

rollovers would still facilitate a significant portion of the Pacific cod B season. Though improbable, a partial loss of the cod season represents the worst of the foreseeable scenarios in a high PSC year. That outcome would not be significantly improved by 50 additional Chinook PSC, and it is not clearly worse than the combination, in every year, of a rush to finish the RP season early and the extra challenge of managing the RP fishery to a 50 Chinook PSC seasonal limit under Option 1. Second, selecting Option 2 would comport with the Agency's preference for a marginally more manageable RP CV sector between October 1 and November 15. While it is small in terms of active vessels, managing that fishery with 50 Chinook PSC could have the real effect of closing the sector after only one small Chinook encounter; even if some of the 50 Chinook allowance remains, NMFS might have to close the fishery based on projected PSC rates and the number of vessels active. Option 2 might also mitigate a further time shift in RP effort, where late-season vessels might rush to complete their RP harvest before October 1.

The PPA allows any of the held-back Chinook PSC that is not used in the post-rollover RP CV sector to be used in the other fall fisheries after November 15. Chinook PSC in the non-RP CV sector is typically low after November 15. The CV fleet's Chinook PSC during that time has averaged around 40 fish, with one high-PSC year of 100, and two years where no salmon were taken after mid-November. Judging from the historical period, the sector might expect to have around 500 to 800 PSC remaining in its apportionment in mid-November. This portion of the non-pollock CV fishery, which has accounted for between 0.4% and 2.3% of annual first wholesale value from the fishery, would likely be sustained by the sector's remaining PSC apportionment and the expected November rollover in all but the most unusual years.
