Shark Stock Complex

BSAI Groundfish Plan Team Presentation November 2022

Cindy Tribuzio*, Mary Elizabeth Matta, Katy B Echave, Cara Rodgveller, Garrett Dunne and Keith Fuller

NOAA

OUTLINE

- Combined BSAI/GOA SAFE document
- Stock overview
- Relevant PT and SSC comments
- Models: Tier 5 Spiny Dogfish
- Models: Tier 6 Status Quo Models
- Models: Tier 6 Alternative Models
- Harvest Recommendations

COMBINED SHARK SAFE

- Combines redundant sections from both FMPs
- Provides separate FMP management advice
- Streamlined
- Reproducible!!!

19. Assessment of the Shark Stock Complex in the Bering Sea/Aleutian Islands and Gulf of Alaska

Cindy A. Tribuzio, Mary Elizabeth Matta, Katy B. Echave, Cara Rodgveller, Garrett Dunne and Keith Fuller

November 2022

EXECUTIVE SUMMARY

This document presents the assessments for the shark stock somplexes (Pacific spiny dogfish, Pacific sleeper shark, salmon shark and other/unidentified sharks) in the Gulf of Alaska (GOA) and Bering Sea/Aleutian Islands (BSAI) Fishery Management Plan (FMP) areas. Separate management advice is presented for each of the FMP shark stock somplexes and combining the two assessment documents does not change the management structure for the FMP shark stock complexes. The purpose of developing a combined shark stock complex assessment document is to ensure that review bodies have access to

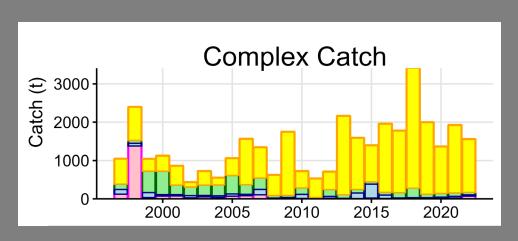

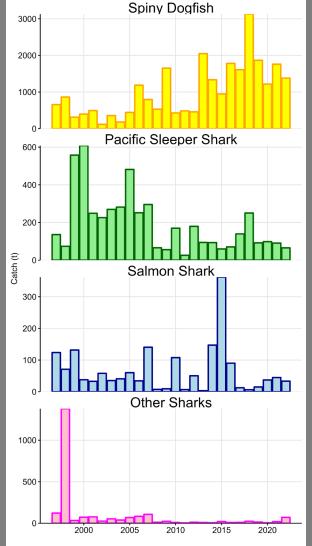

STOCK COMPLEX OVERVIEW

- Tier 5/6 Stock Complex
 - Spiny dogfish (Tier 5)
 - Pacific sleeper shark
 - Salmon shark
 - Other/unidentified sharks
- OFL = 5,006 t
- ABC = 3,755 t

- 2022 = 1,550 t (as of Oct 8, 2022)
- On average catch increases by ~33% after Oct 1

RELEVANT PT AND SSC COMMENTS

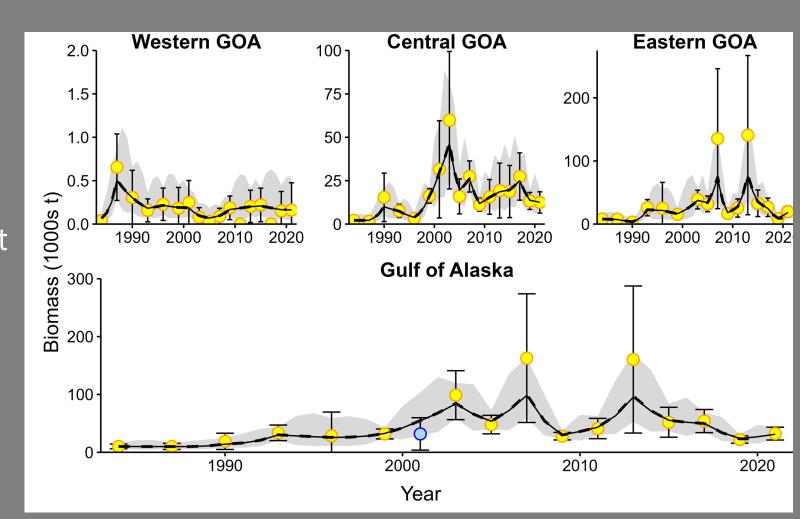

- "the SSC asks for additional examination and recommendations from the author and GPTs regarding the following [ORCS]:
 - SSC1: Whether the 75% ABC buffer is appropriate...... the evaluation[of] "fully exploited", and the assumption that all stocks that are fully exploited are at or above BMSY.
 - **SSC2:** the ORCS table of attributesdo not include any consideration of maturity of individuals caught[and how that relates to status].
 - SSC3: Is it appropriate to include the "Discard rate" category for a species that is not retained?
 - SSC4: Should uncertainty be evaluated only within the ORCS model (percentile scalar is chosen to satisfy risk tolerance and is set based on confidence that the exploitation status is correctly identified) or also outside the model in the risk table, noting that the ORCS scoring criteria also address aspects of risk." (SSC October 2022)

MODELS – TIER 5 SPINY DOGFISH

Model 15.3A

- RFX Biomass = 31,243 t
- q = 0.21
- Corrected biomass = 148,776 t
- $F_{OFL} = 0.04, F_{ABC} = 0.03$
- OFL = 5,591 t
- ABC = 4,463 t

Discussion of Tier 5 Spiny Dogfish

Up next: Pacific Sleeper Shark alternative models

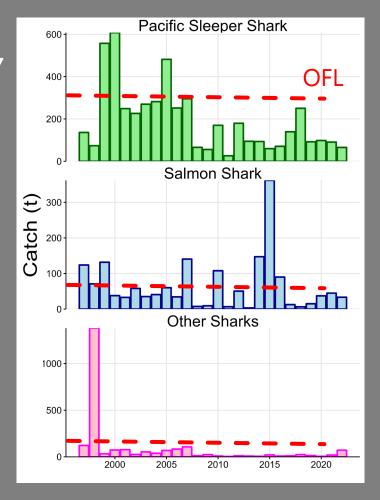

- Future plans
 - Use remain
 - Add in one or both longline surveys
 - Development of length based model

MODELS – TIER 6

Status Quo

- OFL = mean catch 1997 2007
- \blacksquare ABC = 0.75 * OFL
 - Pacific Sleeper Shark (PSS)
 - OFL = 312 t, ABC = 234 t
 - Salmon Shark (SS)
 - OFL = 70 t, ABC = 53 t
 - Other/unidentified Sharks (OS)
 - OFL = 188 t, ABC = 141 t

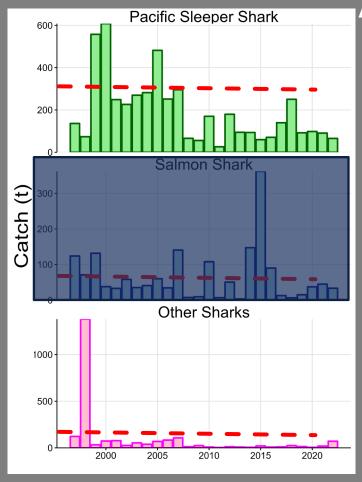

MODELS – TIER 6

Status Quo

- OFL = mean catch 1997 2007
- ABC = 0.75 * OFL
 - Pacific Sleeper Shark (PSS)
 - OFL = 312 t, ABC = 234 t
 - Salmon Shark (SS)
 - OFL = 70 t, ABC = 53 t
 - Other/unidentified Sharks (OS)
 - OFL = 188 t, ABC = 141 t

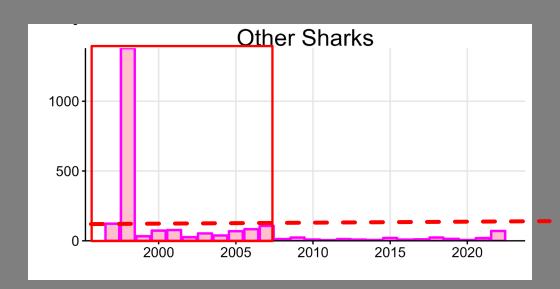

Alternative Models

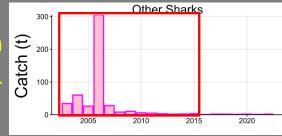

- Other/unidentified Sharks
 - Consistency with BSAI
 - Likely erroneous values
- Pacific Sleeper Shark
 - Incorporate qualitative information
 - Reduced risk of overfishing

MODELS – TIER 6 OTHER/UNIDENTIFIED

BSAI for comparison

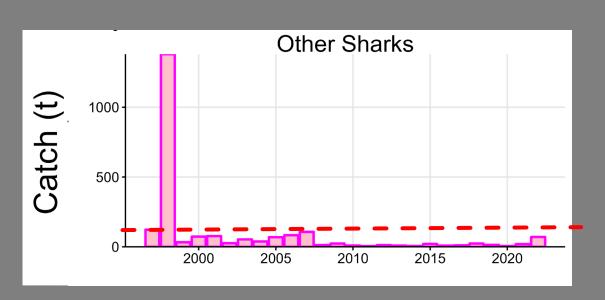

90th Percentile

- OFL = 90th percentile of catch 1997 –2007
- ABC = 0.75 * OFL
- Accounts for likely unreasonable extrapolations
- OS OFL = 123 t, ABC = 92 t

MODELS – TIER 6 OTHER/UNIDENTIFIED

Why 90th Percentile?

Year	Catch	Percentile
1997	123	0.9
1998	1380	1
1999	33	0.1
2000	73	0.5
2001	77	0.6
2002	26	0
2003	53	0.3
2004	39	0.2
2005	69	0.4
2006	83	0.7
2007	107	0.8

Discussion of Tier 6 OS Alternative Model

Up next: Pacific Sleeper Shark alternative models

Only Reliable Catch Series (ORCS)

- Expert judgment used to qualitatively score attributes (Table 19.7)
- Flexible to additional attributes
- Robust to assumptions of stock status
- Allows for incorporation of uncertainty of input information

NOAA Technical Memorandum NMFS-SEFSC-616

CALCULATING ACCEPTABLE BIOLOGICAL CATCH FOR STOCKS THAT HAVE RELIABLE CATCH DATA ONLY

(Only Reliable Catch Stocks – ORCS)

Full length article

The refined ORCS approach: A catch-based method for estimating stock status and catch limits for data-poor fish stocks

Christopher M. Free a,*, Olaf P. Jensen a, John Wiedenmann b, Jonathan J. Deroba c

- a Department of Marine and Coastal Sciences, Rutgers University, New Brunswick, NJ, USA
- ^b Department of Ecology, Evolution, and Natural Resources, Rutgers University, New Brunswick, NJ, USA

c NOAA Fisheries, Northeast Fisheries Science Center, Woods Hole, MA, USA

	Attribute	Score	Justification
1	Status of assessed stocks in fishery	1	0% of fishery stocks are overfished
2	Behavior affecting capture	2	Species does not exhibit significant aggregating behaviors
3	Discard rate	3	Discard rates are 99%
4	Targeting intensity	1	All sharks are non-targeted
5	M compared to dominant species	3	M is likely 20% lower than dominant species
6	Occurrence in catch	1	Occurs in <2% of observed hauls

Table 19.9 and described in detail in model results section

	Attribute	Score	Justification
1	Status of assessed stocks in fishery	1	0% of fishery stocks are overfished
2	Behavior affecting capture	2	Species does not exhibit significant aggregating behaviors
3	Discard rate	3	Discard rates are 88%
4	Targeting intensity	1	All sharks are non-targeted
5	M compared to dominant species	3	M is >20% lower than dominant species
6	Occurrence in catch	1	Occurs in <2% of observed hauls

- Table 19.9 and described in detail in model results section
- SSC3 ORCS is designed to encompass both discarded and retained stocks, Free et al. (2017) included both in analyses

	Attribute	Score	Justification
7	Value	1	Little to no market value
8	Recent trend in catch	2	No significant trends
9	Habitat loss	1	Species does not occupy identified threatened habitats
10	Recent trend in effort	2	No significant trends
11	Recent trend in abundance index	2	No significant trend
12	Proportion of population protected	3	No specific protection measures
13	Life history considerations	3	Low productivity and large proportion of catch is immature

Table 19.9 and described in detail in model results section

	Attribute	Score	Justification
7	Value	1	Little to no market value
8	Recent trend in catch	2	No significant trends
9	Habitat loss	1	Species does not occupy identified threatened habitats
10	Recent trend in effort	2	No significant trends
11	Recent trend in abundance index	2	No recent trend in GOA IPHC survey
12	Proportion of population protected	3	No specific protection measures
13	Life history considerations	3	Low productivity and large proportion of catch is immature

- Table 19.9 and described in detail in model results section
- IPHC is best GOA indicator, short time series

	Attribute	Score	Justification
7	Value	1	Little to no market value
8	Recent trend in catch	2	No significant trends
9	Habitat loss	1	Species does not occupy identified threatened habitats
10	Recent trend in effort	2	No significant trends
11	Recent trend in abundance index	NA	No recent BSAI data
12	Proportion of population protected	3	No specific protection measures
13	Life history considerations	3	Low productivity and large proportion of catch is immature

- Table 19.9 and described in detail in model results section.
- IPHC is best GOA indicator, short time series
- SSC2: Added to incorporate maturity of catch and species productivity

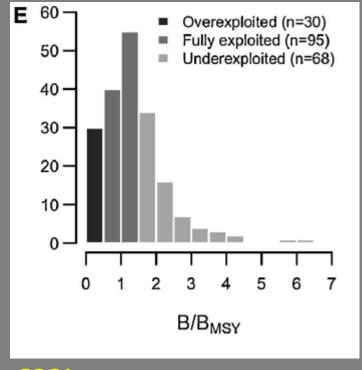

Mean attribute score determines

(Table 19.8, adapted from Free et al. 2017)

Mean Score	Stock status	Catch statistic	50th
<1.5	Underexploited	90th percentile, whole time series	1.90
1.5 – 2.5	Fully exploited	25th percentile, previous 10 years	2.16
> 2.5	Overexploited	10th percentile, whole time series	1.56

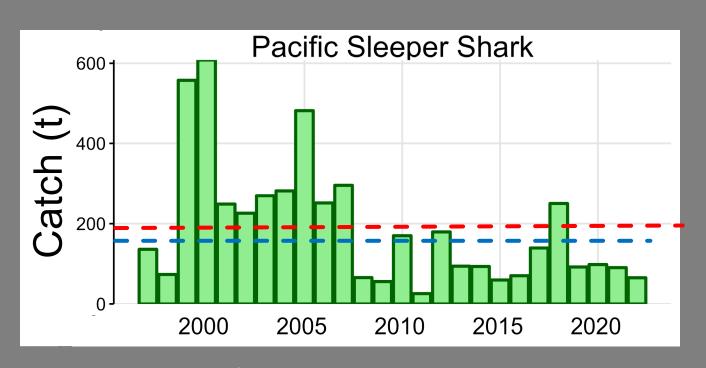

From Free et al. 2017

SSC₁

Mean Score	1.92	
Stock Status	Fully	
Stock Status	Exploited	
Catch Statistic	91 t	
Scalar	2.16	
OFL	197	
ABC	148	

For comparison, if classified as "overexploited" with 50th percentile scalar the ABC/OFL would be 73 t and 97 t

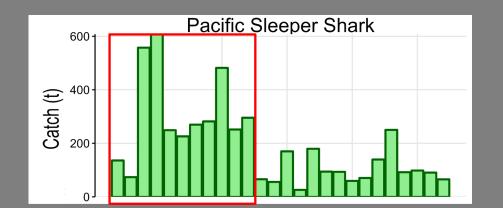

Discussion of PSS Alternative Model

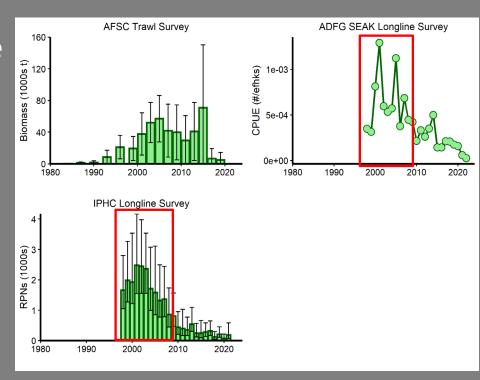

Up next: Recommendations

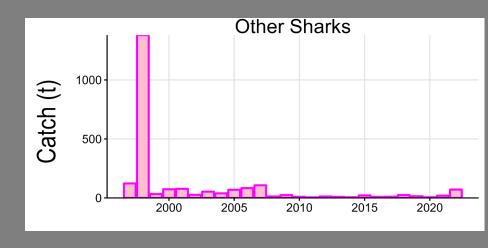

- PSS Status Quo Concerns:
 - Time series needs to be based on period of stable catch
 - Maximum or Mean catch scalars have high risk of overfishing
 - Does not allow for inclusion of other information

S

- PSS Status Quo Concerns:
 - Time series needs to be based on period of stable catch
 - Maximum or Mean catch scalars have high risk of overfishing
 - Does not allow for inclusion of other information
- Other/Unidentified Sharks Status Quo Concerns:
 - Rare occurrences can result in large catch extrapolations
 - Consistency with BSAI

- Alternative models:
 - Account for erroneous catch extrapolations due to extremely rare events
 - Expand information utilized for Pacific sleeper shark, so that the Best Scientific Information Available is being used
- PSS22.0 (ORCS) is a much improved base model, potential future developments
 - Weighting attributes
 - Expanding time series indices beyond recent 5 years for long lived species

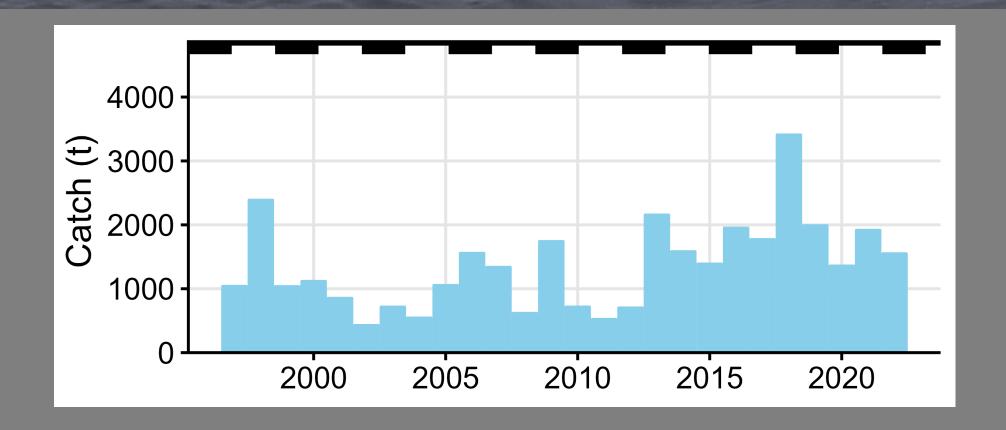

Status Quo

Species	Model	OFL (t)	ABC (t)
Pacific Sleeper	11.0	312	234
Salmon	11.0	70	53
Other/Unid	11.0	188	141
Spiny Dogfish	SD15.3A	5,951	4,463
Shark Stock		6,521	4,891
Complex		0,321	4,031

Alternative Models

Species	Model	OFL (t)	ABC (t)
Pacific Sleeper	PSS22.0	197	148
Salmon	SS11.0	70	53
Other/Unid	OU22.0	123	92
Spiny Dogfish	SD15.3A	5,951	4,463
Shark Stock		6,341	4,756
Complex		0,341	4,730

Risk Tables

Assessment-	Population dynamics	Enviro/	Fishery
related		ecosystem	Performance
Level 1: no increased concerns	Level 2: Substantially increased concerns	Level 1: no increased concerns	Level 1: no increased concerns

SSC4

- SSC: "risk" is the risk of the ABC exceeding the true (but unknown)
 OFL
- Different sources of information
- Selection of ORCS OFL scalar does not overlap with risk table
 - ORCS allows for informed OFL choices
 - Risk table adjusts ABC buffer

Risk Tables

Assessment-	Population dynamics	Enviro/	Fishery
related		ecosystem	Performance
Level 1: no increased concerns	Level 2: Substantially increased concerns	Level 1: no increased concerns	Level 1: no increased concerns

SSC1

- Is 75% buffer appropriate?
- The Tier 5/6 HCR does allow for reductions of the buffer
- Bigger question than just sharks

Risk Tables

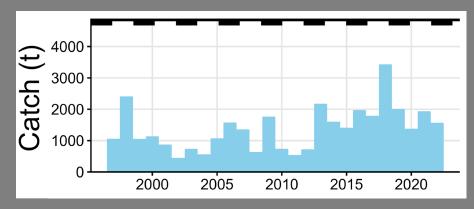

Assessment-	Population dynamics	Enviro/	Fishery
related		ecosystem	Performance
Level 1: no increased concerns	Level 2: Substantially increased concerns	Level 1: no increased concerns	Level 1: no increased concerns

ABC Reductions

- Available information do not suggest reductions from maximum ABC are necessary
- IF alternative models are selected
- Status Quo:
 - Population dynamics to Level 3 due to PSS considerations

	As estimated or specified last year for:		As estimated or recommended this year for:
