# C-6 BSAI Halibut ABM <br> October 2018 Council meeting 

## Actions to date by Council on BSAI Halibut ABM PSC limits and projected future timeline

## 2015-2016 <br> -Council initiates iterative discussion papers evaluating a range of potential indices to index BSAI halibut PSC

## 2017-2018

-Council begins to draft a suite of Alternatives for analysis, note this is an iterative process with multiple discussion papers on aspects of the alternatives (Control rules, Indices)
-Council selects two indices for indexing abundance: NMFS EBS
Bottom Trawl survey and IPHC Setline survey in 4ABCDE
-NMFS determines the analysis will be an EIS and conducts scoping; Scoping report presented to Council April 2018

## October 2018

-Review of draft Alternatives for analysis; revise alternatives as needed

October 2019
$\bullet$ Review of draft EIS/RIR and reccomends for public release

- Council may select a preliminary prefrred alternative (PPA) at that time

April 2020

- Council takes final action on EIS/RIR

Alternatives

## Alternative 1 (Status Quo)

Current PSC limit
Amendment 80 cooperatives
1,745 t
BSAI trawl limited access fisheries 745 t
Longline fisheries
710 t
CDQ fisheries 315 t
TOTAL
3,515 t

## Alternative 2: <br> Index trawl PSC limit to EBS trawl survey biomass. Index longline PSC limit to setline survey biomass.

Alternatives 3, 4, 6
Index trawl gear PSC limit and fixed gear PSC limit to both EBS trawl survey (primary index for trawl, secondary index for longline) and setline survey (primary index for longline, secondary index for trawl).

Trawl PSC Alternative 4

Trawl PSC Alternative 6

Cross-section at trawl index $=1$ (Alt 6)

## Alternative 5 (Fixed gear only):

 Index fixed gear PSC to combination of IPHC Area 4 all sizes survey and EBS shelf trawl survey.LL PSC Alternative 5 (w/floors and ceilings)

Standardized EBS Shelf Trawl Survey

|  |  | <1.1 and > |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | > 1.1 | PSC limit = Ceiling | PSC limit = Ceiling | Does PSC limit equal the Ceiling or the Floor? |
|  | $\begin{gathered} <1.1 \text { and }>= \\ 0.5 \end{gathered}$ | $\begin{gathered} \text { PSC limit }= \\ \text { Ceiling } \\ \hline \end{gathered}$ | $\begin{gathered} \text { PSC limit }= \\ \text { Starting } \\ \text { Point } \\ \hline \end{gathered}$ | $\begin{gathered} \text { PSC limit }= \\ \text { Floor } \\ \hline \end{gathered}$ |
|  | $<0.5$ | Does PSC limit equal the Ceiling or the Floor? | $\begin{gathered} \text { PSC limit }= \\ \text { Floor } \end{gathered}$ | PSC limit $=$ <br> Floor |

# Historical Examples of Alternatives 2, 4, and 6 

## SSC Meeting, October 2018

## Background to understand the historical examples

- Examples shown only for Alt 4 because Alt 3 and Alt 4 are equivalent under our conditions
- It is impossible to make scenarios to directly compare Alt 4 and Alt 6, but we show what we did to standardize the scenarios to the extent possible
- Alternative 5 is not included in examples: further clarification needed

## Alternative 3 and Alternative 4

Both: Index trawl gear PSC and fixed gear PSC to both EBS trawl survey (primary index for trawl, secondary index for longline) and setline survey (primary index for longline, secondary index for trawl).

## Alternative 3:

The secondary index modifies a multiplier on the starting point of the control rule when the secondary index is in a "high state" or a "low state" (e.g., the PSC is multiplied by 1.1 when the secondary index is at a "high" value and by 0.9 when the secondary index is a "low" value).

Alternative 4: The secondary index modifies the multiplier on the final PSC limit after the primary index is applied when the secondary index is in a "high state" or a "low state"

## Alternatives 3 and 4 are the same under our conditions, which are:

- $1: 1$ \% change in index: \% change in PSC limit (a slope of 1)
- The primary index is standardized to its 2016 value and the starting point is the 2016 PSC limit.

## Alternatives 3 and 4 are the same under our conditions

- $1: 1$ \% change in index: \% change in PSC limit (a slope of 1 )
- The primary index is standardized to its 2016 value and the starting point is the 2016 PSC limit.

Therefore, Alternative 2 is a linear control rule passing through the point

Note that the y-axis scale here is relative to the starting point

Alternatives 3 and 4 are the same under our conditions

So we have: $\left(I_{y}, \frac{P S C_{y+1}}{X}\right)=(1,1)$

## Alternatives 3 and 4 are the same under our conditions

So we have: $\left(I_{y}, \frac{P S C_{y+1}}{x}\right)=(1,1)$

- Stating Alternative 2 using point-slope form for a line $(y-y 1)=a(x-x 1))$ :

$$
\frac{P S C_{y+1}}{X}-1=a\left(I_{y}-1\right)
$$

## Alternatives 3 and 4 are the same under our conditions

So we have: $\left(I_{y}, \frac{P S C_{y+1}}{x}\right)=(1,1)$

- Stating Alternative 2 using point-slope form for a line $(y-y 1)=a(x-x 1))$ :

$$
\frac{P S C_{y+1}}{X}-1=a\left(I_{y}-1\right)
$$

- Rearranging into slope-intercept form ( $\mathrm{y}=\mathrm{ax}+\mathrm{b}$ ):

$$
\frac{P S C_{y+1}}{X}=a I_{y}+(1-a)
$$

## Alternatives 3 and 4 are the same under our conditions

So we have: $\left(I_{y}, \frac{P S C_{y+1}}{x}\right)=(1,1)$

- Stating Alternative 2 using point-slope form for a line $(y-y 1)=a(x-x 1))$ :

$$
\frac{P S C_{y+1}}{X}-1=a\left(I_{y}-1\right)
$$

- Rearranging into slope-intercept form ( $y=a x+b$ ):

$$
\frac{P S C_{y+1}}{X}=a I_{y}+(1-a)
$$

$a=1$, and $b=1-a=0$ and so Alternative 2 is:

$$
\frac{P S C_{y+1}}{X}=I_{y}
$$

## Alternatives 3 and 4 are the same under our conditions

Alternative 2 is:

$$
\frac{P S C_{y+1}}{X}=I_{y}
$$

## Alternatives 3 and 4 are the same under our conditions

Alternative 2 is:

$$
\frac{P S C_{y+1}}{X}=I_{y}
$$

Alternative 3 is like Alt 2, but applies a multiplier to the starting point:

$$
P S C_{y+1}=I_{y}(m X)
$$

## Alternatives 3 and 4 are the same under our conditions

Alternative 2 is:

$$
\frac{P S C_{y+1}}{X}=I_{y}
$$

Alternative 3 is like Alt 2, but applies a multiplier to the starting point:

$$
P S C_{y+1}=I_{y}(m X)
$$

Alternative 4 is like Alt 2, but applies a multiplier to the PSC:

$$
P S C_{y+1}=m\left(I_{y} X\right)
$$

And Alternative 3 = Alternative 4 .

## Multipliers in our examples were chosen such that:

- A particular percent difference between the secondary index value and its breakpoint (whether above the upper breakpoint H or below the lower breakpoint L) would lead to the same percent difference (positive or negative) in the PSC limit from what it would have been without the application of a multiplier effect applied. The math is in the appendix to show that for Alt 6 this means:

For Alt 4: Iow multiplier $=1-x$, high multiplier $=1+x$ (e.g. 0.75 and 1.25)
For Alt 6: High multiplier = Low multiplier

## Comparing Alternatives 4 and 6 (arbitrary choices required):

- Alternative 4 and 6 multipliers cannot be directly compared
- When the secondary index is in a "low" or "high" state, we chose for Alternative 6 PSC limits to equal those for Alternative 4 when:
(1) the secondary index was $50 \%$ above or below its average value,
(2) the low and high breakpoints used are $25 \%$ below and above the average value for the secondary index, respectively, and
(3) the primary index is equal to 1 (its 2016 value).

## Comparing Alternatives 4 and 6

Longline PSC at LL index $=1$

## Historical Examples

## Base case: trawl, comparing Alts 2, 4, and 6

## Exploring additional scenarios:

- A 3-year moving average used for the indices
- Multipliers when secondary index is in a high or low state are 0.9 and 1.1 (instead of 0.5 and 1.5)
- Breakpoints defining when the secondary index is in a low or high state are $25 \%$ above or below the average value for the index (instead of the $2^{\text {nd }}$ highest and lowest values of the index)

## Percent change from the previous year in the trawl index vs percent change from the previous year in PSC limit for trawl sector

## Percent change from the previous year in the longline index vs percent change from the previous year in PSC limit for longline sector

Default Options

End

## Alternative 3 and Alternative 4

Multiplier influences the starting point and slope (final PSC limit)

Multiplier influences the starting point only
