October 1991

EXECUTIVE SUMMARY

The following is a summary of conclusions presented in this report. All numbers given are estimated total abundance of crabs, plus or minus a percentage which represents an approximate confidence interval of 95%. All estimates were compared to those of the previous year by t-test, and values of t greater than 2 were considered significant. Note that for some groups of crabs, especially blue king crabs, the variance of the data, as indicated by the confidence interval, is so great that large changes from last year may not be deemed statistically significant. Such changes are considered to be below the ability of the survey to detect. GHL = Guideline Harvest Level, as determined by the Alaska Dept. of Fish and Game.

Questions about these data, should be directed to Dr. Bradley G. Stevens or Dr. Robert Otto, NMFS, P.O. Box 1638, Kodiak, AK 99615. Phone (907) 487-4961.

Red king crab (*Paralithodes camtschaticus*) All districts combined.

Legal males:	12.0 million \pm 36%; Non-significant increase of 29%.
Pre-recruits:	No significant change.
Large Females:	Non-significant decrease of 28%.
Outlook:	Population remains stable at moderate levels.
GHL:	18.0 million lbs.

Pribilof Islands blue king crab (*P. platypus*) Pribilof District.

Legal males:	1.0 million \pm 70%; Non-significant increase of 147%.
Pre-recruits:	No significant change.
Large Females:	No significant change.
Outlook:	Population low but may be increasing; trends not detectable.
GHL:	Fishery closed for 1991.

St. Matthew blue king crab (*P. platypus*) Northern District.

Legal males:	2.17 million \pm 35%; Non-significant increase of 31%.
Pre-recruits:	Non-significant increase of 100%
Large Females:	Non-significant increase of 250%.
Outlook:	Population appears average and stable or increasing.
GHL:	3.2 million lbs.

Tanner crab (*Chionoecetes bairdi*) Eastern District.

Legal males: 35.1 million \pm 35%; Non-significant decrease of 22%.
Pre-recruits: (All districts) Non-significant increase of 37%.
Large Females: (All districts) Non-significant increase of 27%.
Outlook: Population moderately high and stable.
Expect continued high recruitment in future.
GHL: 32.8 million lbs.

Snow crab (*C. opilio*) All districts combined.

Large males: 484.1 million \pm 29%; Non significant increase of 15%.
Pre-recruits: Significant decrease of 32%.
Large Females: Non-significant increase of 28%.
Outlook: Overall population high and stable. High recruitment due to growth of pre-recruits into large sizes.
GHL: 400.0 million lbs.

Hair crab (*Erimacrus isenbeckii*)

Large males: 0.65 million \pm 57%; Non-significant increase of 18%.
Large Females: No significant change.
Outlook: Population above average and improving due to recent recruitment.
GHL: None Projected.

The 1991 Eastern Bering Sea Survey

An annual trawl survey is conducted in the eastern Bering Sea (EBS) to determine the distribution and abundance of crab and groundfish resources. This report summarizes survey results for commercially important crabs. It is intended to aid fishermen and processors in locating productive grounds and judging overall availability of various species. Survey-derived data are also used as part of the basis for management decisions. Results are presented for red king crab (*Paralithodes camtschaticus*), blue king crab (*P. platypus*), hair crab (*Erimacrus isenbeckii*), Tanner crab (*Chionoecetes bairdi*) and snow crab (*C. opilio*). Information on groundfish resources is available from the Alaska Fisheries Science Center, 7600 Sand Point Way NE, BIN C15700, Seattle, Washington 98115.

Survey Area and Methods

The 1991 eastern Bering Sea (EBS) crab survey consisted of 372 successful bottom trawl tows and covered an area of approximately 146,000 square nautical miles. The 1991 survey area was similar to that of 1990 (Fig. 1). The survey was conducted aboard two chartered vessels, the F/V Ocean Hope 3 and the University of Washington's R/V Alaska between June 1 and August 7. The same two vessels were used in 1988, 1989, and 1990. Methodology was identical to that of previous surveys; most tows were made at the centers of squares defined by a 20 x 20 nautical mile grid. Near St.

Matthew Island and the Pribilofs, additional tows were made at the corners of squares. Trawl gear used was similar to that used last year.

Both vessels fished an eastern otter trawl with an 83 ft headrope and a 112 ft footrope. Wing spread on this trawl ranges from 47 - 58 feet. For consistency with previous reports an effective width of 50 feet was used. Each tow was one-half hour in duration; average length was 1.4 nautical miles (range 0.5 to 2.3). Crabs were sorted by species and sex, and then a sample of crabs was measured (to the nearest millimeter) to provide a size frequency distribution. Note that crab sizes are reported as carapace length (cl) for king and hair crabs, and carapace width (cw) for Tanner and snow crabs. Water temperatures were recorded at almost all stations.

Additional tows were made in shallow water near Togiak (2 tows) and Kuskokwim Bay (2 tows) where high catches of yellowfin sole have recently occurred. Repeat tows were made at several stations where high catches of red king crab occurred; these included F05, F07, G05, and G06. Crab data from all extra stations are incorporated into population estimates.

Procedures for estimating abundance were identical to those of previous years. Population estimates (Tables 1-6) were derived from the trawl data using the "area-swept" technique. First, the density of crabs (crabs per square nautical mile) at each trawl station was computed. Average density

Figure 1. NMFS eastern Bering Sea Crab survey area in 1990 and 1991.

was then calculated for several sub-regions, then population estimates were calculated by extrapolating the average density of a given size group over the area of each subregion.

The following abbreviations are used in the text: (in) inches, (mm) millimeters, (fm) fathoms, (lb) pounds, (°C) degrees Celsius, (cl) carapace length, and (cw) carapace width.

Interpreting Tables and Charts

Because of differences in the length of tow between vessels and stations, catches presented in accompanying charts and tables are standardized to the number of crab caught per square nautical mile. Charts are based on 20 by 20 nautical mile squares. In cases where more than one tow was made in a square (including corner tows), the average crab density is presented. It is advisable to cross-reference charts and tables to obtain more exact information.

Distribution and Abundance of King Crab Stocks

Red King Crab

The majority of the legal (≥ 6.5 in cw, ≥ 135 mm cl) male crabs occurred in Bristol Bay (Area T; Chart 1 and Table 7), and their overall distribution was similar to that of 1990. A few red king crabs were also found near the Pribilof Islands and in the Northern District (north of $58^{\circ}39'N$ lat.), but their contribution to overall abundance in the EBS is negligible.

One of the highest catches of legal crabs in the history of the survey (423) occurred at station F06. This extremely unusual catch was excluded from the abundance estimate because it was not considered to be representative of the population. The estimated abundance of legal male red king crabs in the Bristol Bay District (south of $58^{\circ}39'N$ lat and east of $168^{\circ}W$ long) and the Pribilof District (south of $58^{\circ}39'N$ lat and west of $168^{\circ}W$ long) was 12.0 million crabs which represents a non-significant¹ increase of 29% from last year (Table 1). Pre-recruit crab (110-134 mm cl) and juveniles showed no significant change. The abundance of legal males has remained relatively stable for several years, but recruitment of juveniles has been poor, and numbers of small male crab are at an all-time low (Table 1; Fig. 2).

Legal male crabs were found between 15 and 50 fm (average 38.4 fm) and from 1.3 to $5.4^{\circ}C$ (average $2.4^{\circ}C$). Legal crab were occasionally found as solitary individuals at the periphery of the stock's distribution. Less than 0.1% of male crabs were in molting or soft-shell condition (vs 0.1% last year). Among legal-sized crab, 16.1% were oldshell, skipmolt crabs (vs 44.2% last year). Molting of male crabs appears to have been completed prior to the survey.

The estimated abundance of large² (≥ 90 mm cl) females in the Bristol Bay and Pribilof Districts showed a non-significant decrease of 28% from last year and now stands at 12.7 million crabs. The estimated abundance of small females showed a non-significant decrease of 34%. In June, 5.1% of mature females were still molting or soft-shell, (vs

1. "Significant" is a statistical term implying that the difference between two abundance estimates has a 95% chance or more of being real, rather than simply the result of chance. Generally, stocks or populations which are less abundant or occur at fewer locations, such as blue king crab or hair crab, have greater variance, so large differences may appear to be non-significant. Comparisons were made via a two-sample unpaired 't'-test, and values of t 2.0 were considered significant.

2. Throughout this report, the term "large females" refers to those females larger than the median size at maturity, i.e., the size at which 50% are mature. A small number of females above this size may actually be immature, but the majority are mature crabs which should contribute to reproduction of the population.

Table 1. Annual abundance estimates (millions of crabs) for red king crab (*P. camtschaticus*) in Bristol Bay and the Pribilof District from NMFS surveys.

Red King Crab, Bristol Bay

FIGURE 3. U.S. Landings in millions of lbs, catch-per-unit-of-effort as crabs/pot, and abundance of legal red king crabs (*P. camtschaticus*) in millions in Bristol Bay, estimated from NMFS trawl surveys.

19.7% last year). Among mature females, the proportion which had molted and extruded new, uneyed eggs was 96% compared to 97% last year. Fluctuations in the timing of molting, mating, and embryo extrusion may be related to annual variations in water temperature.

The Bristol Bay fishery will open on November 1, 1991 with a guideline harvest of 18.0 million pounds relative to an estimated stock of 72.6 ± 26.0 million pounds. Catch-per-unit-of-effort (CPUE) in recent years has ranged from 8-12 crabs per pot-lift (Fig. 3). The target exploitation rate was set at 25% of the legal male biomass, as determined according to Board of Fisheries policy.

Pribilof Islands Blue King Crab (*P. platypus*)

Legal (≥ 6.5 in, or ≥ 135 mm cl) males were found primarily to the east of St. Paul Island (Chart 2 and Table 8). Legal crab occurred at temperatures between 2.5 and 5.3°C (average 2.8°C), and at

depths between 35 and 53 fm (average 40.1 fm). The estimated abundance of legal males was 1.0 million crabs (Table 2), a non-significant increase of 147% from last year. The number of pre-recruits showed no significant change. The abundance of juveniles (< 110 mm cl), showed a non-significant decline of 28%. Size-frequency data (Fig. 4) indicate that recruitment of juveniles to larger size groups has improved, continuing a trend started in 1988. This population is still depressed (Fig. 5), but may be improving. The fishery will not be opened in 1991. Over 87% of sublegal males and 72% of legal males were in new, hardshell condition, the remainder being oldshells.

The estimated abundance of large (≥ 90 mm cl) females showed a non-significant change from last year's level. Historically, estimates of female abundance have been imprecise due to the preference of females for rocky habitat which is not sampled well by trawls. Among mature females, 61% were

Blue King Crab, Pribilof District

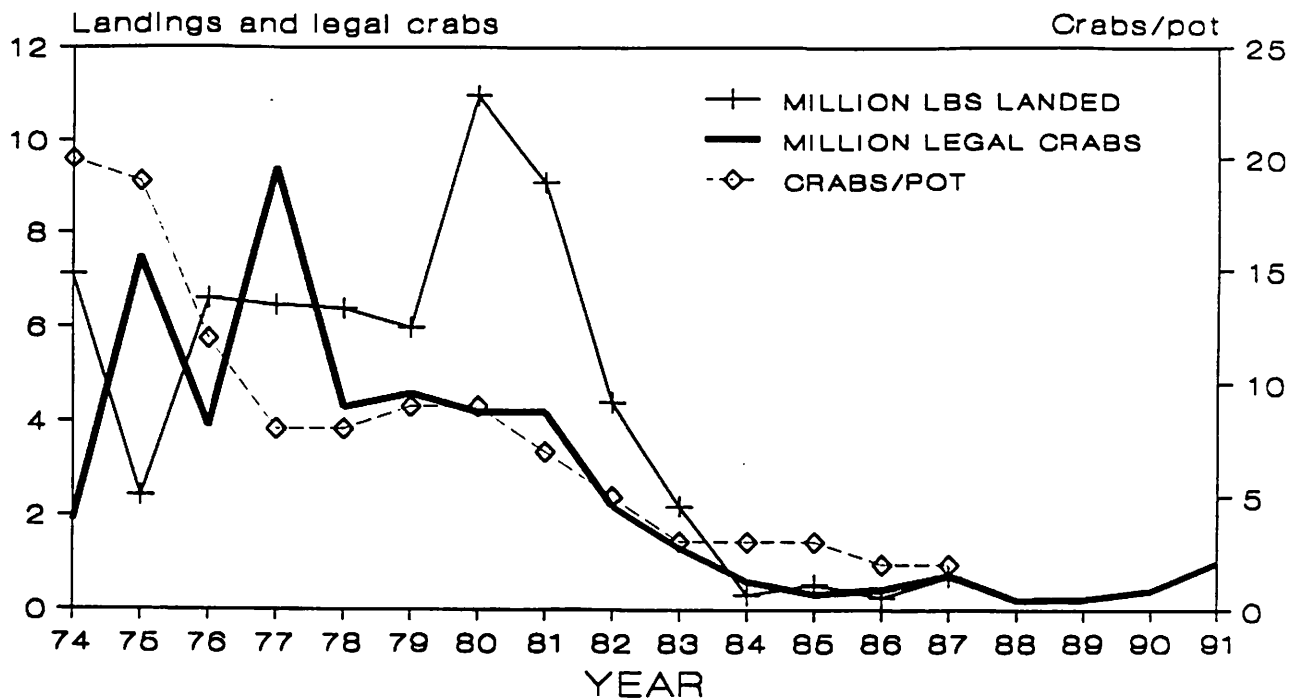

FIGURE 5. U.S. landings in millions of lbs, catch-per-unit-of-effort (CPUE) as abundance of legal blue king crabs (*P. platypus*) in millions in the Pribilof District, estimated from NMFS trawl surveys.

new hardshells, and 39% oldshells. Blue king crab are predominantly biennial spawners. Only a portion of the female population spawns in a given year, while the remainder is in the non-embryo-bearing phase. Among mature females, 43% carried new, uneyed embryos and 40% carried empty embryo cases indicating hatching had recently occurred. Less than 1% of males, and no females were in molting or soft-shell condition, indicating that molting was completed for 1991.

St. Matthew Island Blue King Crab (*P. platypus*)

Legal (≥ 5.5 in cw, or ≥ 120 mm cl) males occurred primarily southwest of the island (Chart 2 and Table 8) and were captured at 26 stations in 1991. (vs 12 last year). Legal males were found in depths from 25 to 71 fm (average 50.1 fm) and

temperatures from -1.5 to 2.3°C (average 0.7°C). The estimated abundance of legal crabs was 2.2 million crabs (Table 3), a non-significant increase of 31% from last year. The abundance of both pre-recruits and juveniles showed a non-significant increases of 100%. Size-frequency data (Fig. 6) show that pre-recruits have grown into the legal size range over the past year. The population appears stable and may be increasing slightly. The abundance of large females (≥ 80 mm cl) showed a non-significant increase of 250% but estimates of female abundance are usually imprecise, and may be low due to habitat preference, as explained above. Among legal males, 19% were molting or softshell, 64% were new hardshells, and 16% oldshells. All 16 mature females were hardshell crabs; 11 (69%) showed signs of recent hatching, and one (6%) was carrying new uneyed embryos.

1 Carapace length (mm), categories reflect smaller average size in the Northern District; 80 mm is the median size at maturity for females

2 Mean ± 2 standard errors for most recent year.

The 1991 fishery opened on September 1 with a guideline harvest of 3.2 million pounds out of an estimated stock of 8.1 million lbs. The target exploitation rate was 40% of the legal male biomass. In 1990, 31 vessels landed 1.7 million pounds, with an average CPUE of 8 crabs per pot-lift³. Preliminary information indicates that 1991 landings were very close to the guideline (Bill Nippes, ADF&G, 211 Mission Road, Kodiak, AK 99615, pers. commun., September 1991).

Distribution and Abundance of Tanner Crab (*C. bairdi*)

Although the legal minimum size of 5.5 in cw is equivalent to 140 mm cw, legal crabs are defined in this report as ≥ 138 mm cw because of the difference between scientific measure (between spines) and commercial measure (spine tip to spine tip). The data included in Table 4, however, show

Blue King Crab: Northern District

FIGURE 7. U.S. landings in millions of lbs, catch-per-unit-effort (CPUE) as crabs/pot, and the abundance of legal blue king crabs (*P. platypus*) in millions in the Northern District, estimated from the NMFS trawl surveys.

“large” crabs as males ≥ 135 mm, because this is closer to the lower limit of sizes landed, and has been used for a long-term index since 1976.

Large males were widely distributed in Bristol Bay and continental slope areas with regions of relatively high abundance in mid-Bristol Bay and the Pribilof Islands (Chart 3 and Table 9). Legal crab were found from 18 to 97 fm (average 42.2 fm) and at temperatures ranging from -0.8 to 5.5°C with an average temperature of 3.0°C . The estimated abundance of large (≥ 135 mm cw) male *C. bairdi* in the Eastern District is 45.5 million crabs (Table 4), of which 35.1 million are legal size (≥ 138 mm cw). About 72% of the legal crab were located east of 166°W long. The Eastern District (east of 173°W long.) includes 99.8% of legal males. Note that, prior to 1989, all estimates were presented for the combined Bristol Bay and Pribilof Districts, which

included 98.4% of large males in 1988. The estimated total abundance of legal crabs showed a non-significant decrease of 22% from last year. The estimated abundance of pre-recruits (110-134 mm cw) showed a non-significant increase of 37%, and the estimate of small males (< 110 mm cw) showed no significant change. This population appears fairly stable at a high level of abundance. Changes in abundance in the past few years may simply be due to imprecision in the survey. Size-frequency data (Fig. 8) show a strong cohort of pre-recruits, many of which may grow into the legal size category next year. A relatively small proportion (8%) of legal males were molting or softshell, whereas new hardshells comprised 58%, and oldshells were 33%.

The abundance of large (≥ 85 mm cw) females (all districts) showed a non-significant increase of 27%, and the abundance of small (< 85 mm

females showed no significant change from last year. Only 21% of mature females were new hardshells, whereas 78% were oldshells, and <2% were molting or softshell. This is additional evidence that recruitment is slowing as this population nears peak abundance. About 98% of mature females were carrying new, uneyed embryos, suggesting that the period of larval hatching and embryo extrusion was essentially completed by the time of the survey.

The harvest guideline for 1991-92 has been set at 32.8 million lbs, out of an estimated 82.3 ± 29.0 millions lbs. available, for an exploitation rate of 40%. In 1990 about 40.1 million pounds were harvested³ by 255 vessels, with average CPUE of 19

crabs/pot-lift(Fig.9)(Ken Griffin, ADF&G, P.O. Box 308, Dutch Harbor, AK 99692, pers. commun., September 1991).

Distribution and Abundance of Snow crab (*C. opilio*)

Although the legal minimum size limit for *C. opilio* is 3.1 in cw (78 mm), processors currently prefer a minimum size of 4.0 inches (102 mm). Therefore, the size ranges for male *C. opilio* used in this report are defined as follows: sublegal, <3.1 in (<78 mm) cw; small, 3.1-4.0 in cw (78-101 mm); large, ≥4.0 in cw (≥102 mm); and very large ≥4.3 in cw (≥110 mm).

FIGURE 8. Estimates of abundance of *C. bairdi* in Bristol Bay and the Pribilof District by 5 mm width classes, 1989-1991. Vertical line indicates lower limit of legal size.

C. bairdi, Bristol Bay and Pribilofs

FIGURE 9. U.S. landings in millions of lbs, catch-per-unit-effort (CPUE) as crabs/pot, and the abundance of large male *C. bairdi* in millions in the Bristol Bay and Pribilof Districts (prior to 1989), or the Eastern District (After 1988), estimated from the NMFS trawl surveys.

The distribution of large males showed an area of high concentration northeast of the Pribilof Islands (Chart 4 and Table 10). There were also areas of high abundance in the extreme northwestern portion of the survey area west of St. Matthew Island. Crab larger than 4.0 inches were taken at depths from 24 to 97 fm (average 48.1 fm), and temperatures from -1.6 to 5.5°C (average 1.7°C).

This species has been surveyed since 1978, but the area surveyed prior to 1982 was smaller than the currently surveyed area, and previous estimates probably underestimated the exploitable crab population. Furthermore, the 4-inch (102 mm) size preference was not in use prior to 1984. For these reasons estimates of abundance of large males are not shown for years prior to 1984 (Table 5; Fig. 11).

The estimated number of large (≥ 102 mm

cw) males (Eastern and Western Districts combined) is 484.1 million crabs, a non-significant increase of 15% from last year. Small males (78-101 mm cw) showed a significant decrease of 32%, and very large males (≥ 110 mm cw) showed a significant increase of 71%. Sublegal males (< 3.1 in cw) showed a significant increase of 79%. Increases in larger size groups are primarily due to growth of pre-recruit crab, and the population also appears to have had strong recruitment of juvenile crab. The estimated abundance of large female (≥ 50 mm cw) crabs showed a non-significant increase of 28%, and small females showed a significant increase of 125%. Size-frequency data (Fig. 10) indicate that major recruitment of postlarval crab occurred in the mid-1980's, and recruitment to the fishery has improved as juveniles matured. From 1989 to 1990 a large

* Estimates not available at present time.

number of males grew about 20 mm, a larger than expected increment. It also appears that a large number of legal sized but small clawed crab grew into the large size category in 1991. In addition, strong recruitment of postlarval crab has occurred in the last few years. Recruitment patterns in this stock are not entirely clear since recruitment evidently occurs both through localized production and by immigration from unsurveyed areas, perhaps including Soviet waters. Among large male crabs in the Eastern District, 36% were in molting or softshell condition, 51% were newshells indicating a recent molt, and 13% were oldshells (these may have some scratch marks and be slightly duller than newshells, but still fairly clean). Less

than 0.1% were very oldshells (dark colored, often with wound marks and/or overgrown with barnacles and other organisms). In the Western District, 15% of large males were molting or softshells, 66% were newshells, 16% were oldshells, and 3% were very oldshells.

Almost no females were molting or softshell, indicating that the female molting period was completed. Oldshells comprised 54% of mature females in the Eastern District, and 85% in the Western District: these proportions are very similar to last year. Considering only mature female crabs, about 87% carried new uneyed embryos (vs 77% last year) indicating that hatching and extrusion were close to completion by the time of the survey.

C. opilio Width Frequency

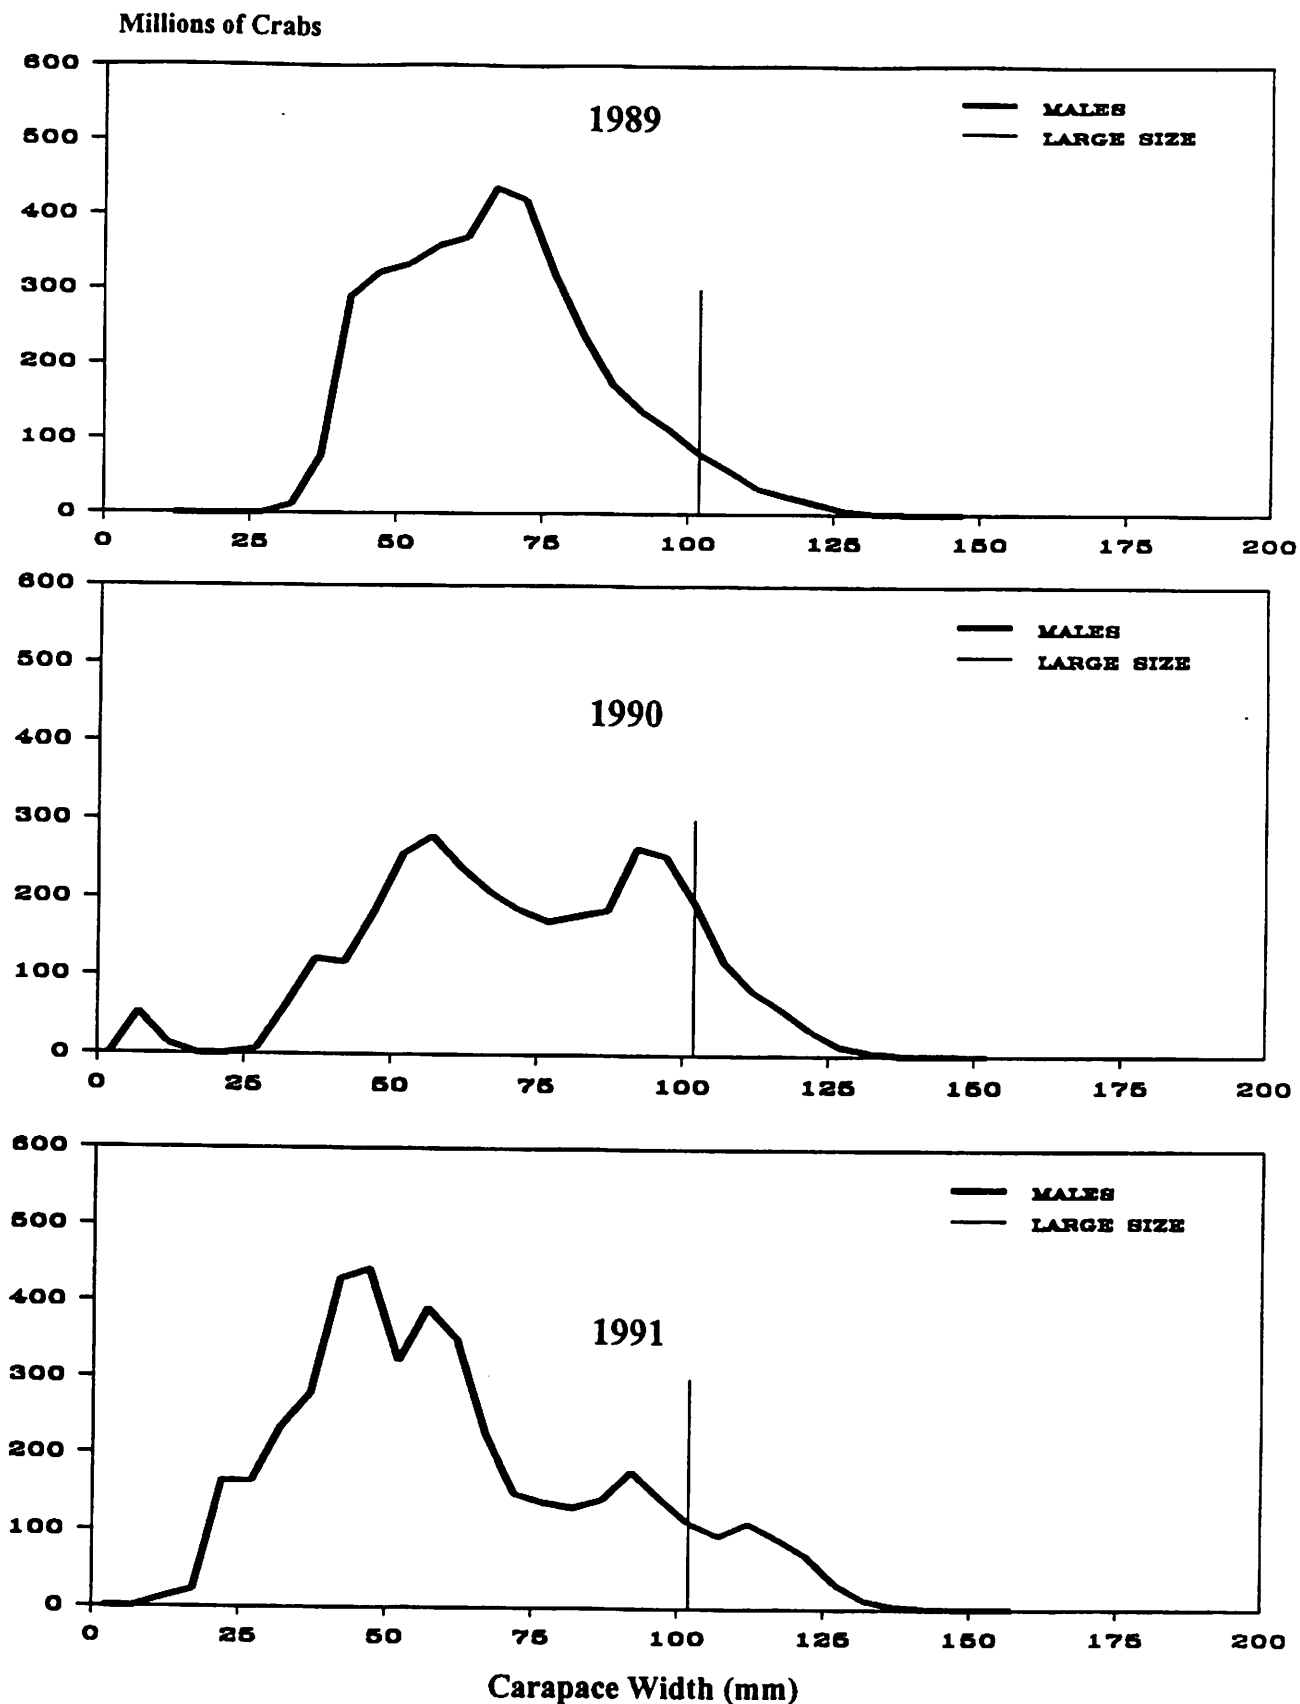

FIGURE 10. Estimates of abundance for male *C. opilio*, all districts combined by 5 mm width classes, 1989-1991. Vertical line indicates minimum size preferred by industry.

C. opilio, All Districts

FIGURE 11. U.S. landings in million of lbs, catch-per-unit-effort (CPUE) as crabs/pot, and the abundance of large male (≥ 102 mm cw) *C. opilio* in millions (all districts combined), estimated from the NMFS trawl surveys.

The harvest guideline for 1991 has been set at 400 million lbs for large crab. Currently there are an estimated 690 (± 200) million pounds of large males (≥ 4.0 in cw) within the survey area of which 88% by weight exist east of 173°W long. Preliminary 1991 ADF&G statistics³ indicate that about 328.6 million lbs were landed (Fig. 11) by 228 vessels, with average catches of 188 crabs/pot (Ken Griffin, ADF&G, pers. commun., September 1991).

Distribution and Abundance of Hair Crab

Hair crab are widely scattered across the EBS (Chart 5 and Table 11). Areas of concentration exist immediately north of the Alaska Peninsula and near the Pribilof Islands. Large hair crab (≥ 3.5 in or ≥ 90 mm cl) were taken in 24 to 46 fm (average 32.0

fm) and at temperatures of 2.1 to 5.4°C (average 3.9°C). Large males were 100% of the catch in many areas. We have never found many female or small male crab during the survey and hence have little understanding of their distribution.

Because of their patchy distribution and low densities, estimates of abundance of hair crab are imprecise. The estimated abundance of large male hair crabs has been declining since 1981 and has been very low since 1988 (Table 6). The current estimate of 650,000 shows a non-significant increase of 18% over the past year. The estimated abundance of small (< 3.5 in cl) males shows a non-significant decrease of 62% from last year, but is still relatively high and indicative of recent strong juvenile production. The estimated abundance of total females shows a non-significant increase of 53% from last year, but this estimate is unreliable as

indicated above. Size-frequency data (Fig. 12) show improved recruitment of small male crabs in the past 3 years, and may indicate future improvement in the fishable stocks. Shell conditions for hair crab are difficult to determine, and may not be very precise. The majority of males (80%) and females (94%) were new hardshell crabs.

Landings have been largely incidental to Tanner and snow crabbing although there is occasionally some directed effort. No hair crab were landed in the last year. Currently there are an estimated 1.1 million pounds ($\pm 57\%$) of large male crabs. The fishery and markets have both been intermittent and probably will remain so in the near

future. There are no guideline harvest levels, closed seasons or size limits for hair crab. CPUE has not been predictable due to low effort in recent years (Fig. 13).

Bottom Temperatures

The average bottom water temperature in 1991 was 2.3°C as compared to 2.2°C in 1990 and 3.0°C in 1989. The coldest waters were encountered around St. Matthew Island (Chart 6). The warmest waters were found in Kuskokwim Bay and inner Bristol Bay. Most year-to-year variation in temperature is associated with relatively shallow areas of the

Table 6. Annual abundance estimates (millions of crabs) for hair crabs (*Erimacrus isenbeckii*) from NMFS surveys. The size at entry to the U.S. fishery is approximately 90 mm (3.5 in) carapace length.

continental shelf and near shore. There is little year-to-year change in the Pribilof Islands and other shelf edge areas where temperatures are moderated by incursions of deep ocean water. The effect of water temperature on changes in the distribution and abundance of crabs in the eastern Bering Sea is poorly known.

As an index of mean temperature in the area most important to larval and juvenile red king crab growth, the average temperature has been determined from the June survey data for 37 stations along the Alaska Peninsula since 1971. This coastal temperature index for 1991 was 3.61°C (Fig. 14), which is slightly above the 1971-1991 average.

Summary

In the early or mid-1980's, a major recruitment event occurred for both Tanner and snow crab. In 1990 and 1991, *C. opilio* have continued to grow, increasing the abundance of large crab. Additionally, another major cohort of juvenile *C. opilio* appears to have been produced in the late 1980's. Pribilof Island blue king crabs, as well as hair crab, have also shown improved signs of recruitment of small crab; however, lack of knowledge concerning growth rates of those two species leads to uncertainty about the timing of the event. In contrast, Bristol Bay red king crab and St. Matthew Island blue kings show little sign of recruitment, but the

Coastal Bottom Temperature Index

FIGURE 14. Coastal bottom temperature index (mean of 37 survey stations along the Alaska Peninsula in degrees C for 1971-present). Horizontal line is average value over the entire period.

survey has generally been unsuccessful in detecting such crab until they are typically 50-75 mm cl, or 5-8 years of age. Whatever conditions are responsible for such recruitment events may have been limited to the outer shelf area, where it would have affected all but the latter two stocks. Shelf and coastal water temperatures remained in the average range, as they have since 1983.

A Note on Tagging and Tag Returns

Since 1982, NMFS has tagged a number of crabs each year. These include red, blue and golden (brown) king crabs. In Bristol Bay, we tagged about 10,000 red king crabs in 1985, and several hundred each year through 1990. The purpose of our tagging program is to gather information on growth, migrations, and the frequency of molting. For this reason,

we need fairly complete information with returned tags. Tag returns are not used to monitor or close fisheries. All tagged crabs, regardless of size or sex, may be retained for the purpose of tag data recovery. The following information is requested:

1. Name and mailing address of person to receive reward
2. Tag number (one or both tags if present)
3. Length-width measurements (length - from rear of eye socket to center of rear margin of carapace; width - maximum width including spines)
4. Recovery date
5. Recovery location (Latitude and Longitude)
6. Depth
7. Vessel ADF&G number

This information will be recorded on stamped data cards and if possible validated by ADF&G biologists before being mailed to the NMFS in Kodiak. The reward will be mailed to the address on the card. Any legal male crab will remain the property of the catcher vessel.

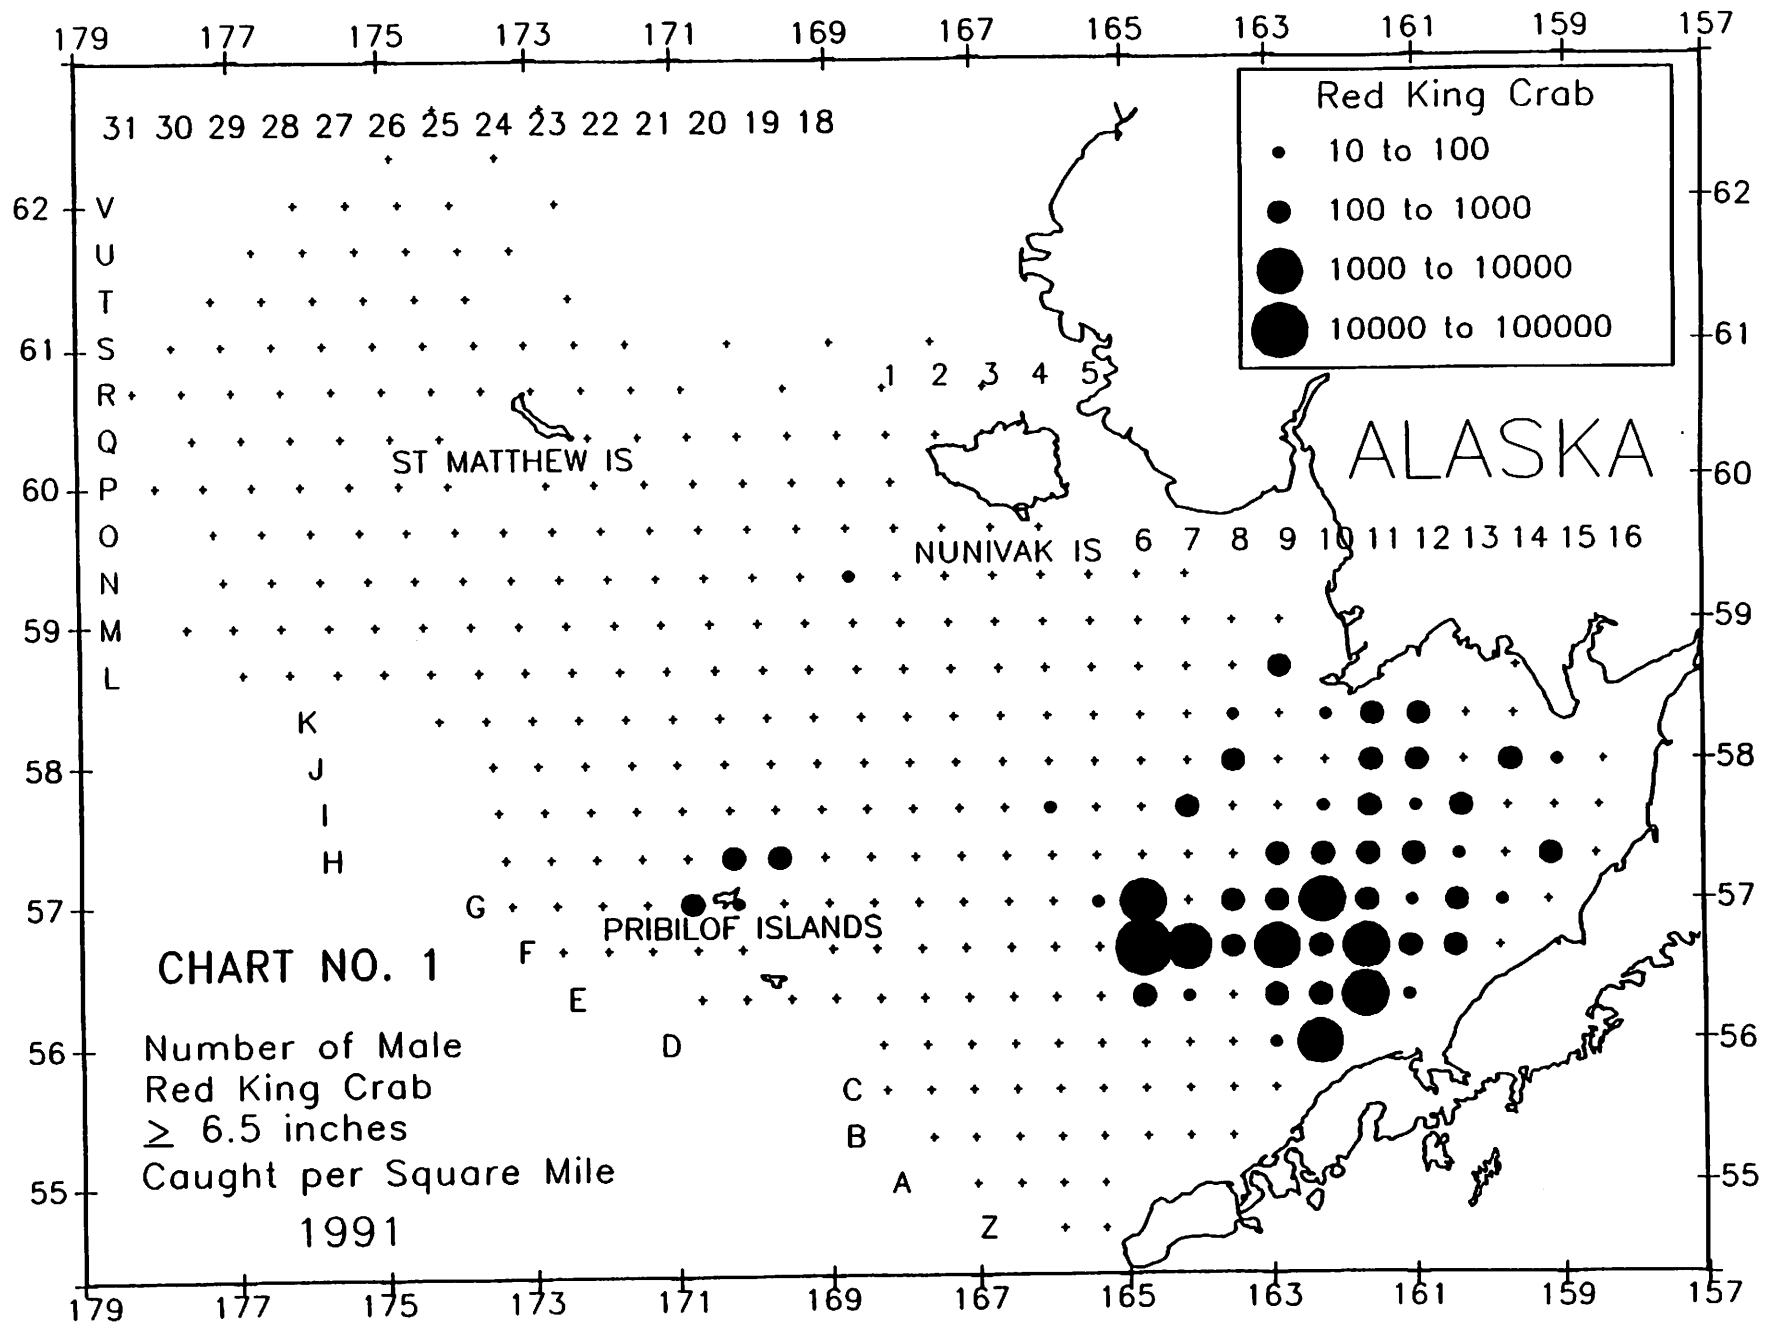

A reward of \$10.00 will be paid for all tags returned with complete information with the exception of 70 predetermined numbers. Of these 70 tags, 40 will have a reward value of \$25.00, 20 a reward value of \$50.00 and 10 a reward value of \$100.00. Tags returned without the above information will have a reward value of \$1.00.

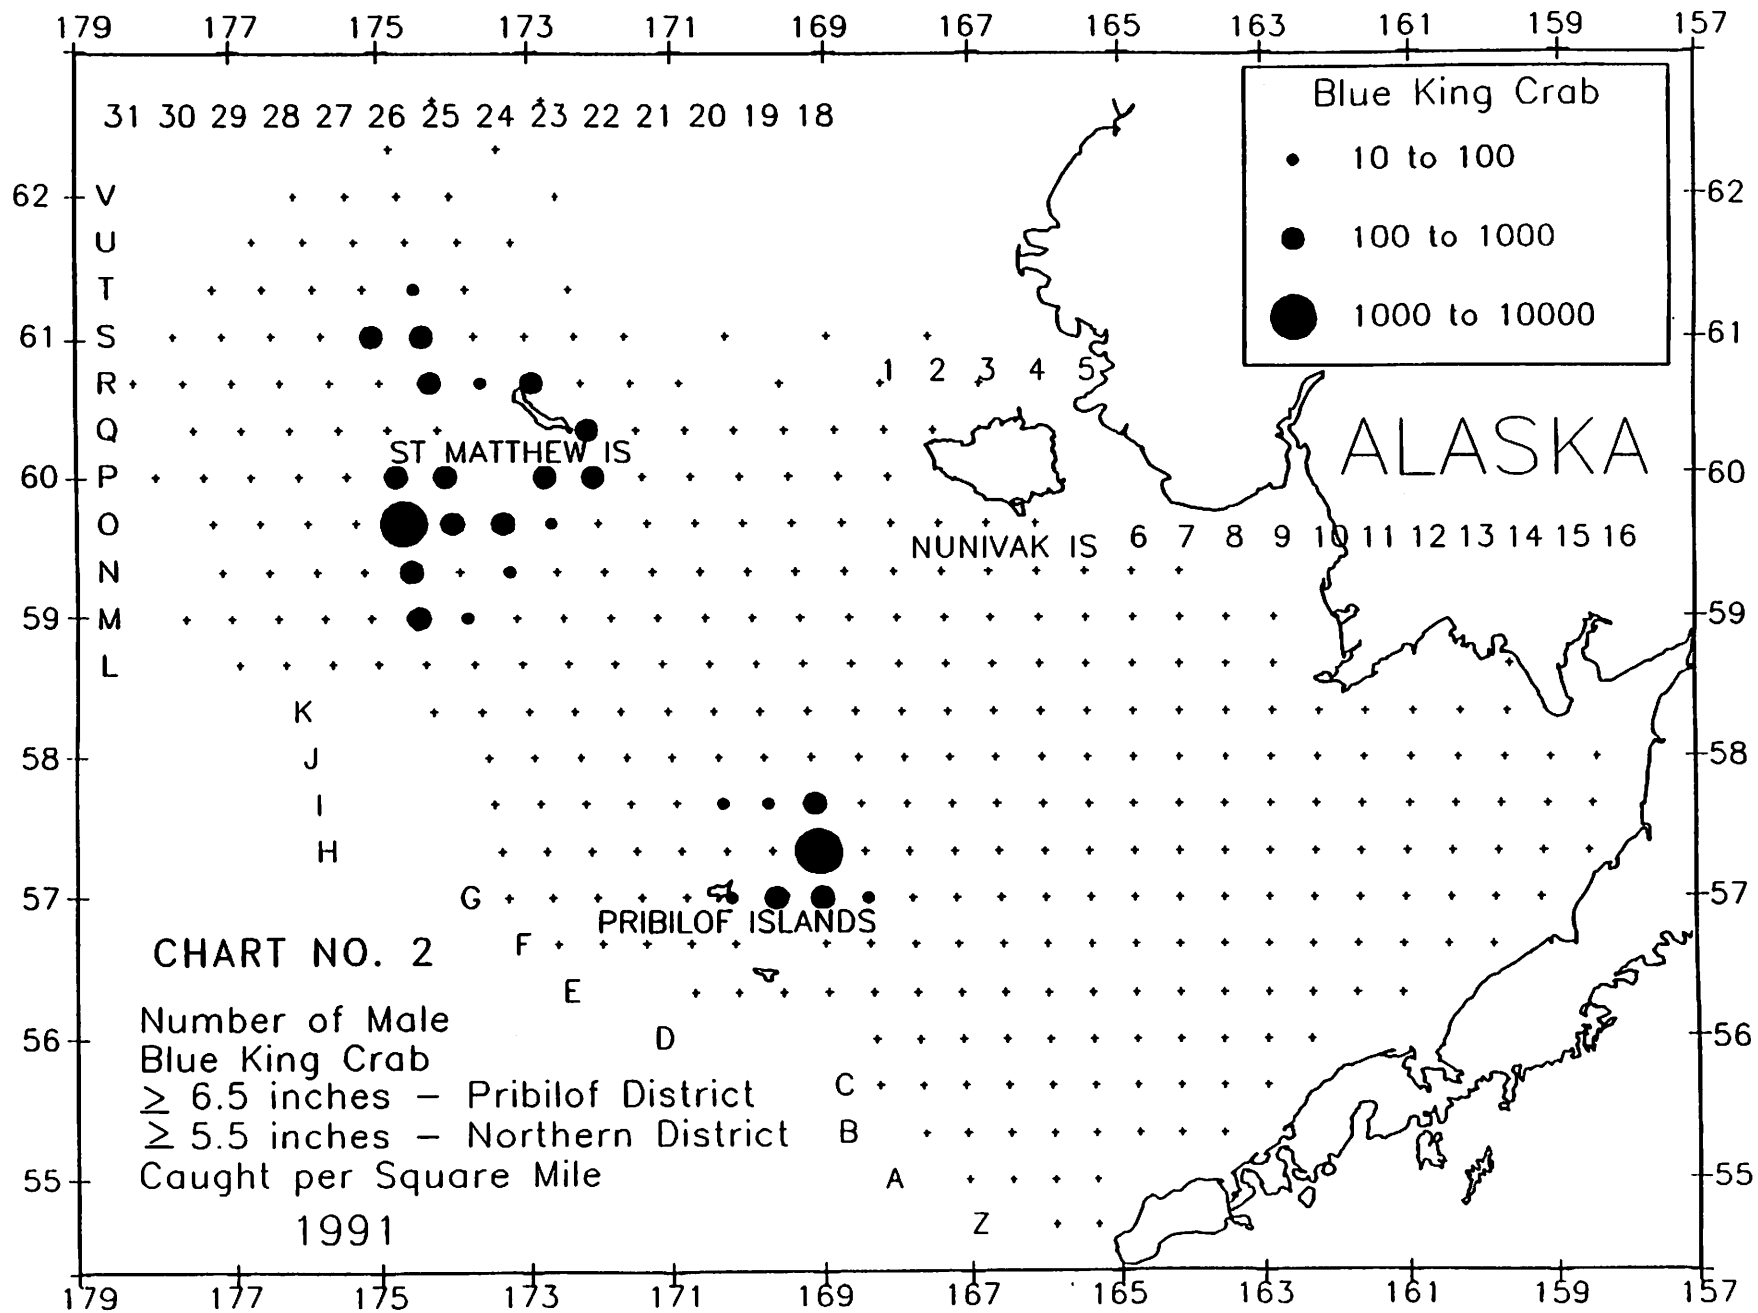

After the fishery is closed and all returns have been checked for completeness and accuracy, six of the returned numbers will be randomly

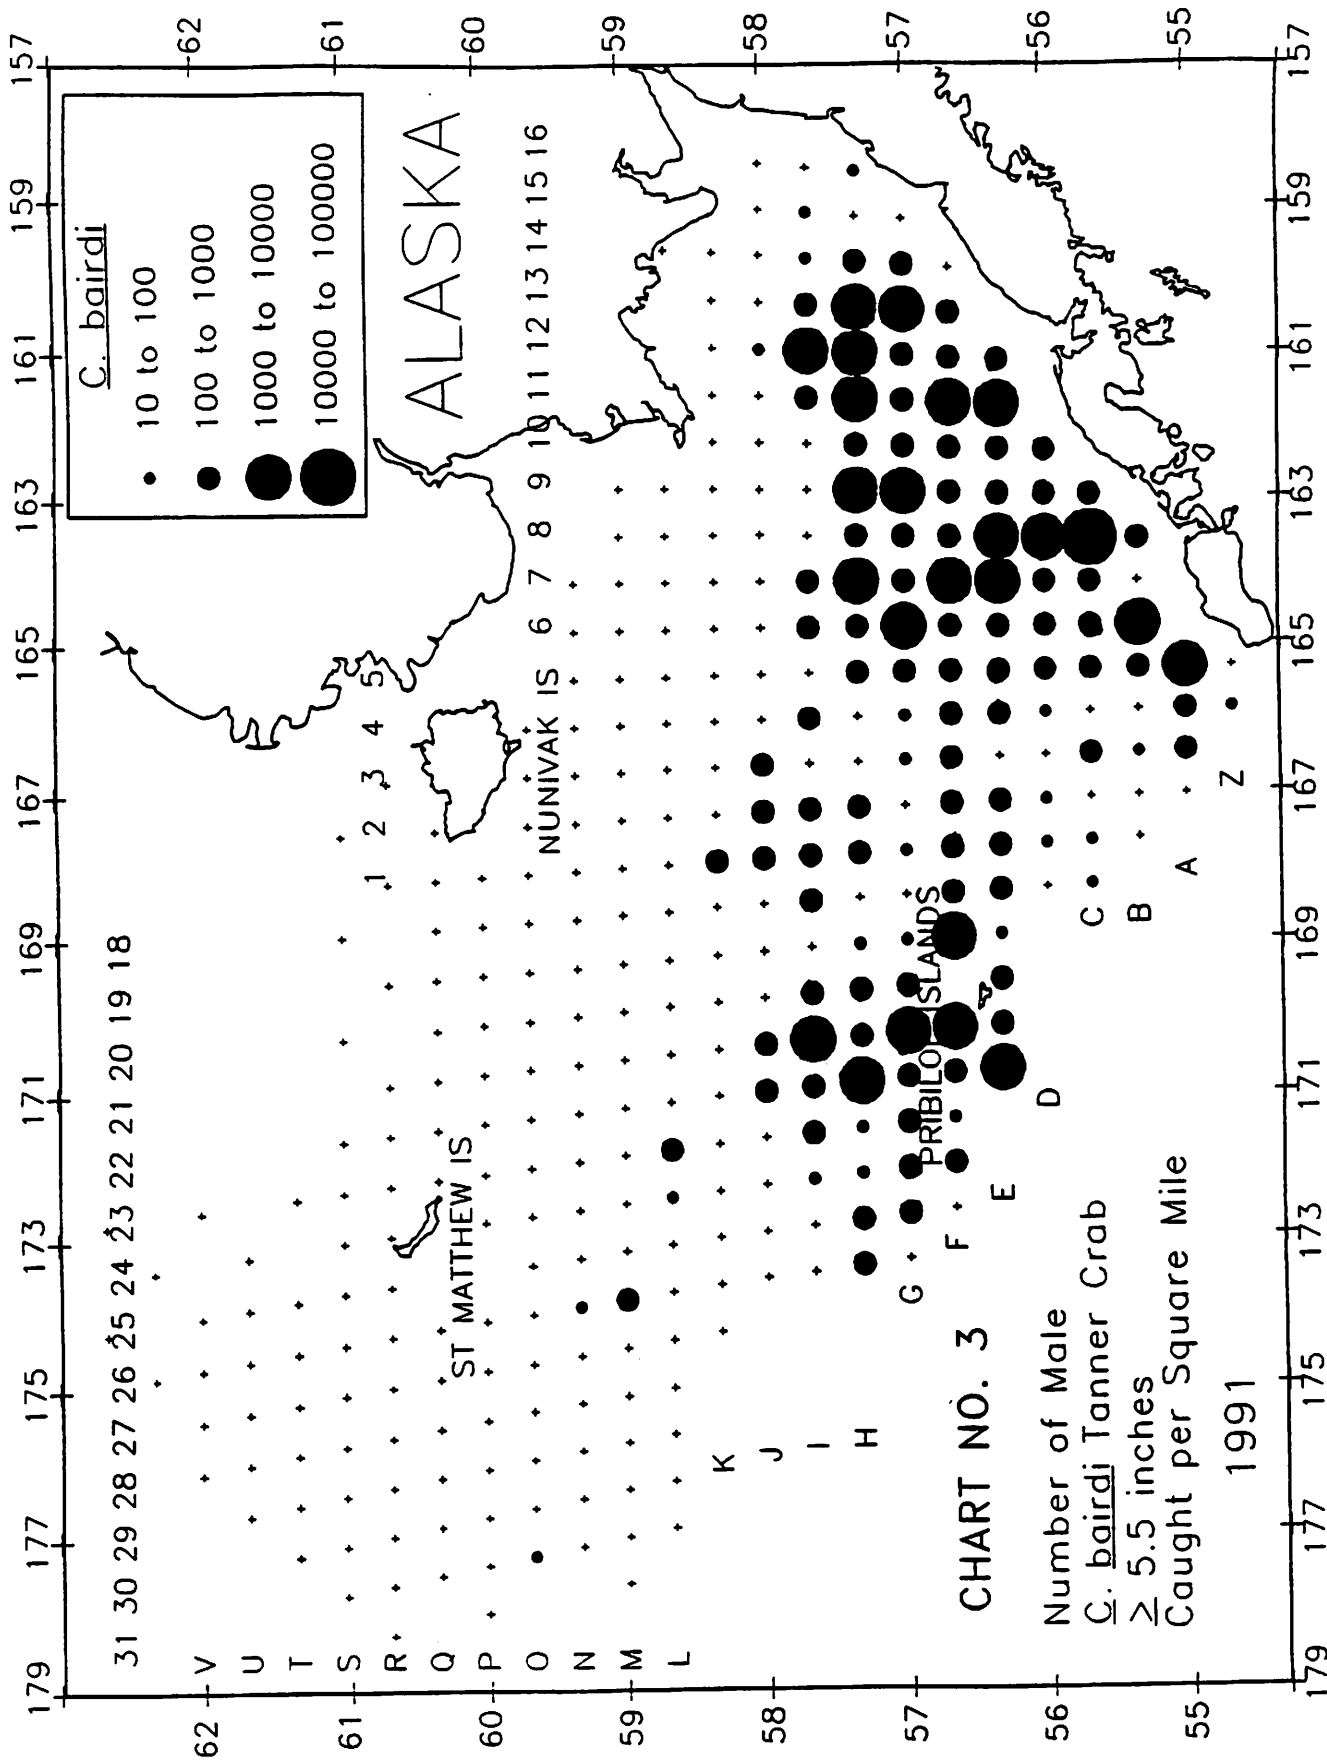

selected by computer. Of these randomly selected numbers, three will have an additional reward value of \$200.00 and three will have an additional reward value of \$300.00. In each case, the returned tag must be accompanied by all of the above listed information to be eligible. Cooperation is essential to the success of this program.

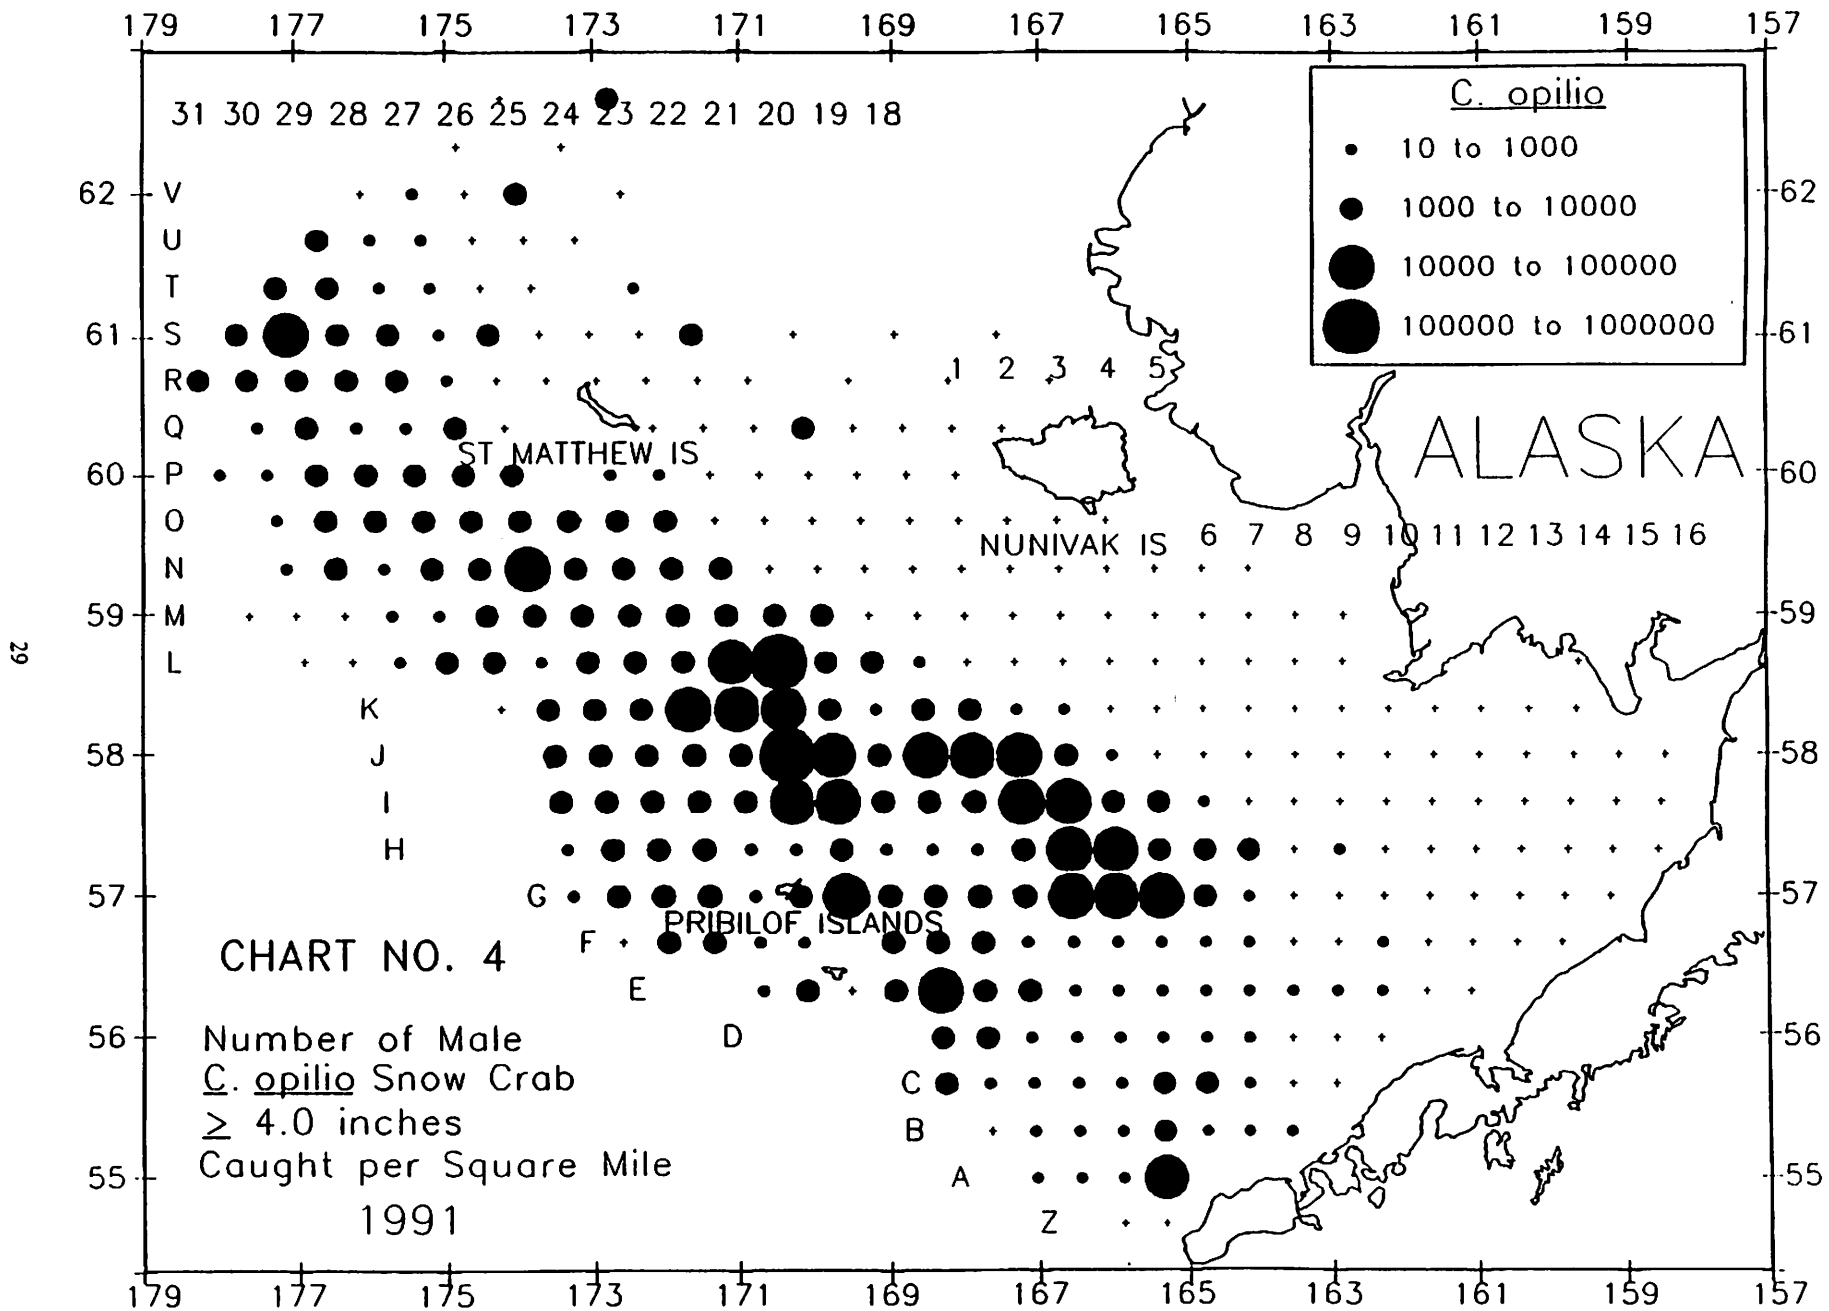

Acknowledgements

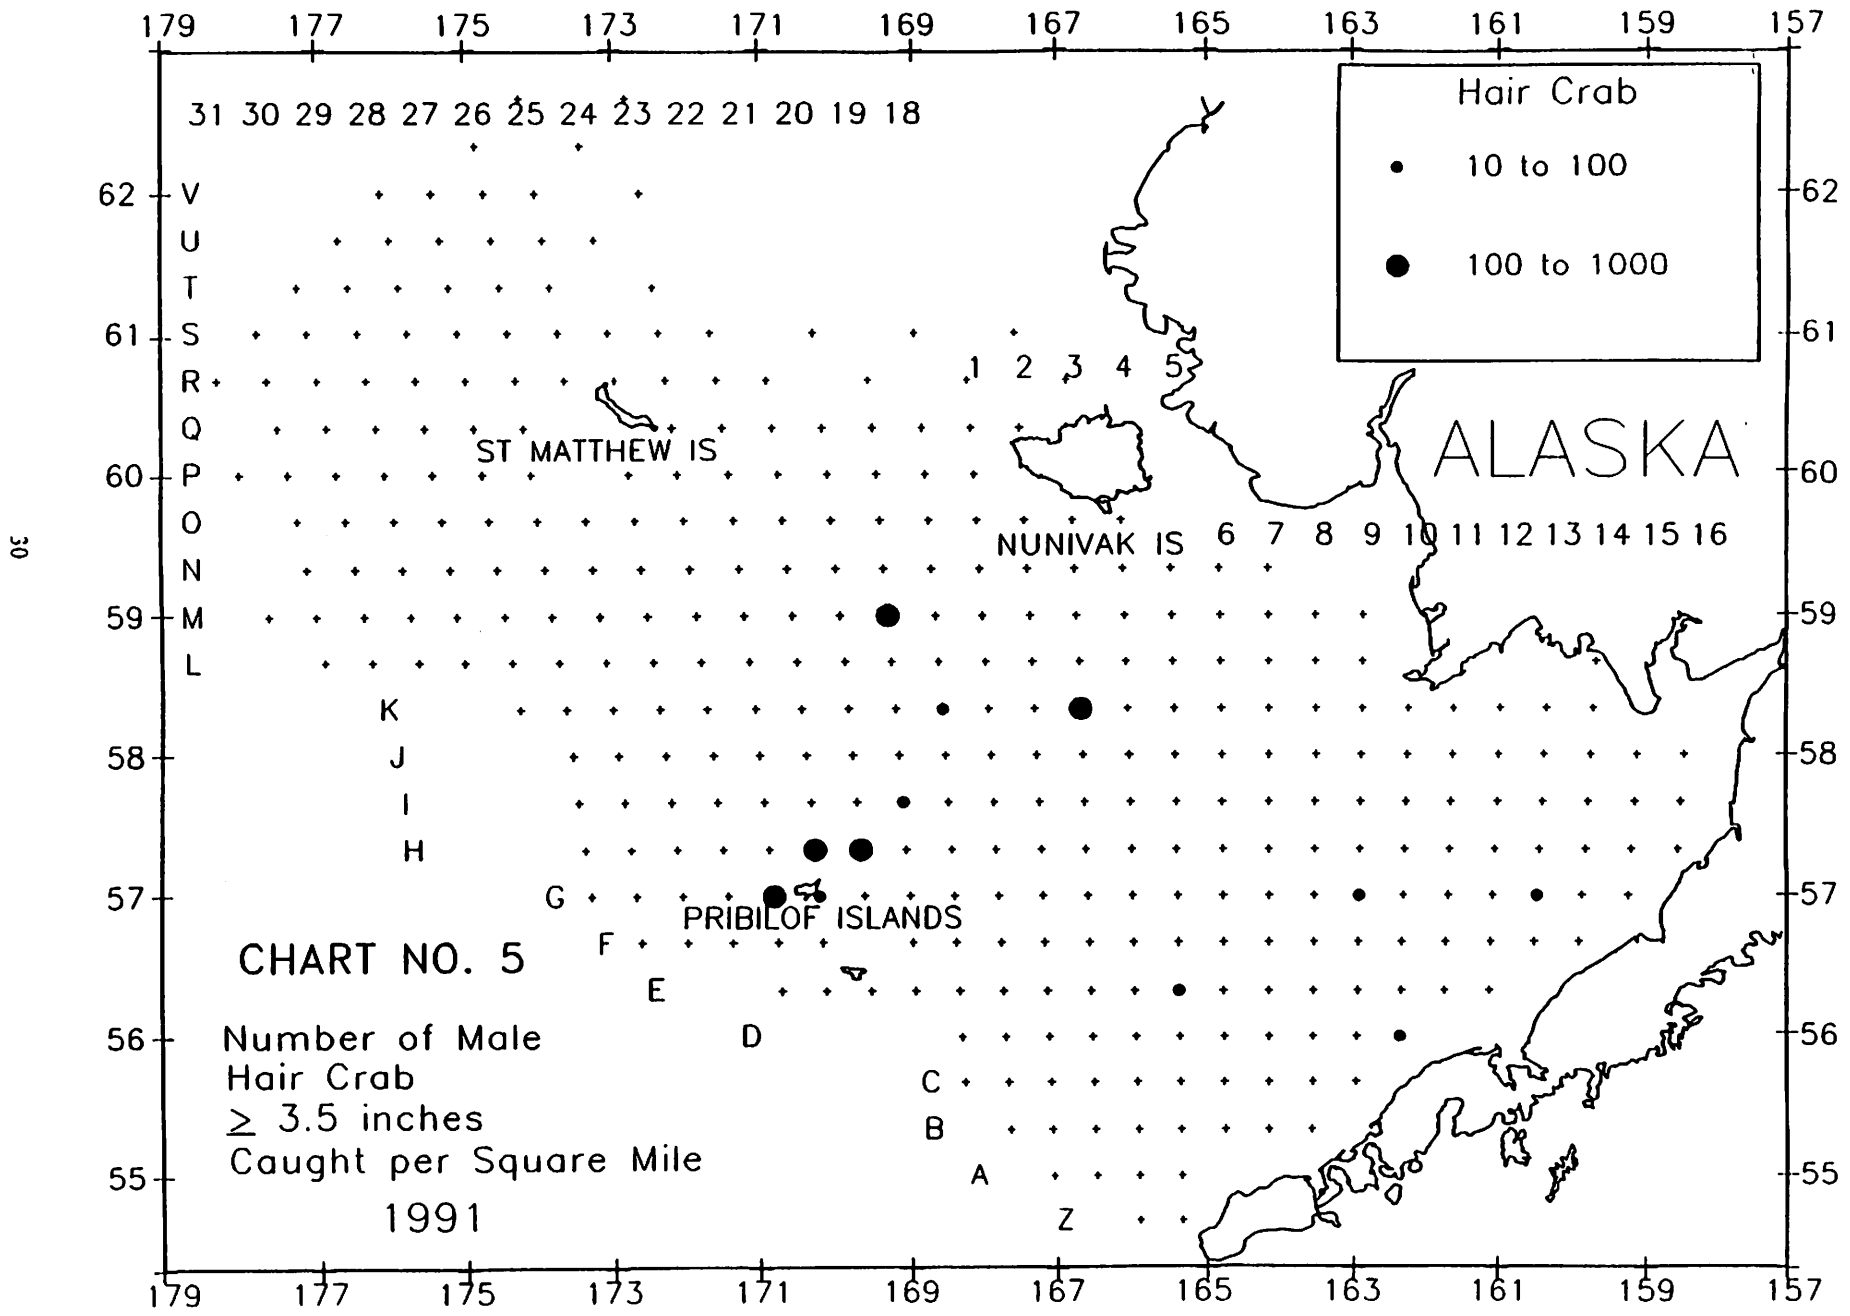

Successful completion of the annual eastern Bering Sea crab-groundfish survey is crucially dependent on the skipper and crews of the participating vessels. We extend special thanks to Mitch Hull and Joe Spicciati (FV Ocean Hope 3), Tom Oswald (RV Alaska), and their crews.
