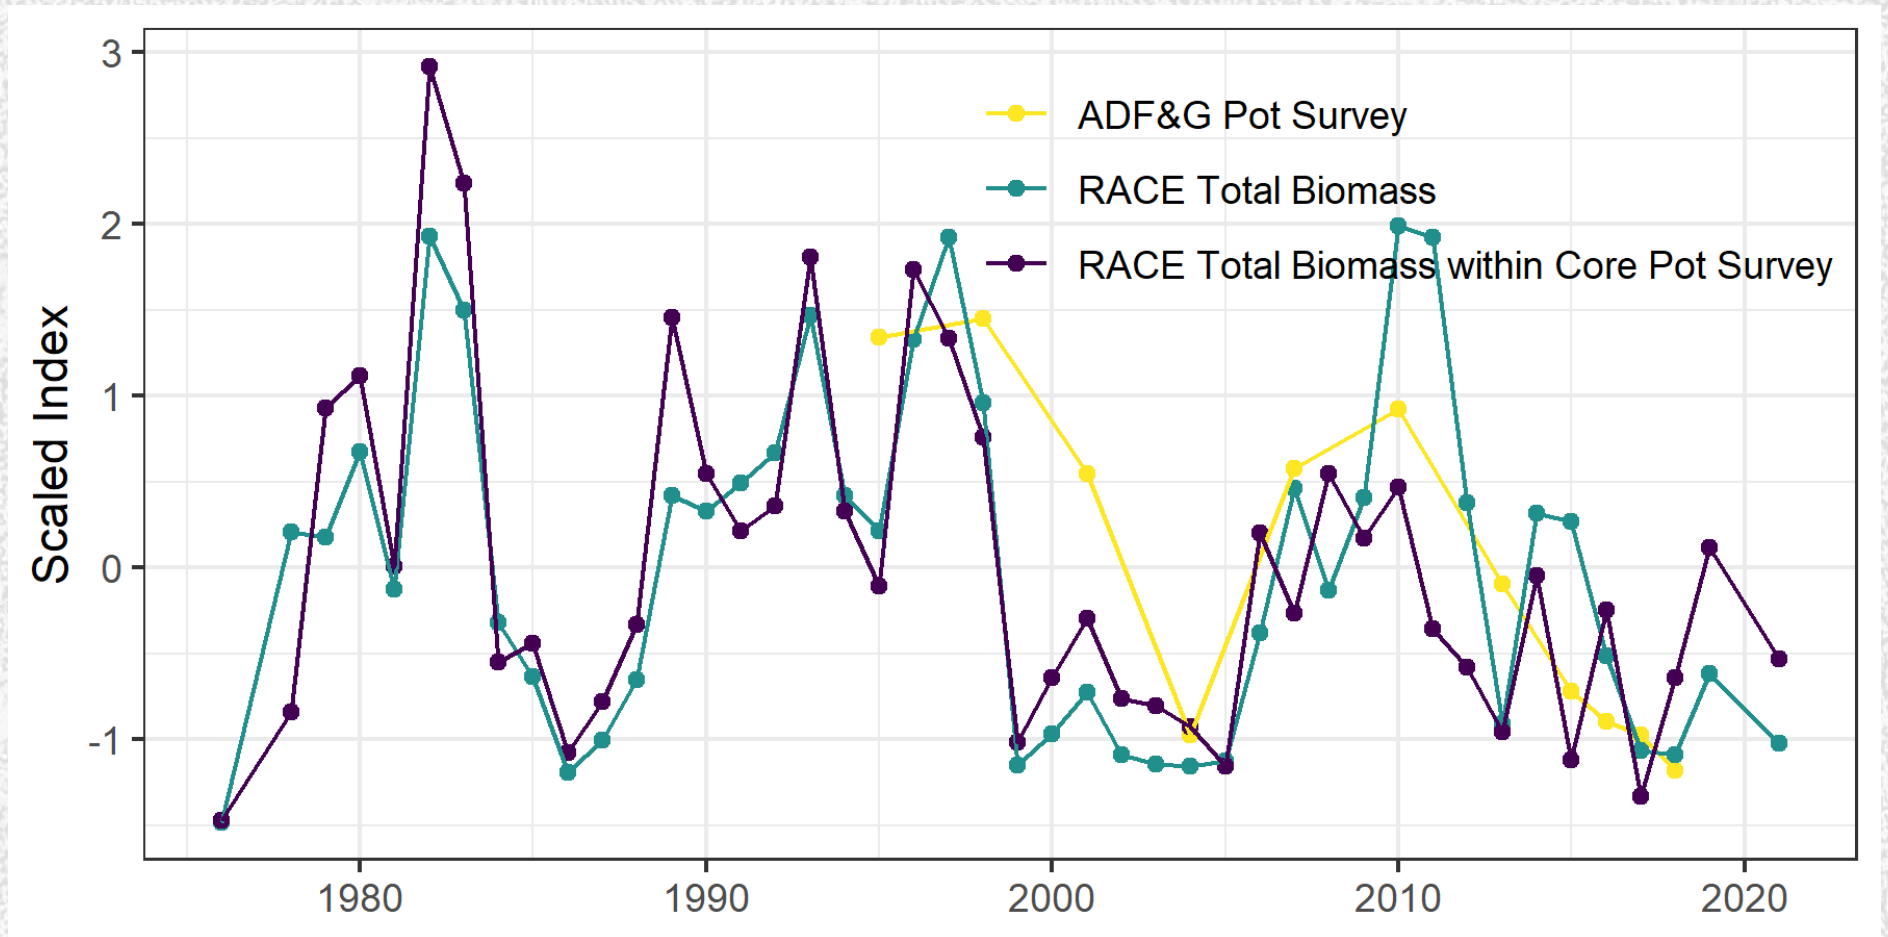

Proportion
of NMFS
biomass in
core 96
ADF&G pot
stations

Influence of R-24

Recommendations from survey explorations

- time blocks for Q in the NMFS data set to accommodate the changes observed from 2005 to 2017
- inclusion of additional pot survey data outside the 96 in-common stations, with accommodating “availability” parameters in these years
- using the NMFS trawl survey data with the same spatial footprint as the pot survey (purple trend line compared to green in Figure 9)

Model explorations

16.0 - 2020 Reference Model:

- Base model accepted in Sept. 2020

16.0 - 2022 Reference Model:

- model 16.0 with updated 2021 NMFS trawl data (biomass and size comps) and groundfish and crab bycatch data up to 2020/21 (removals)

22.0a - fixed $M = 0.21$:

- Model 16.0 with natural mortality increased to 0.21

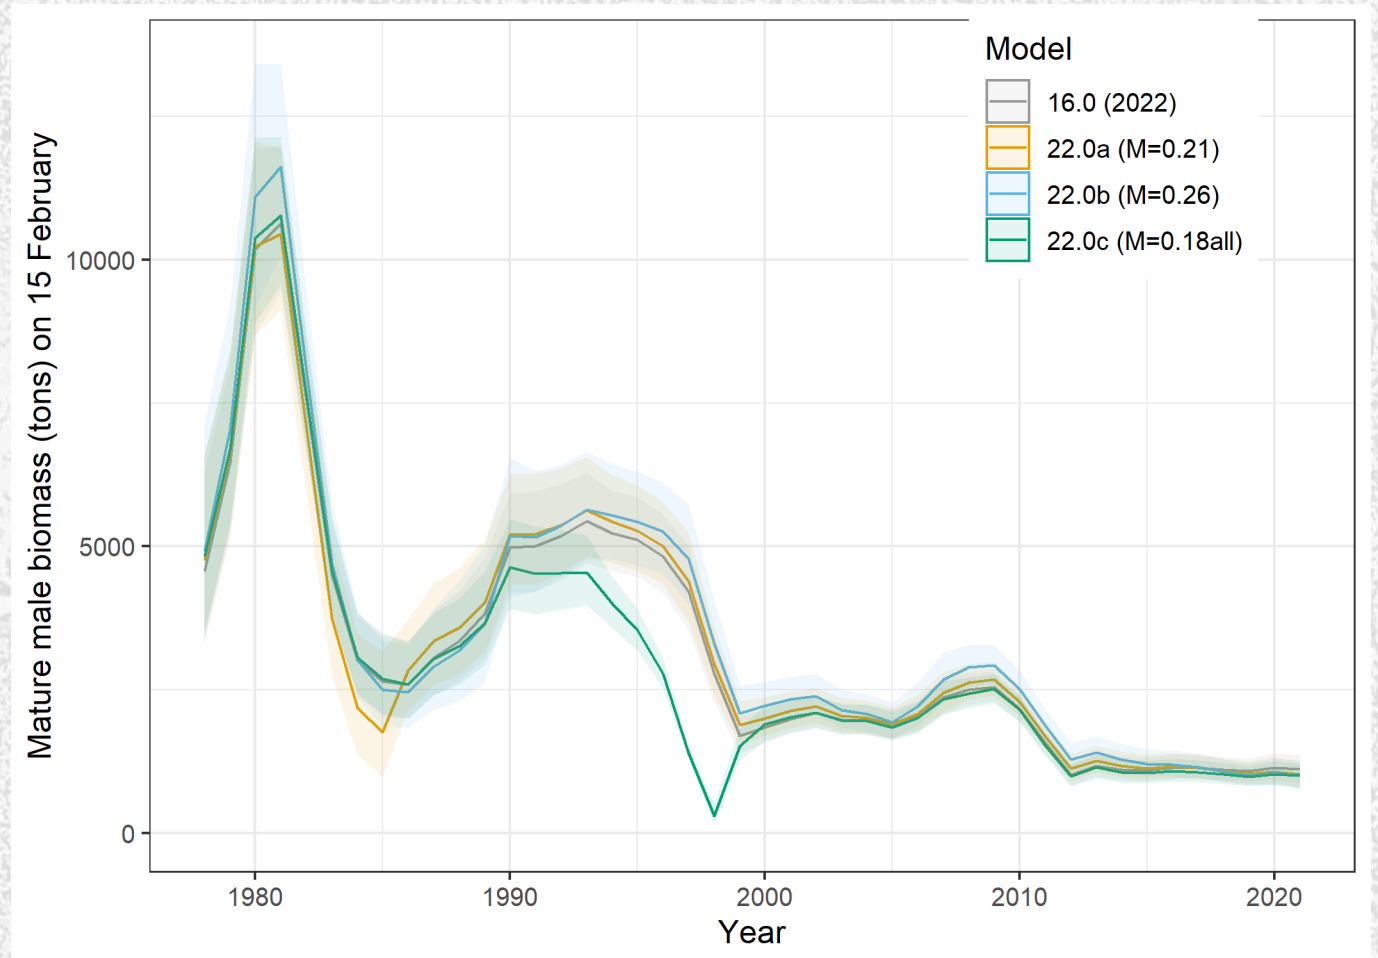

22.0a - fixed $M = 0.26$:

- Model 16.0 with natural mortality increased to 0.26

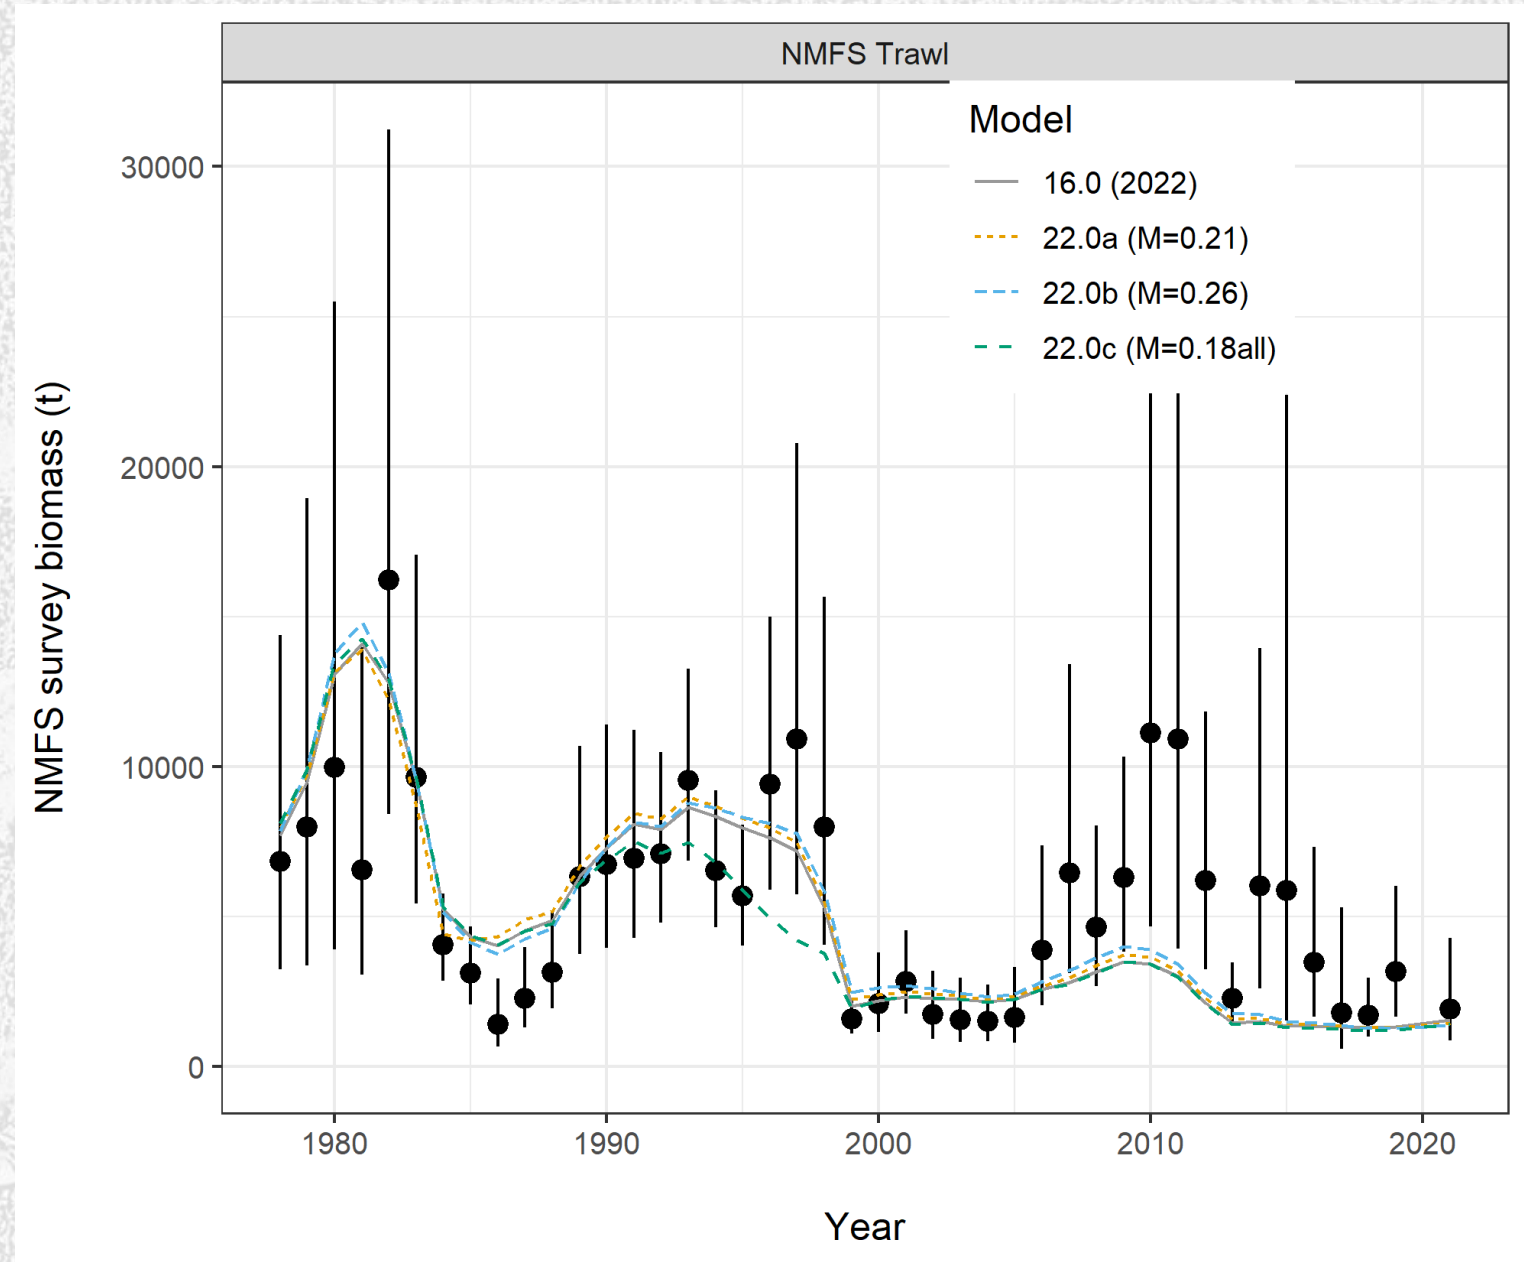

22.0c – no time blocks for M

- Natural mortality is fixed for all years at 0.18, no time blocks for large decrease in 1998

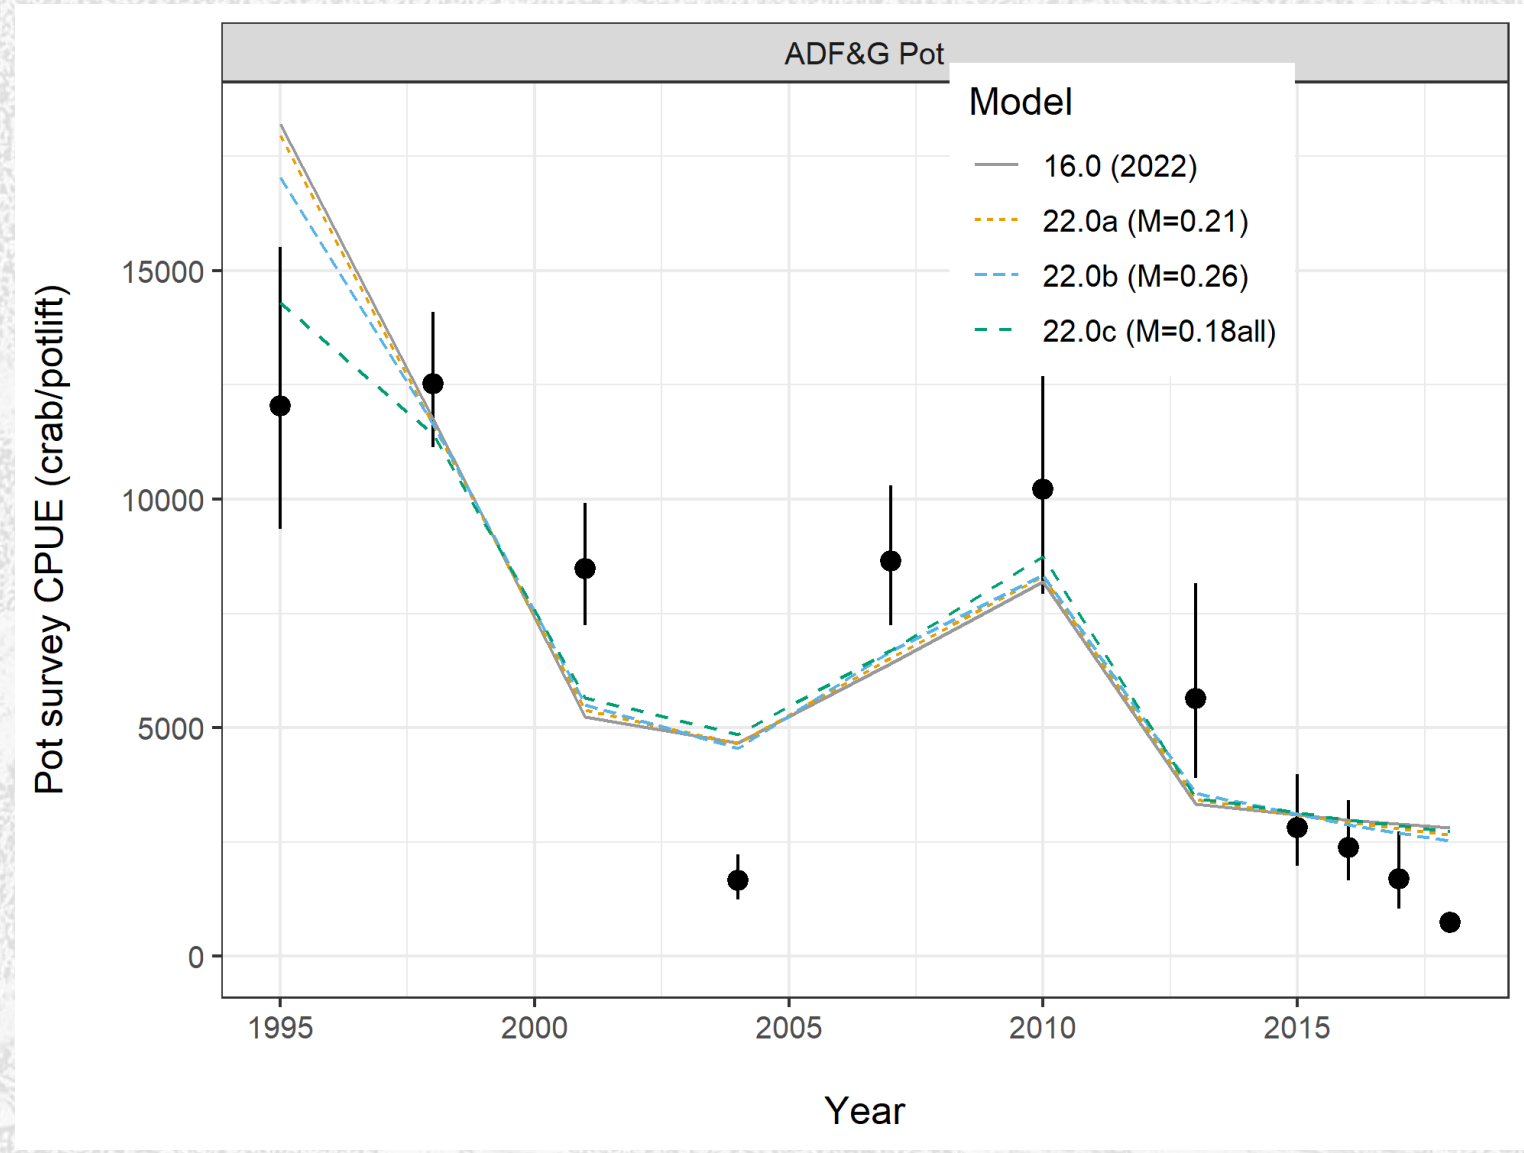

- No discernable difference with updated reference model 2020 to 2022 (fig 6-9)
- Model without time block (22.0c) largest change in MMB

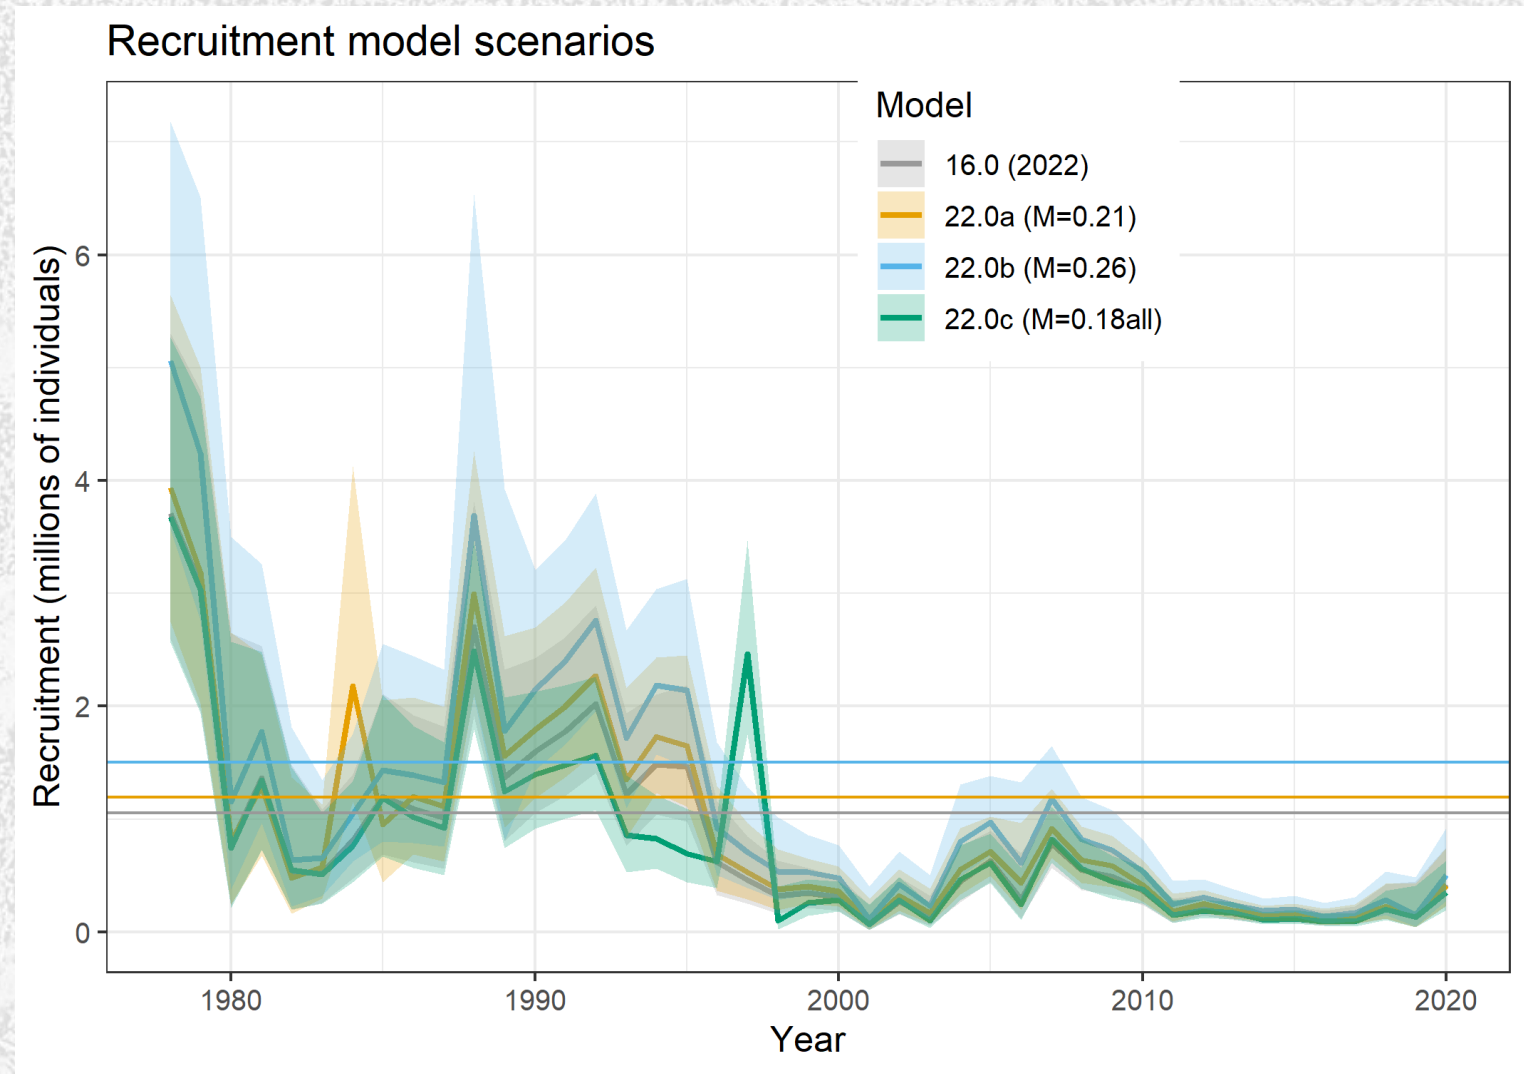

Model without time blocks fits data differently in late 90s.

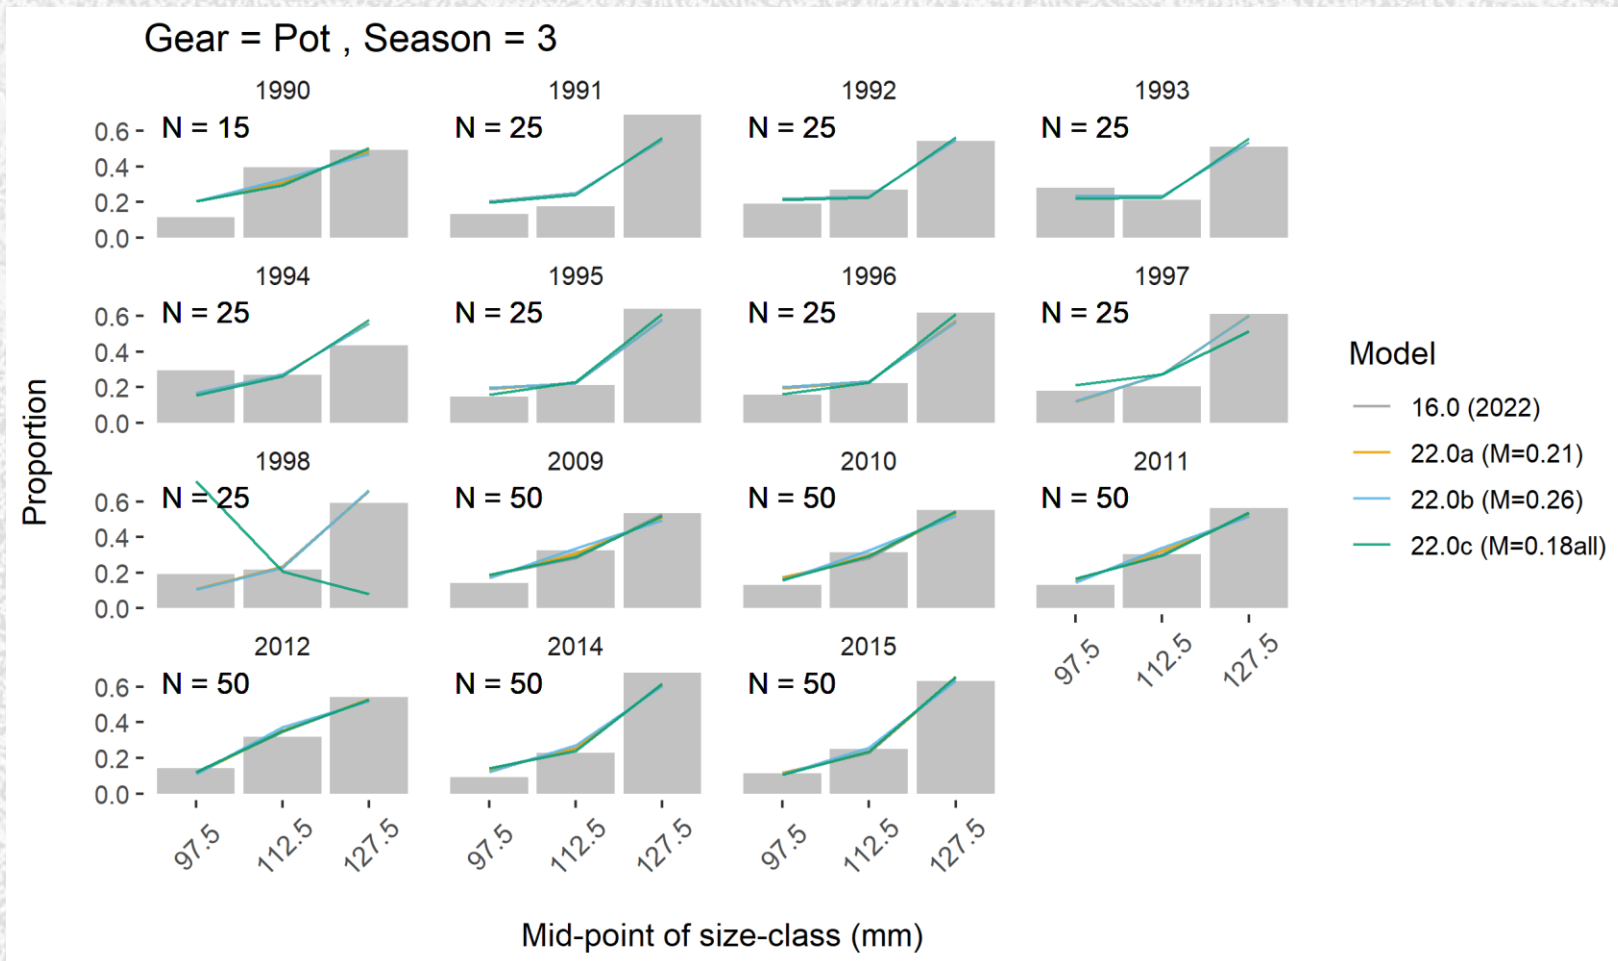

Model without time blocks fits data differently in late 90s.

Model without time block has spike in late 90s.

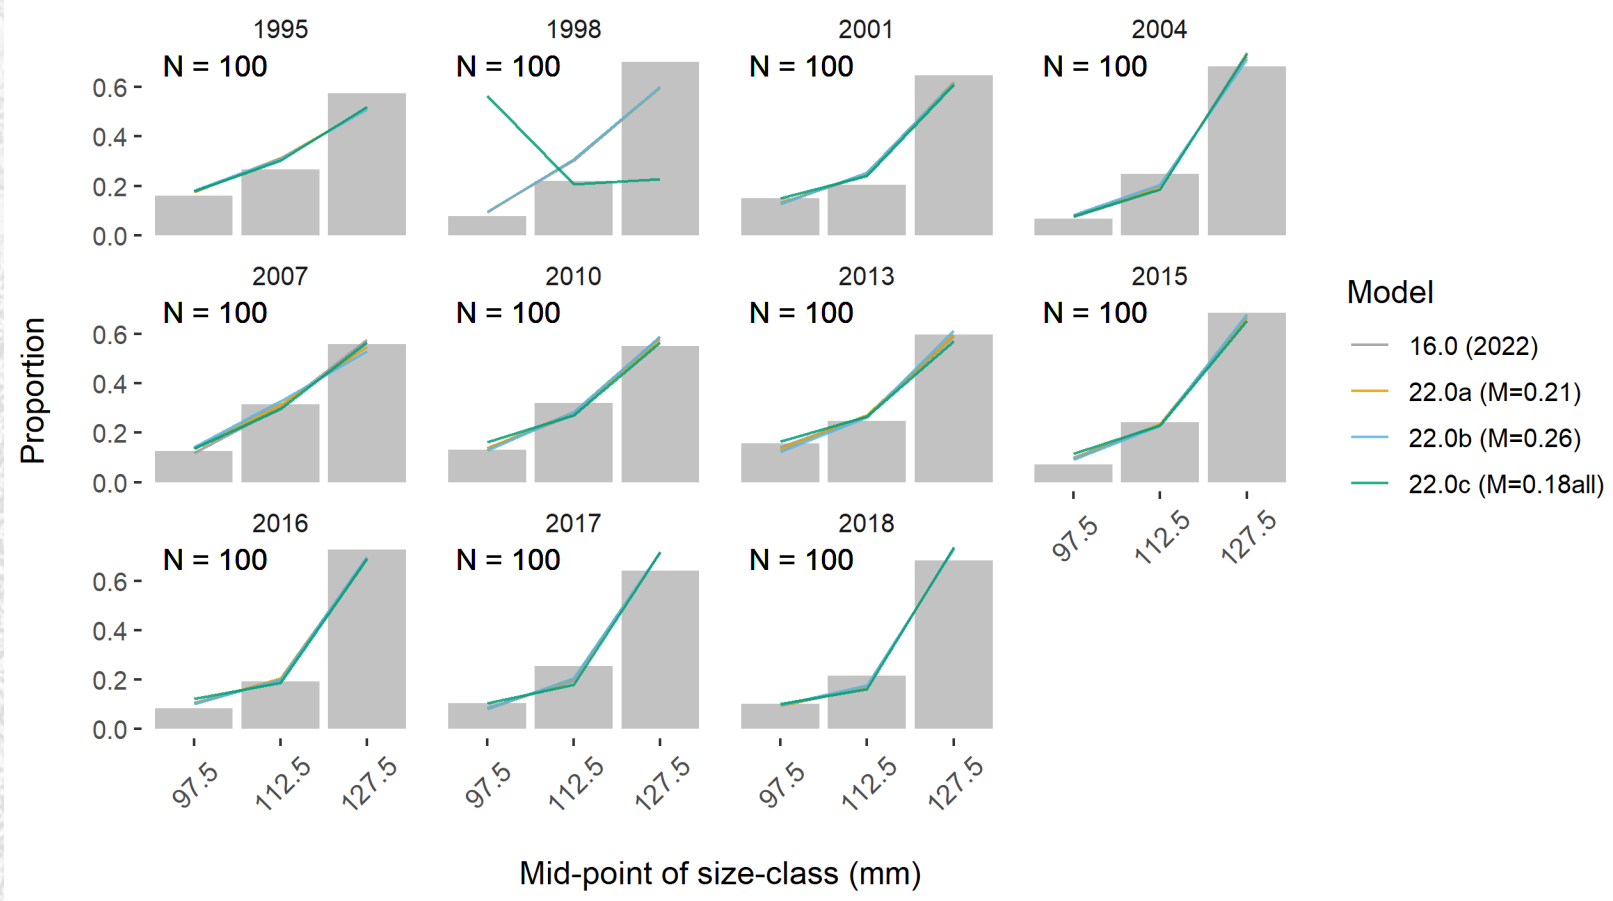

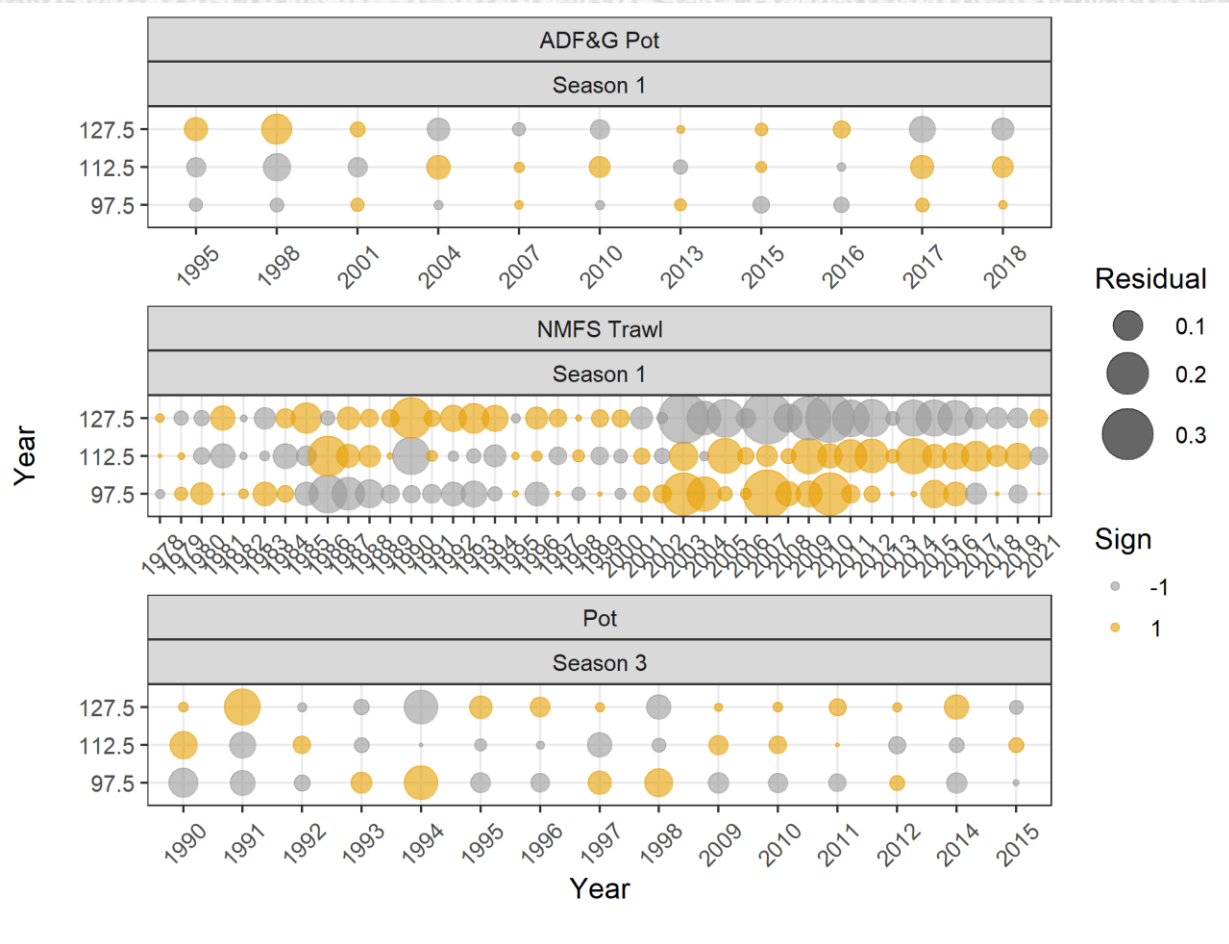

Gear = NMFS Trawl , Season = 1

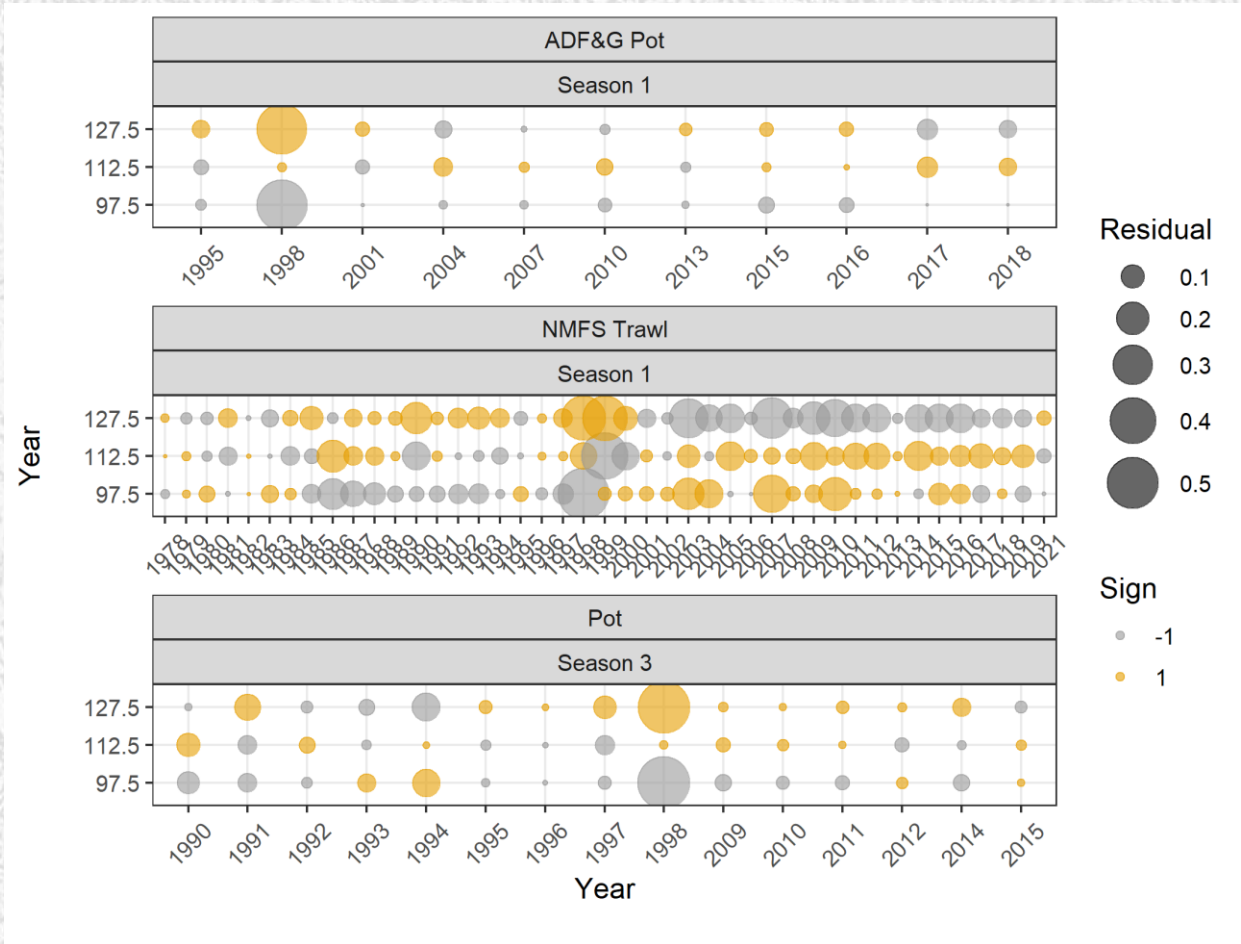

Gear = ADF&G Pot , Season = 1

Reference model (16.0)

No time blocks (22.0c)

Selectivity

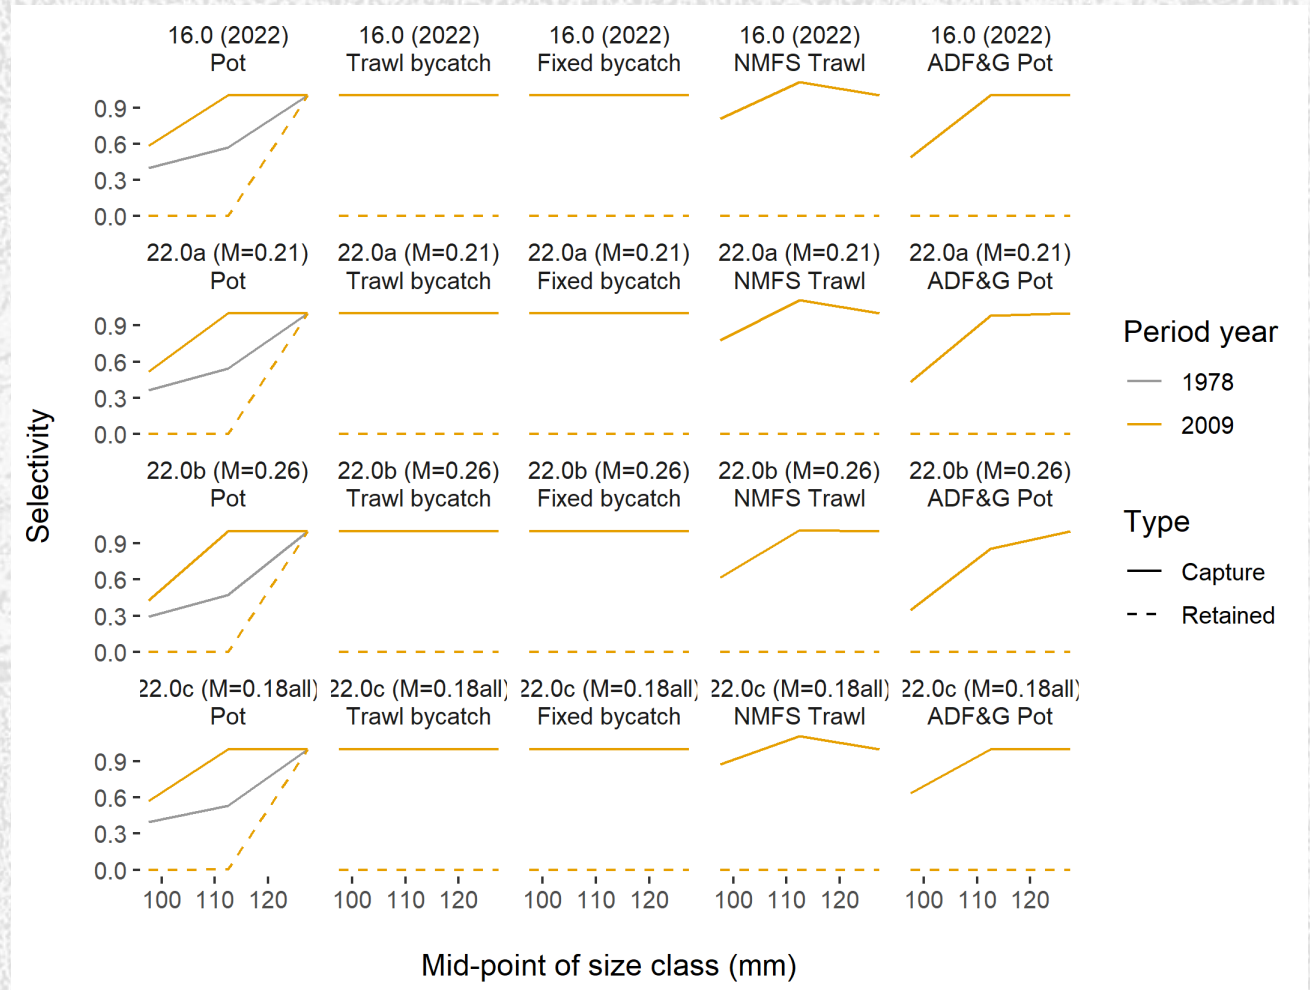

Table 16: Comparisons of parameter estimates for the model scenarios.

Parameter	Ref	M0.21	M0.26	Mall
$\log(\bar{F}^{\text{df}})$	-2.130	-2.112	-2.145	-1.947

Total estimated parameters	150.00	150.00	150.00	149.00

Table 4: Comparisons of management measures for the model scenarios. Biomass and OFL are in tons.

Component	Ref	M0.21	M0.26	Notimeblock
MMB_{2021}	1144.575	1077.861	1047.205	1032.327
B_{MSY}	3298.391	3333.337	3531.318	3005.061
MMB/B_{MSY}	0.339	0.308	0.288	0.336
F_{OFL}	0.048	0.049	0.000	0.047
OFL_{2021}	49.323	45.887	1.207	44.021
ABC_{2021}	36.992	34.415	0.905	33.016

- Management quantities are similar (error with M0.26 model in OFL)

Summary

- Model is not very sensitive to increases in natural mortality
- Removal of 1998 spike in M leads to changes in MMB and recruitment, and doesn't fit size comp data
- Reference model still best option for this stock
- Update on rebuilding in fall
- Future work
 - Focus on Q – random walk or time blocks
