

Appendix I8: Survey Characteristics from the "18" Scenarios

William Stockhausen

31 August, 2018

Model-estimated survey characteristics such as catchability, selectivity functions, and capture probability are presented in this section.

Survey catchability

“Catchability” here refers to the catchability of crab in a “fully-selected” size bin.

Figure 1: Survey catchabilities for NMFS.

Survey selectivity functions

Survey selectivity functions reflect size-specific catchability relative to a “fully-selected” size class.

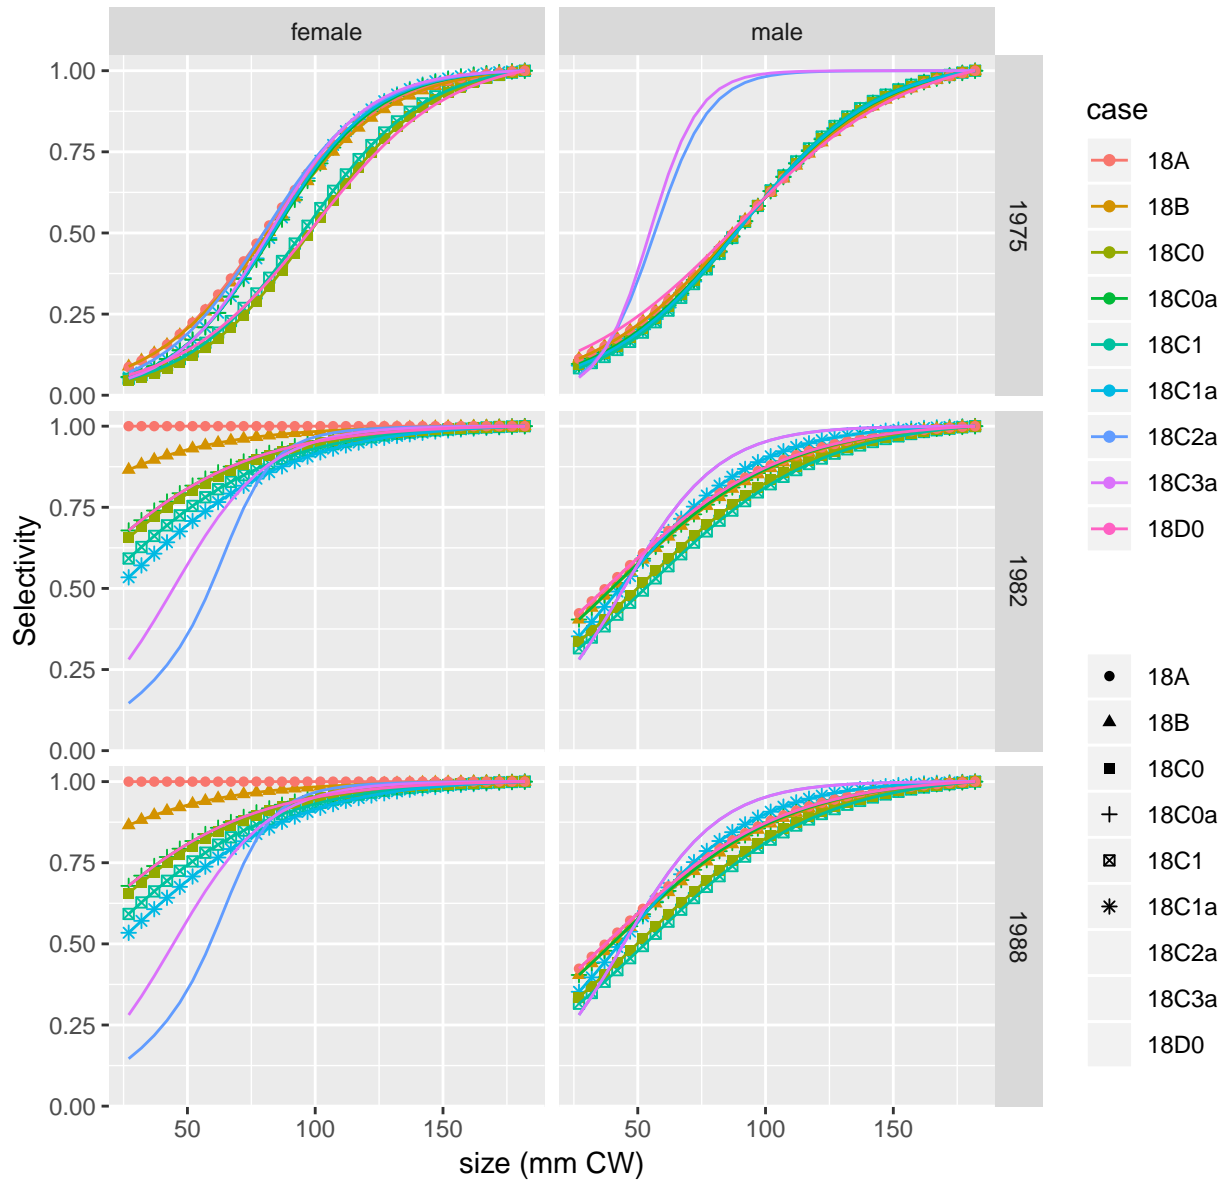

Figure 2: NMFS survey selectivities.

Survey capture probability functions

Survey capture probability functions incorporate both catchability and size-specific selectivity.

Figure 13 Capture probabilities for NMFS surveys.
