

2022 Tanner Crab Stock Assessment

William Stockhausen
AFSC/NMFS/NOAA

Sept 14, 2022

Notes on SAFE Chapter

Converted to RMarkdown from Word

- no more cut-and-paste figures and tables
- about 85% successful
- need to improve
 - table sizing/fonts
 - units labelling (“thousands t”)

Summarizes model comparisons

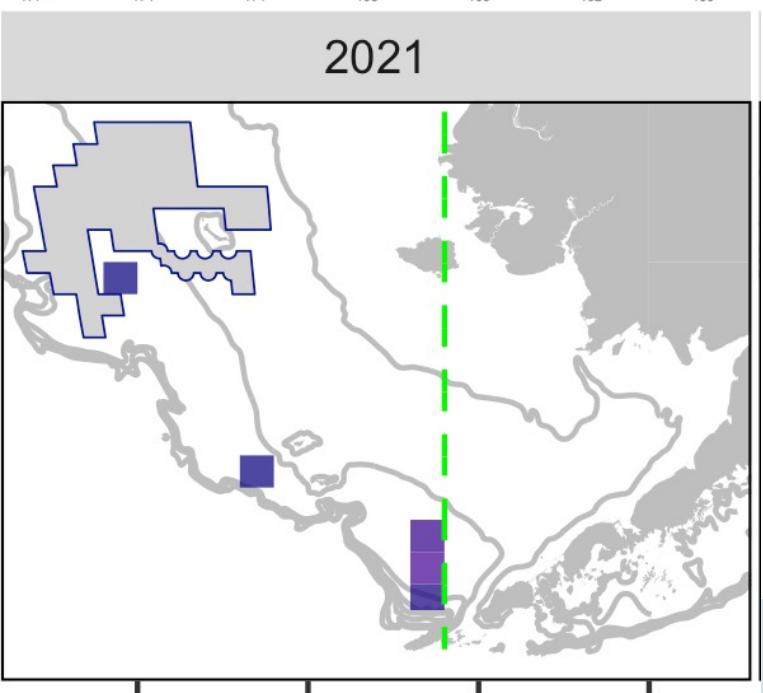

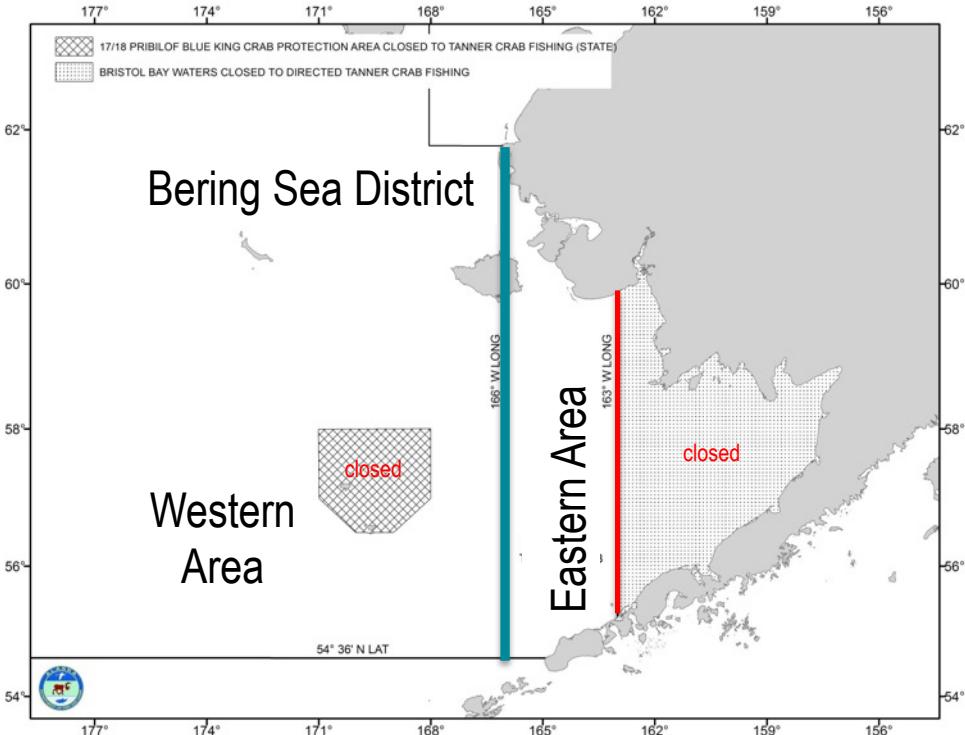

- focuses on base and preferred model

Comprehensive comparisons in Appendices

- D: Tables
- E: Figures
- G: Management Quantities

Overview:

- 2021/22 Federal management
 - OFL: 27,170 t
 - ABC: 21,740 t
 - Total catch mortality: 780 t (< OFL)
 - **overfishing did not occur**
 - mostly taken in directed fishery
 - 2021/22 MMB: 62,050 t (> MSST = 17,370 t)
 - **stock is not overfished**
- ADFG management
 - Eastern Area closed
 - MMB failed to meet threshold
 - Western Area
 - TAC: 499 t
 - Retained catch: 494 t
 - 19,252 potlifts
 - CPUE: 26 kg/pot (+25%)

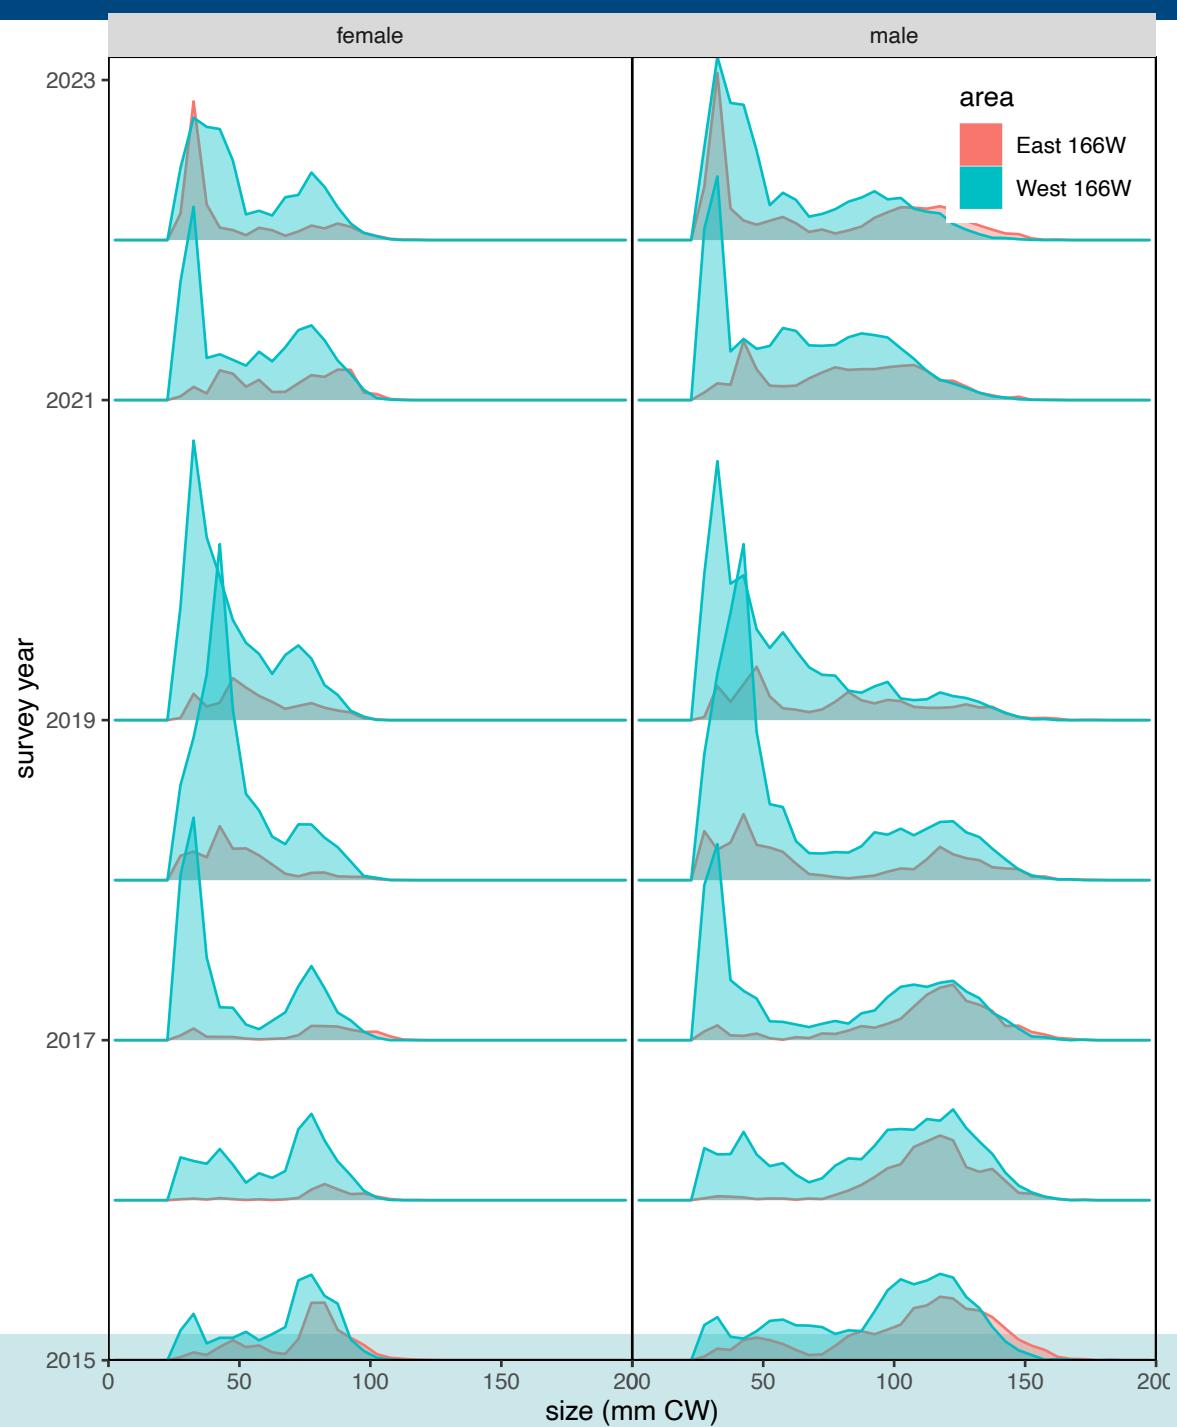

Overview:

Surveys

- 2022 NMFS EBS Shelf Survey Biomass
 - 29,254 t male biomass (+7%)
 - 6,252 t industry-preferred males (-3% [-21%W])
 - 9,232 t female biomass (+10%)
- Concern:
 - evidence for recent recruitment
 - not moving into larger size classes

2022/23 Management

- Based on preferred model (20.03)
 - Tier 3a ($B > B_{MSY}$; not overfished)
 - OFL: 32,810 t (+21%)
 - ABC: 24,610 t (25% buffer)

Outline

- SSC & CPT Comments
- Recent Fishery & Survey Trends
- Model Description & Scenarios
- Model Evaluation
- Status Determination & OFL Calculation
- Final Remarks

2021: Moving forward

- Looking for prioritization on:
 - implement projection capabilities in TCSAM02 ✓
 - implement delta approximation in TCSAM02 ✓
 - transition to GMACS
- finish BSFRF/NMFS SBS survey selectivity analysis
 - would be helpful to have 2018 BSFRF survey data
- continue exploring ways to simplify model structure
 - start model in 1982 ✓
 - drop fits to small-catch bycatch data
- investigate nonparametric approaches to selectivity
- develop model that better reflects State management structure ✓

SSC & CPT Comments

CPT Comment: Four models are requested by the CPT for the September CPT meeting: 1) Model 22.01: Base model from last year updated with new data; 2) Model 22.03: updated bycatch estimates for the groundfish fisheries, and fitting to fishery aggregate biomass; 3) modified model 22.06a: Initial size composition in 1982 with a smoothing weight of 0.1, and initial composition parameters estimated on a logit scale, but also including the features of model 22.03; and 4) modified model 22.06a as described above plus bootstrap estimates of input sample sizes.

Response (9/22): All requested models were implemented and results are provided in this assessment. The latter two models were numbered as 22.07 and 22.08 because they differ from models presented in May.

SSC Comment: the SSC commends the authors for proposing two models (22.01 and 22.03) with no parameters hitting bounds and the remaining models having only two or three parameters at bounds (depending on smoothing). The SSC recommends continued efforts to examine and address the remaining parameters that are still estimated at their bounds.

Response (9/22): The author appreciates the SSC comment and notes that remaining parameters at bounds involve limits on selectivity-related parameters reflecting knife-edge like selectivity patterns (e.g., retention functions) or full selected sizes that would go beyond observed sizes in the data. Implementation of a well-behaved bounding function is an area of active (although incomplete) research.

SSC & CPT Comments

SSC Comment: Even though the estimation of input sample sizes did not perform as expected (it produced even higher sample sizes than default values in the base model), the SSC supports the CPT recommendation to revisit this approach with the revised start date (1982).

Response: Model 22.08 addresses this request, but results remained problematic. The author notes that multinomial likelihoods were used in fitting this model and that it should be reconsidered using the Dirichlet-multinomial likelihood.

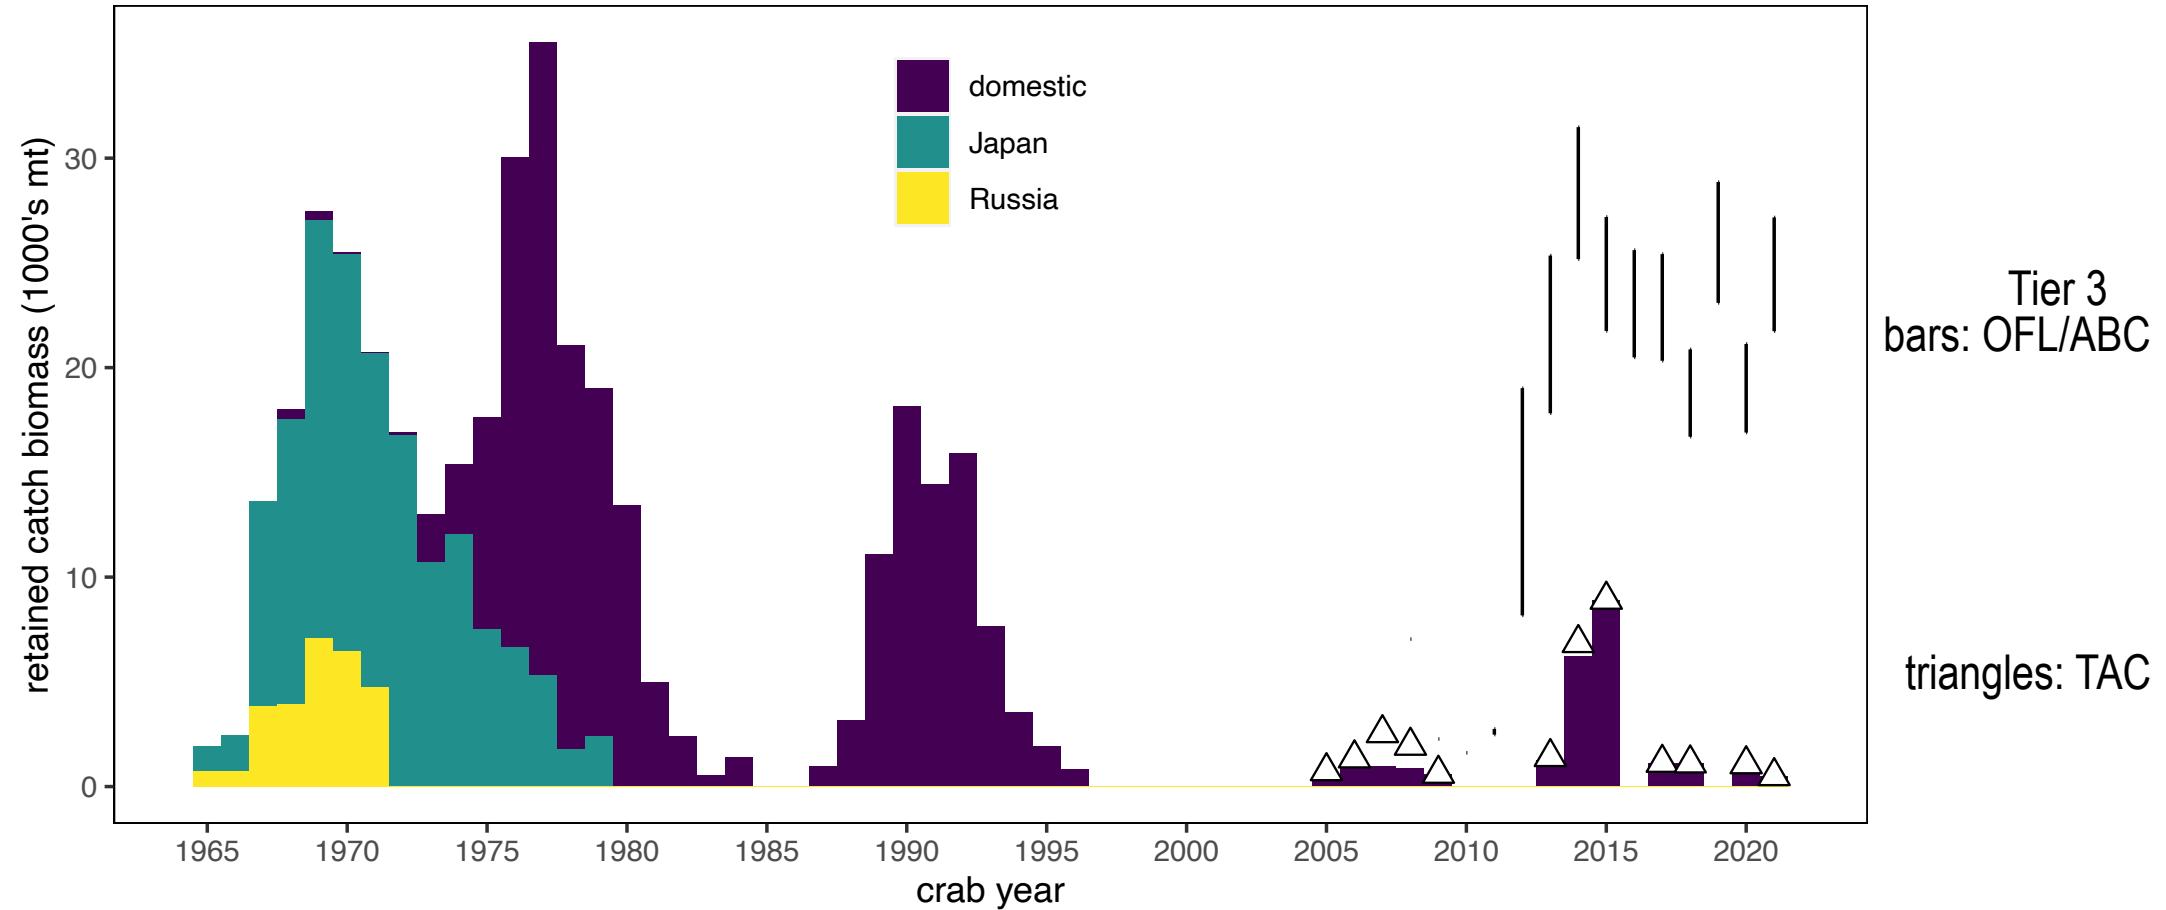

SSC Comment: The SSC reiterates its suggestion from October 2020 to prioritize development of a projection model for crab that doesn't assume the entire OFL is removed, which is especially important for the EBS Tanner crab stock where exploitation is routinely below the OFL.

Response (9/22): A projection model of the type described has been implemented. 20-year projections at 0, 0.25, 0.5, 0.75, 1, and 1.25 times F_{OFL} for the directed fishery have been included in the assessment for the base and author-preferred models.

Assessment: Tier 3 size-structured model

Fits to

- Survey data
 - biomass, size comps
 - NMFS EBS shelf survey
 - 1975-present (no 2020)
 - male maturity ogives (2006+)
 - BSFRF side-by-side haul studies
 - 2013-2017 (2018 not obtained)
- Molt increment data
- Fishery data (biomass, size comps)
 - directed fishery (areas combined)
 - retained catch (1965+)
 - total catch (1991+)
 - bycatch in
 - snow crab fishery (1990+)
 - BBRKC fishery (1990+)
 - groundfish fisheries (1973+)

Model estimates

- Natural mortality (M)
- growth (molt increment)
- probability of molt to maturity
- initial abundance
- recruitment
- fully-selected capture rates
- size-specific fishery selectivity
- size-specific retention
- NMFS survey catchability
- NMFS survey selectivity

Fixed parameters

- weight-at-size
- handling mortality rates
- availability to BSFRF survey
- fully-selected sizes

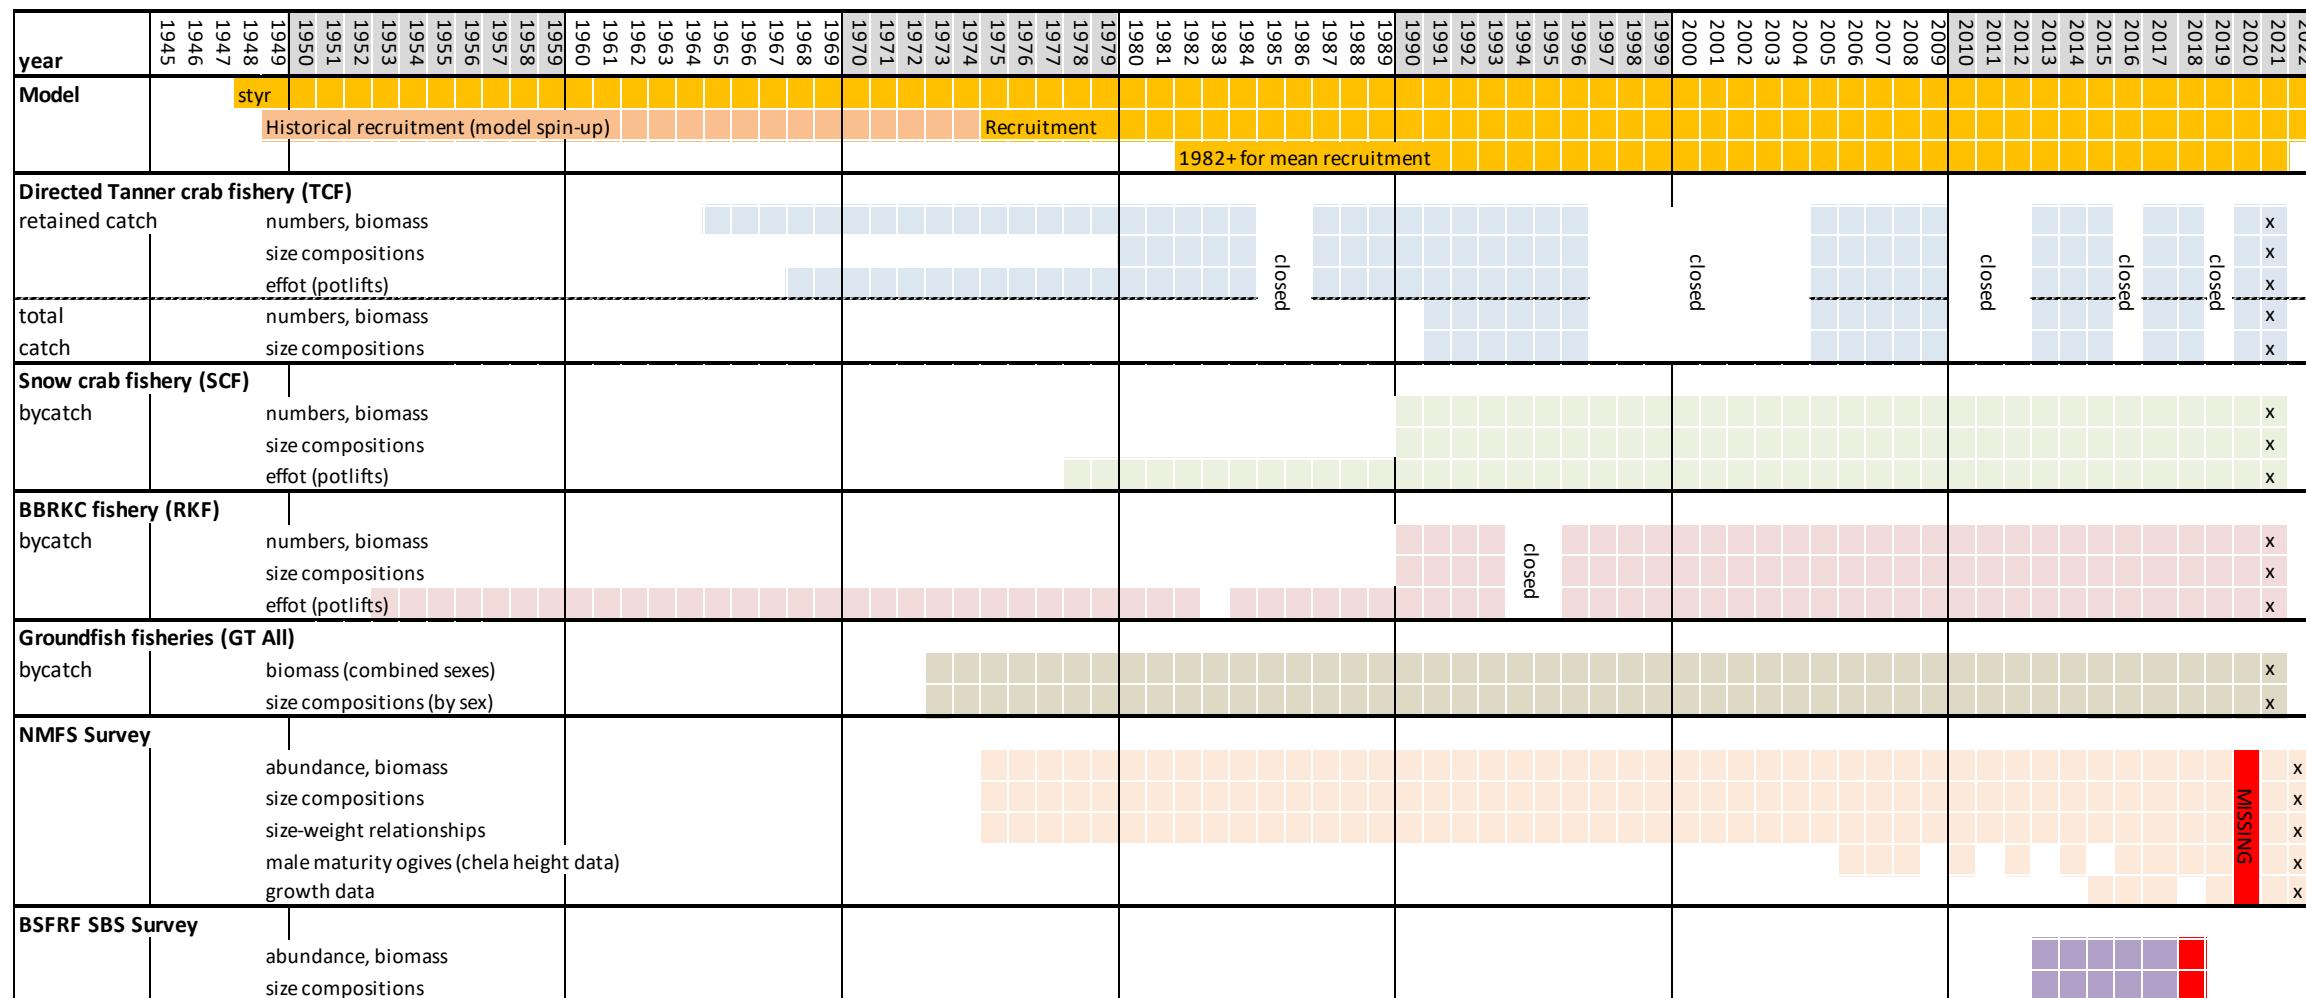

Determines

- Avg. Rec., F_{msy} , B_{msy} ,
- F_{OFL} , OFL, ABC

NOAA FISHERIES

Model time frames and data

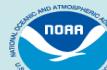

Fisheries: Directed Fishery

Fishery/process	time blocks	22.01 description
TCF	directed Tanner crab fishery	
capture rates	pre-1965	male nominal rate
	1965+	male ln-scale mean + annual devs
	1949+	ln-scale female offset
male selectivity	1949-1990	ascending logistic
	1991-1996	annually-varying ascending logistic
	2005+	annually-varying ascending logistic
female selectivity	1949+	ascending logistic
male retention	1949-1990; 1991-	ascending logistic
	1996; 2005-2009;	
	2013+	
max % retained	pre-1988	fixed at 100%
	1991-1996	fixed at 100%
	2005-2009	fixed at 100%
	2013+	fixed at 100%

Model Evaluation

- 22.08: higher input (bootstrapped) sample sizes put too much weight on NMFS survey size comps
 - smaller survey Q's->increased scale->increased recruitment, MMB trajectories
- 22.09, 22.10, 22.11: 2022-specific retention curve estimated
 - ad hoc adjustment not reviewed by CPT
 - little impact on results
 - "not ready for prime time"
- 22.07: model starts in 1982
 - ~50 more parameters than base model
 - SSC identified standardizing criteria for changing model start time as issue for CPT
 - "not ready for prime time"
- 22.01: last year's assessment model with updated groundfish fisheries bycatch estimation
 - balances **proportional** errors in fitting male and female catch biomass time series
 - inflates **arithmetic** errors
- 22.03: fits total catch (males+females) catch biomass time series
 - balances arithmetic errors
 - otherwise very similar to 22.01

Outline

- SSC & CPT Comments
- Recent Fishery & Survey Trends
- Model Description & Scenarios
- Model Evaluation
- Status Determination & OFL Calculation
- Final Remarks

OFL Calculation: Average Recruitment Timeframe (22.03)

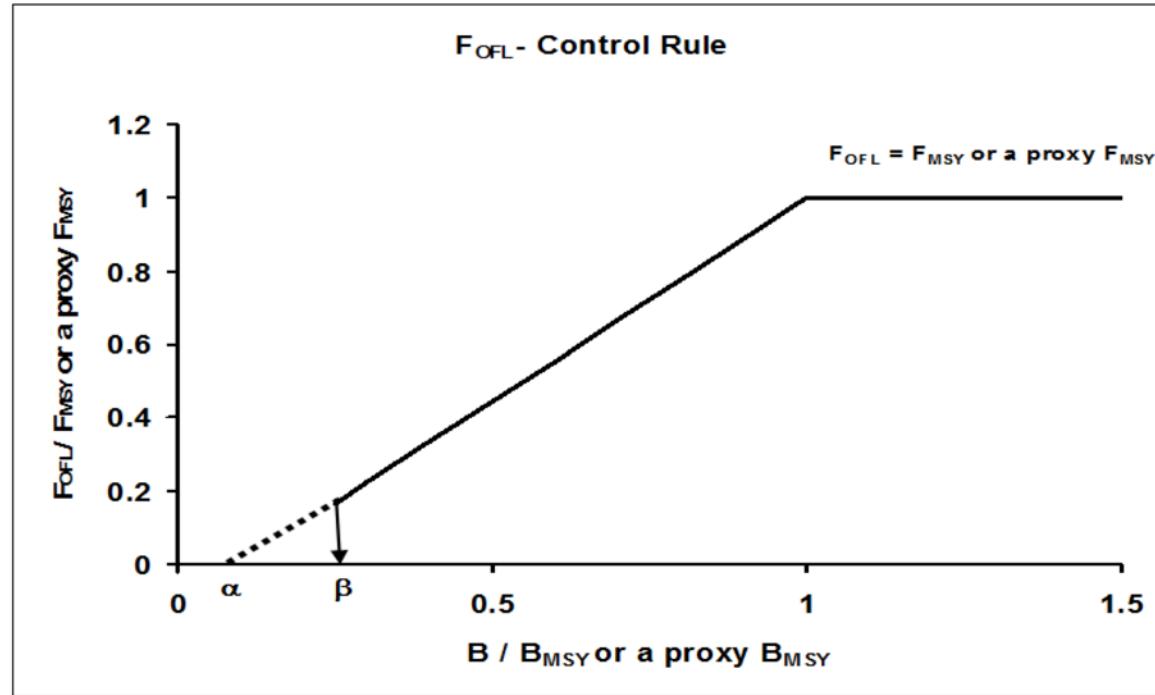

- 1982-2021 (terminal year-1; same as last year)
- 2019 recruitment very low, but fairly consistent with 2021 survey size compositions
- higher recruitment in 2021 supported by survey results

- Avg Rec. = 396 million

OFL Calculation: 22.03

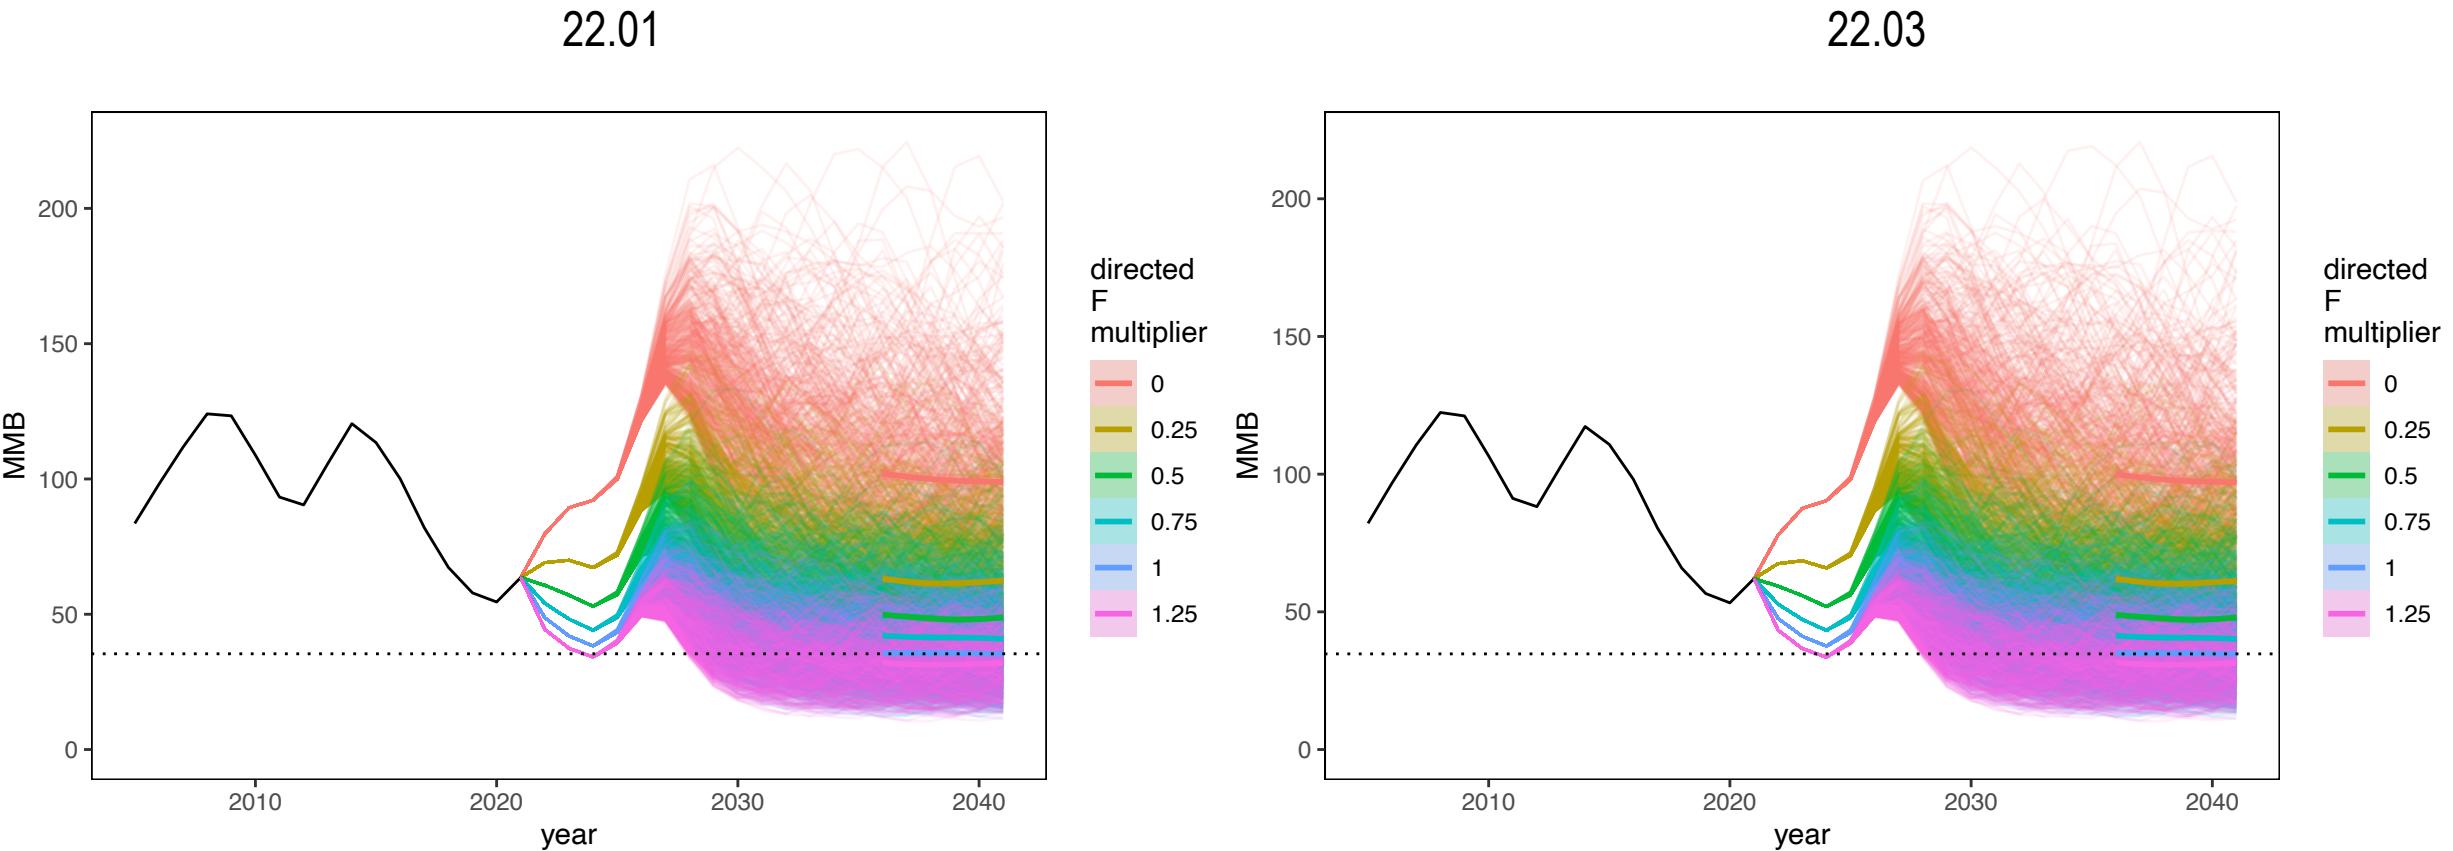

MLE Results (22.03)

- MMB_{2021/22} = 62.05 kt
- Avg Rec. = 396 million
- B_{MSY} = 34.73 kt
- F_{MSY} = 1.17 yr⁻¹
- F_{OFL} = 1.17 yr⁻¹
- OFL = 32.80 kt
- MMB_{2022/23} = 47.58 kt
- Tier 3a

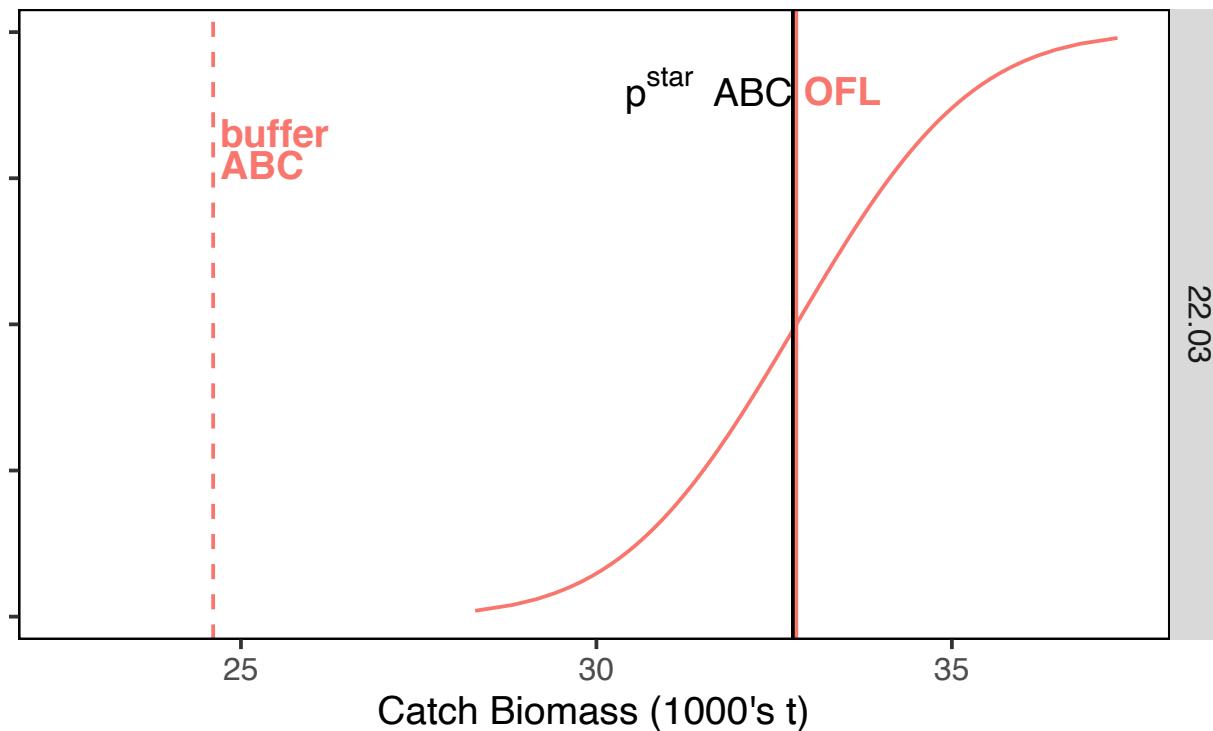

NOAA FISHERIES

Projections

ABC Determination (22.03)

MLE Results

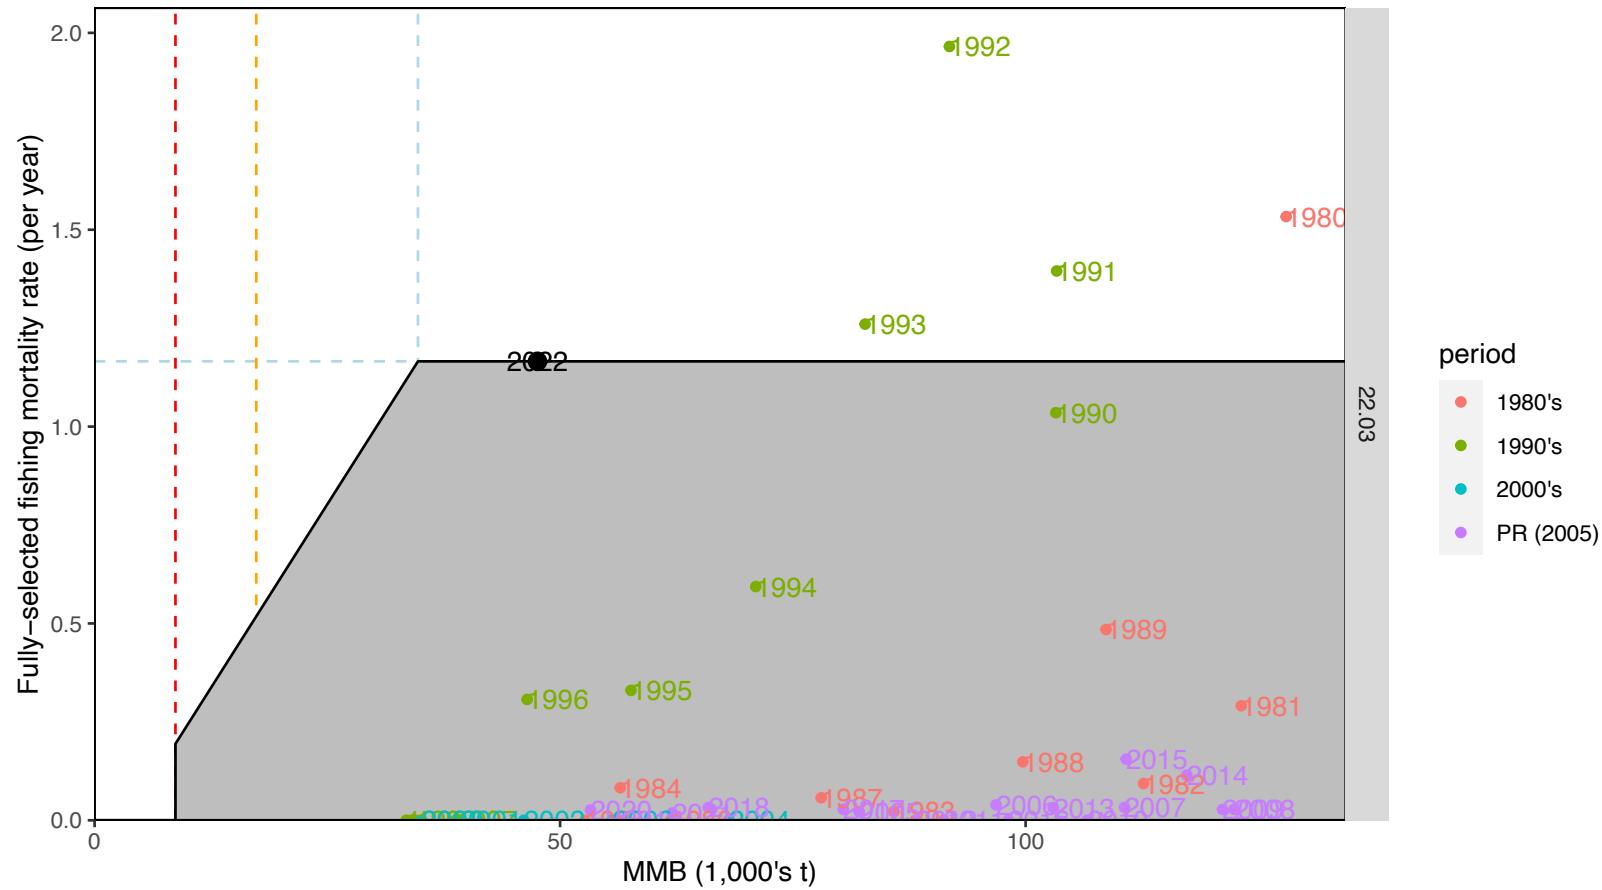

- OFL = 32.81 kt
- p^{\star} ABC = 32.76 kt

Buffer recommendation: 25%

- increase from last year (+5%)
- missing 2020 survey continues to affect results
- smaller survey q estimates
- overestimating large crab
- overestimating terminal year survey biomass
- disappearing recruitment

buffer ABC = 24.61 kt (25%)

Stock Status (22.03)

NOAA FISHERIES

Stock Status (22.03)

- Tier 3a
- Not overfished
- No overfishing

Year	Tier	Bmsy	Projected MMB	B/Bmsy	Fofl	Years to Define Bmsy
2017/18	3a	29.17	47.04	1.49	0.75	1982-2017
2018/19	3a	21.87	23.53	1.08	0.93	1982-2018
2019/20	3b	41.07	39.55	0.96	1.08	1982-2019
2020/21	3b	36.62	35.31	0.96	0.93	1982-2019
2021/22	3a	35.94	42.57	1.18	1.17	1982-2020
2022/23	3a	34.73	47.58	1.37	1.17	1982-2021

M: immature: 0.24, females: 0.31, males: 0.31 (Table 52, p. 132)

Outline

- SSC & CPT Comments
- Recent Fishery & Survey Trends
- Model Description & Scenarios
- Model Evaluation
- Status Determination & OFL Calculation
- Final Remarks

2022: Moving forward

- transition to GMACS
- finish BSFRF/NMFS SBS survey selectivity analysis
 - would be helpful to have 2018 BSFRF survey data
- explore temporally-varying natural mortality
- investigate nonparametric approaches to selectivity
- revisit
 - model that better reflects State management structure
 - model that starts in 1982 (drops uncertain historical data)

NOAA FISHERIES

Survey Spatial Distributions

larger males (> 60 mm CW)

mature females

Model Processes

process	time blocks	22.01 description
Population rates and quantities		
Population built from annual recruitment		
Recruitment	1949-1974	In-scale mean + annual devs constrained as AR1 process
	1975+	In-scale mean + annual devs
	1949+	sigma-R fixed, sex ratio fixed at 1:1
Growth	1949+	sex-specific mean post-molt size: power function of pre-molt size
		post-molt size: gamma distribution conditioned on pre-molt size
Maturity	1949+	sex-specific size-specific probability of terminal molt
		logit-scale parameterization
Natural mortality	1949-1979,	estimated sex/maturity state-specific multipliers on base rate
	1985+	priors on multipliers based on uncertainty in max age
	1980-1984	estimated "enhanced mortality" period multipliers

Fisheries: Snow Crab Fishery

Fishery/process	time blocks	22.01 description
SCF	bycatch in snow crab fishery	
capture rates	pre-1978	nominal rate on males
	1979-1991	extrapolated from effort
	1992+	male ln-scale mean + annual devs
	1949+	ln-scale female offset
male selectivity	1949-1996	dome-shaped (double normal) --plateau width fixed to 0 --descending limb width fixed to 1
	1997-2004	dome-shaped (double normal)
	2005+	dome-shaped (double normal)
female selectivity	1949-1996	ascending logistic
	1997-2004	ascending logistic
	2005+	ascending logistic

Fisheries: Other

Fishery/process	time blocks	22.01 description
RKF	bycatch in BBRKC fishery	
capture rates	pre-1952	nominal rate on males
	1953-1991	extrapolated from effort
	1992+	male ln-scale mean + annual devs
	1949+	ln-scale female offset
male selectivity	1949-1996	ascending normal, asymptote fixed
	1997-2004	ascending normal, asymptote fixed
	2005+	ascending normal, asymptote fixed
female selectivity	1949-1996	ascending normal, asymptote fixed
	1997-2004	ascending normal
	2005+	ascending normal
GTF	bycatch in groundfish fisheries	
capture rates	pre-1973	male ln-scale mean from 1973+
	1973+	male ln-scale mean + annual devs
	1973+	ln-scale female offset
male selectivity	1949-1986	ascending logistic
	1987-1996	ascending logistic
	1997+	ascending logistic
female selectivity	1949-1986	ascending logistic
	1987-1996	ascending logistic
	1997+	ascending logistic

NOAA FISHERIES

Surveys

Survey/process	time blocks	22.01 description
NMFS EBS trawl survey		
male survey q	1975-1981	In-scale
	1982+	In-scale w/ prior based on Somerton's underbag experiment
female survey q	1975-1981	In-scale
	1982+	In-scale w/ prior based on Somerton's underbag experiment
male selectivity	1975-1981	ascending normal, fixed fully-selected size at 180
	1982+	ascending normal, fixed fully-selected size at 180
female selectivity	1975-1981	ascending normal, fixed fully-selected size at 130
	1982+	ascending normal, fixed fully-selected size at 130
BSFRF SBS trawl surveys		
male catchability	2016-2017	fixed at 1 for all sizes
male availability	2016-2017	empirically-determined outside the model
female catchability	2016-2017	fixed at 1 for all sizes
female availability	2016-2017	empirically-determined outside the model

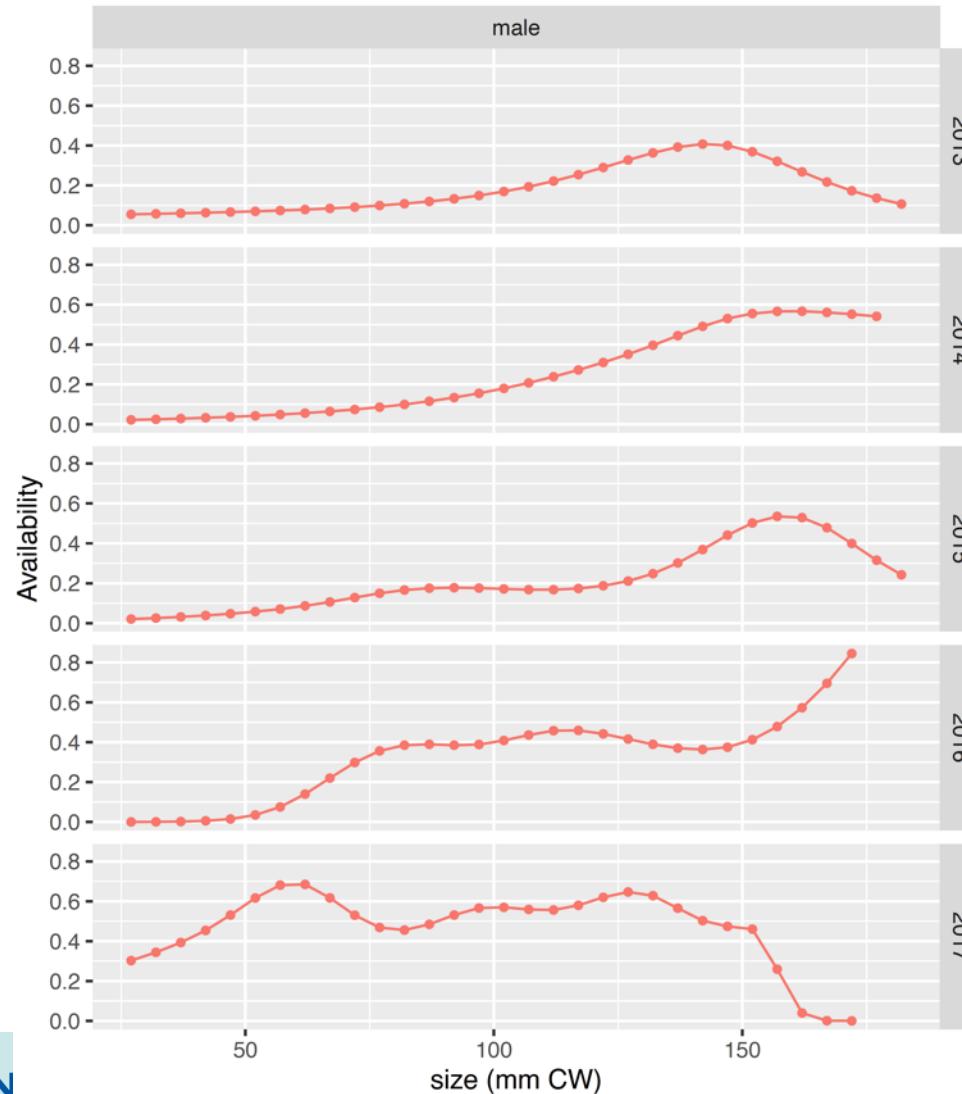

NOAA FISHERIES

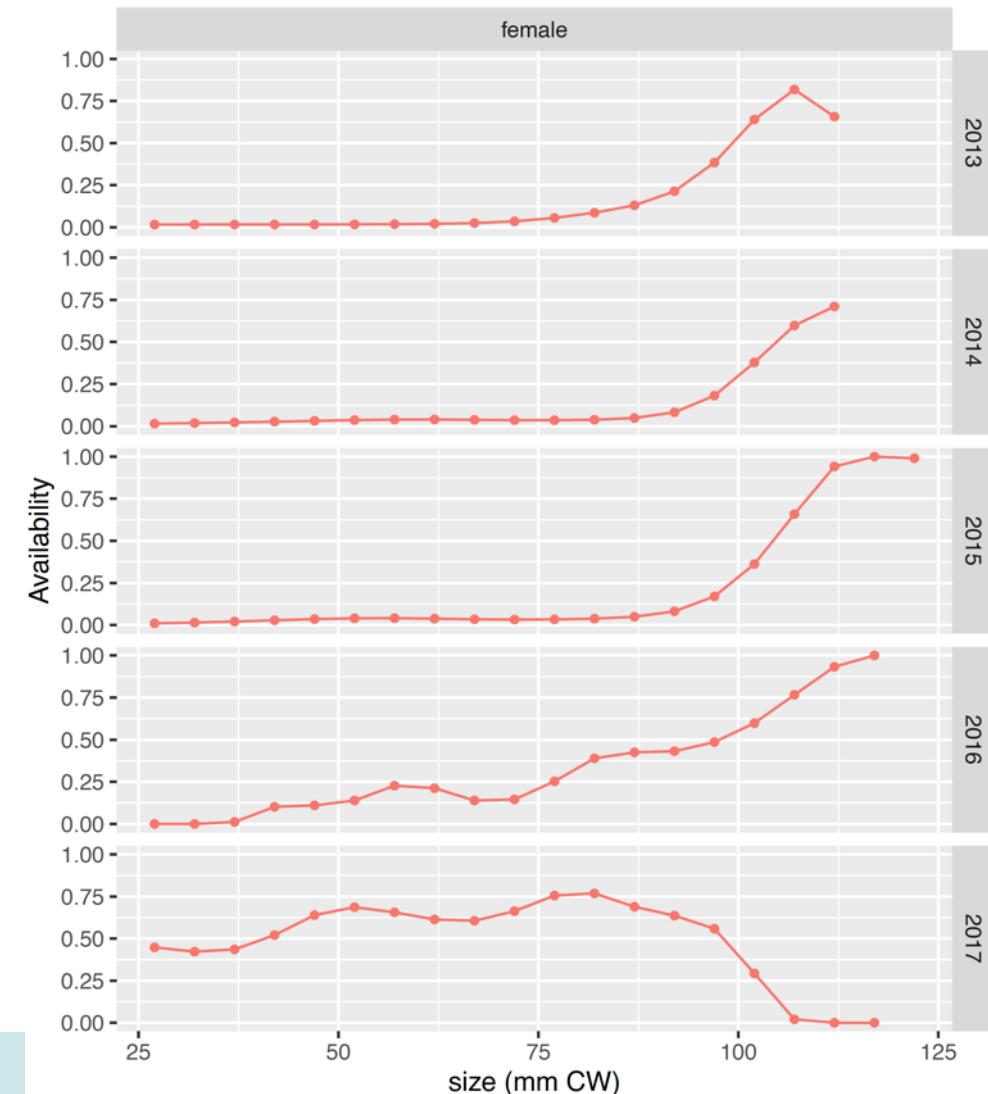

Empirical availability

$$A_z^{SBS} = \frac{N_z^{NMFS\ SBS}}{N_z^{NMFS\ EBS}}$$

SBS BSFRF males

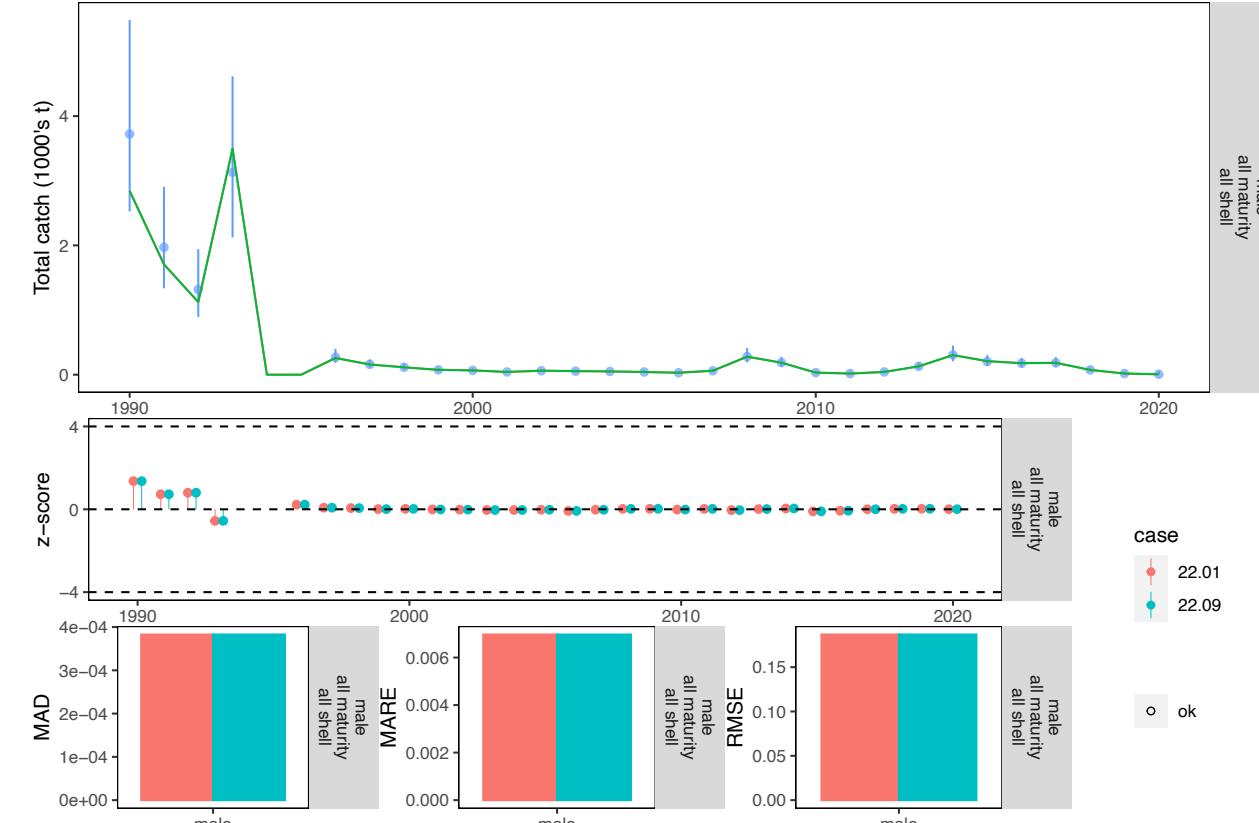

SBS BSFRF females

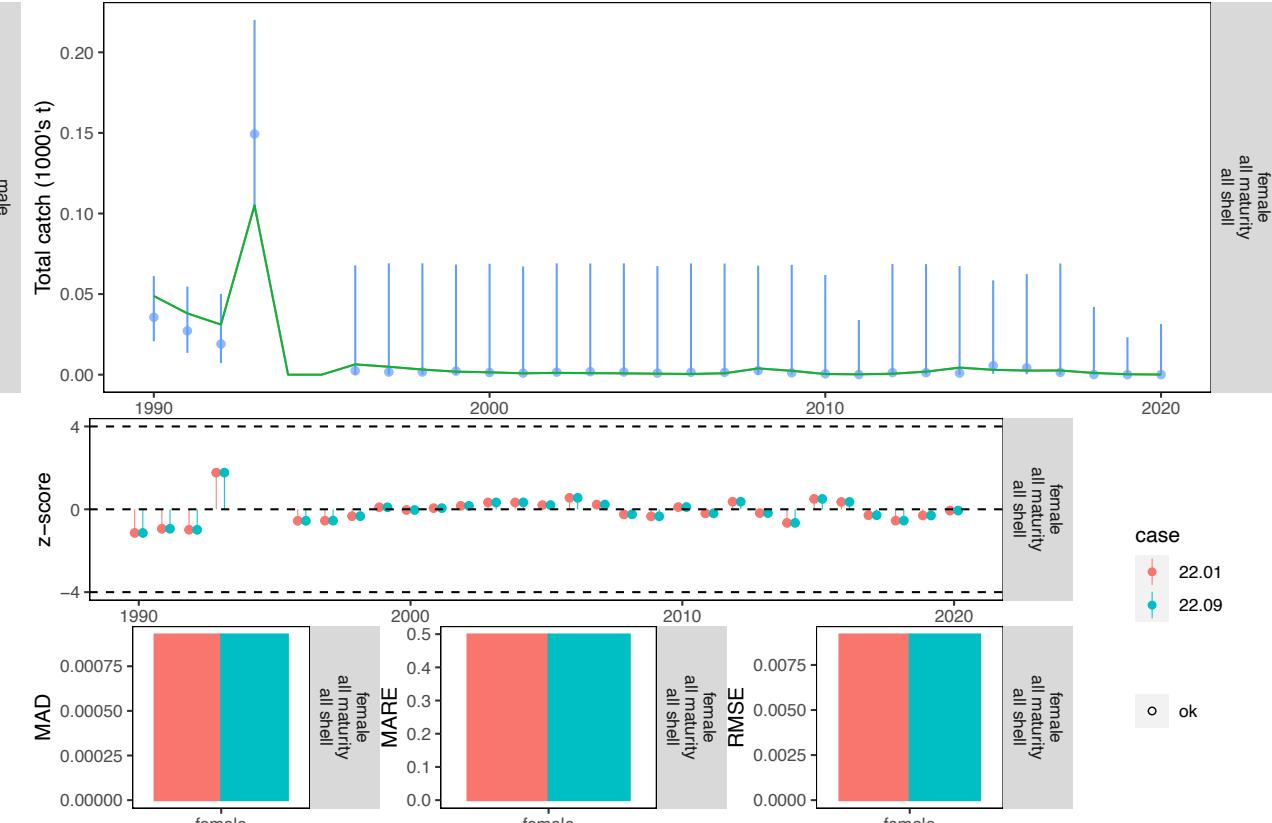

Fits to Data: Bycatch in BBRKC Fishery (22.01, 22.09)

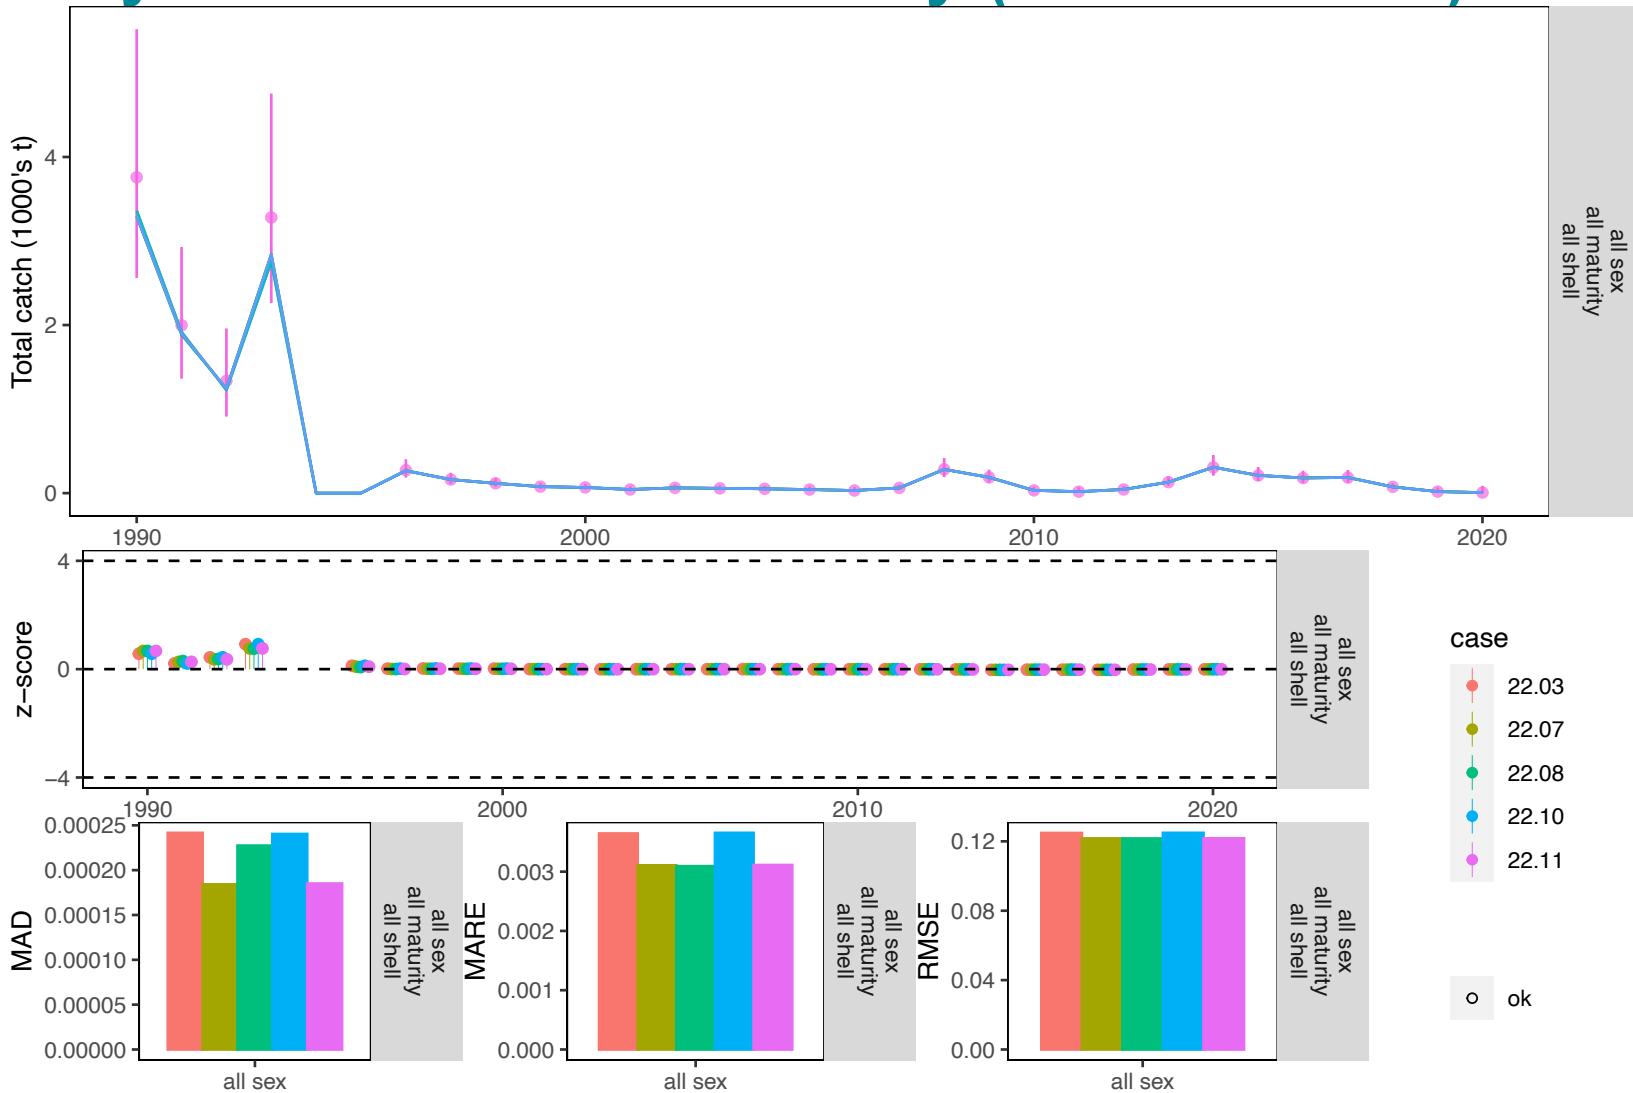

Males

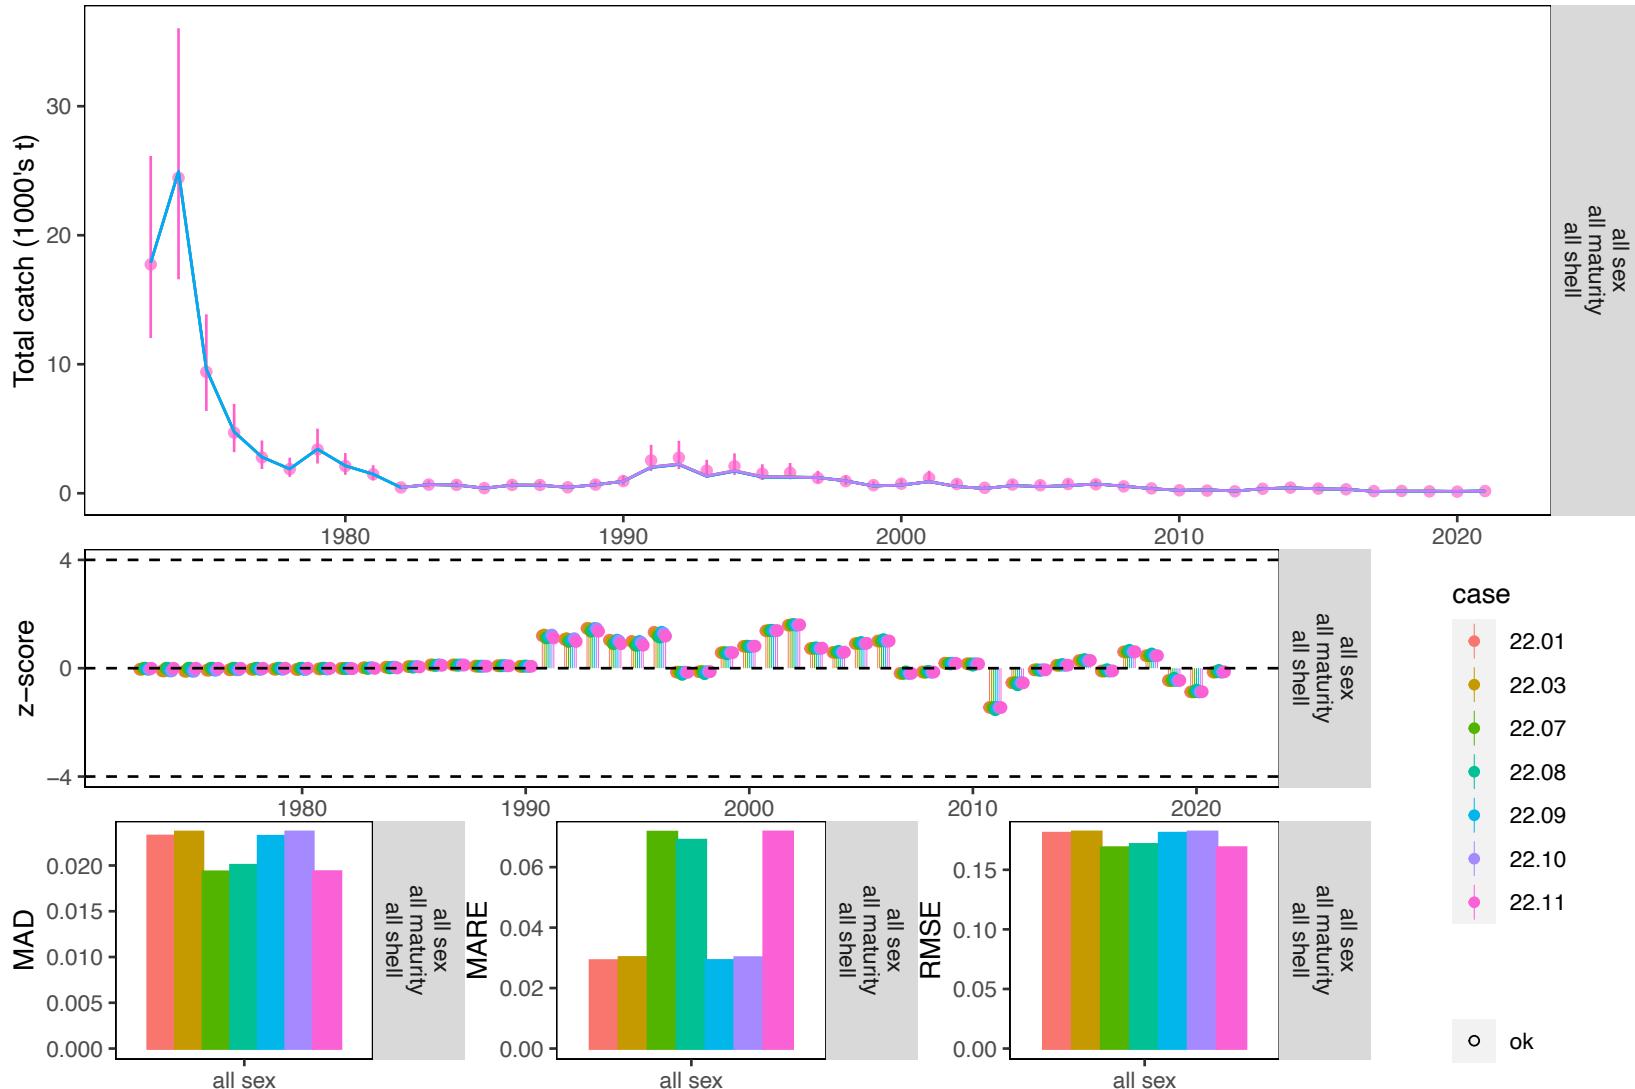

Females

Fits to Data: Bycatch in BBRKC Fishery (other models)

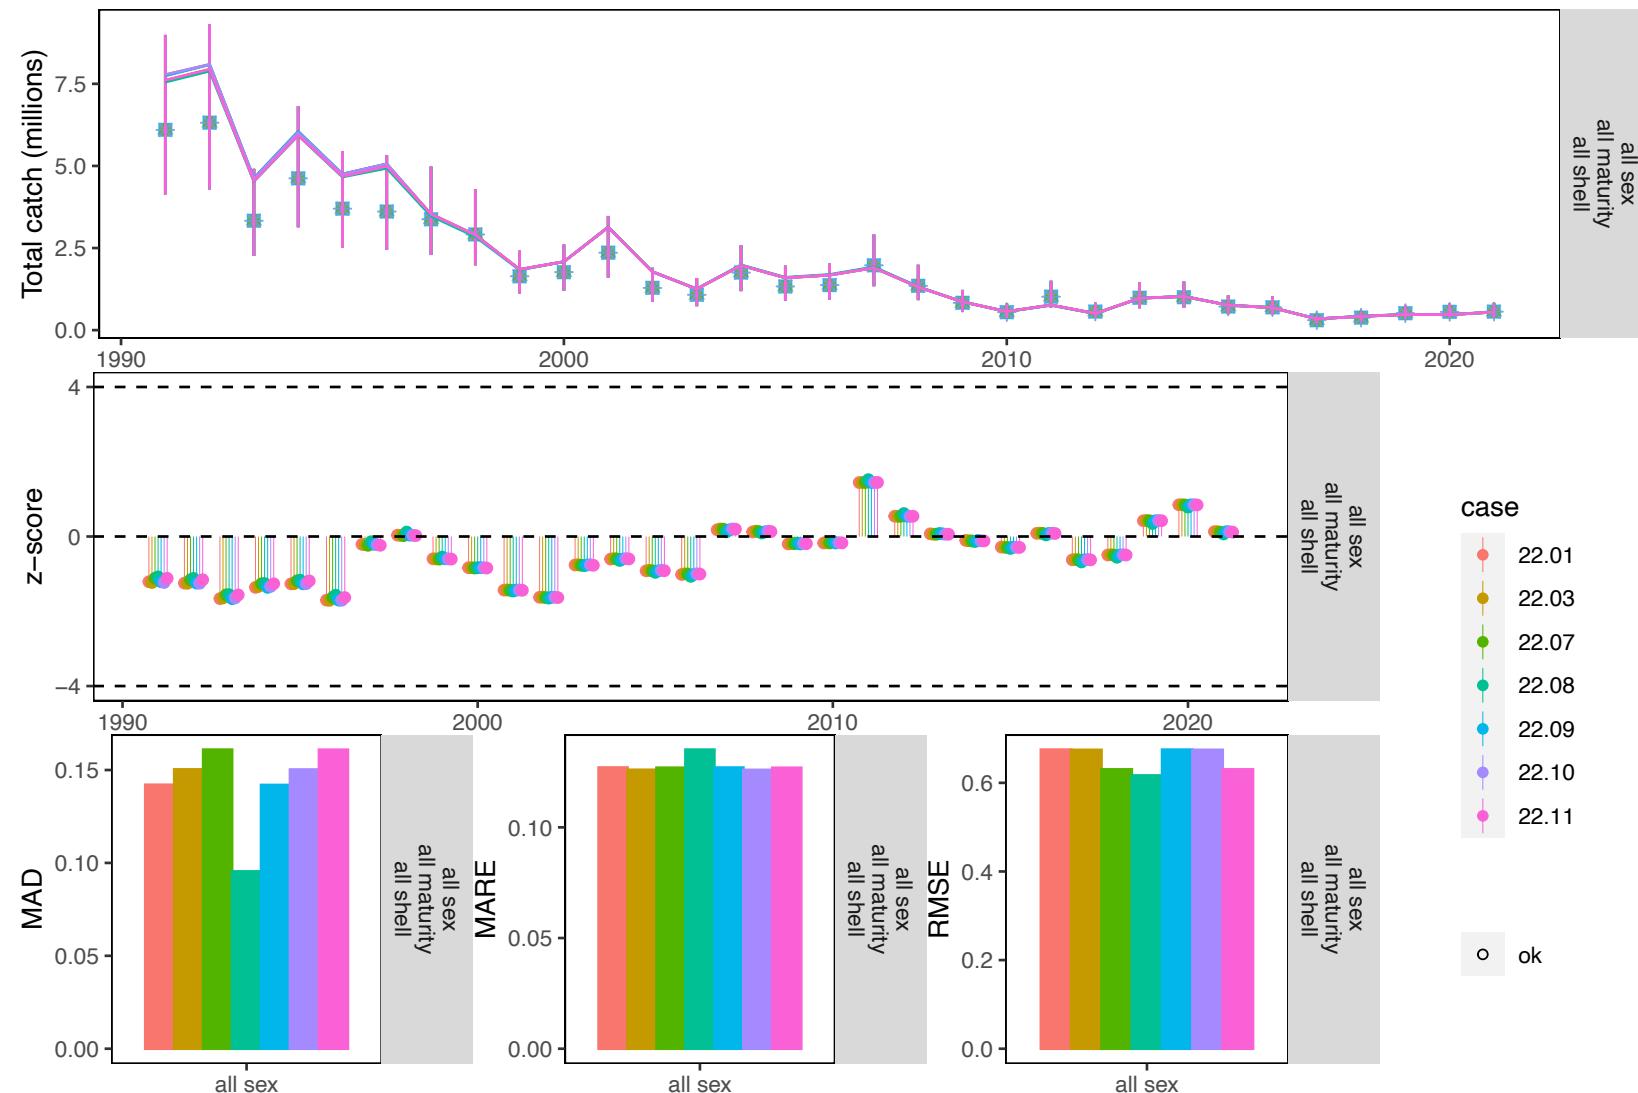

Fits to Data: Bycatch in Groundfish Fisheries (Biomass)

NOAA FISHERIES

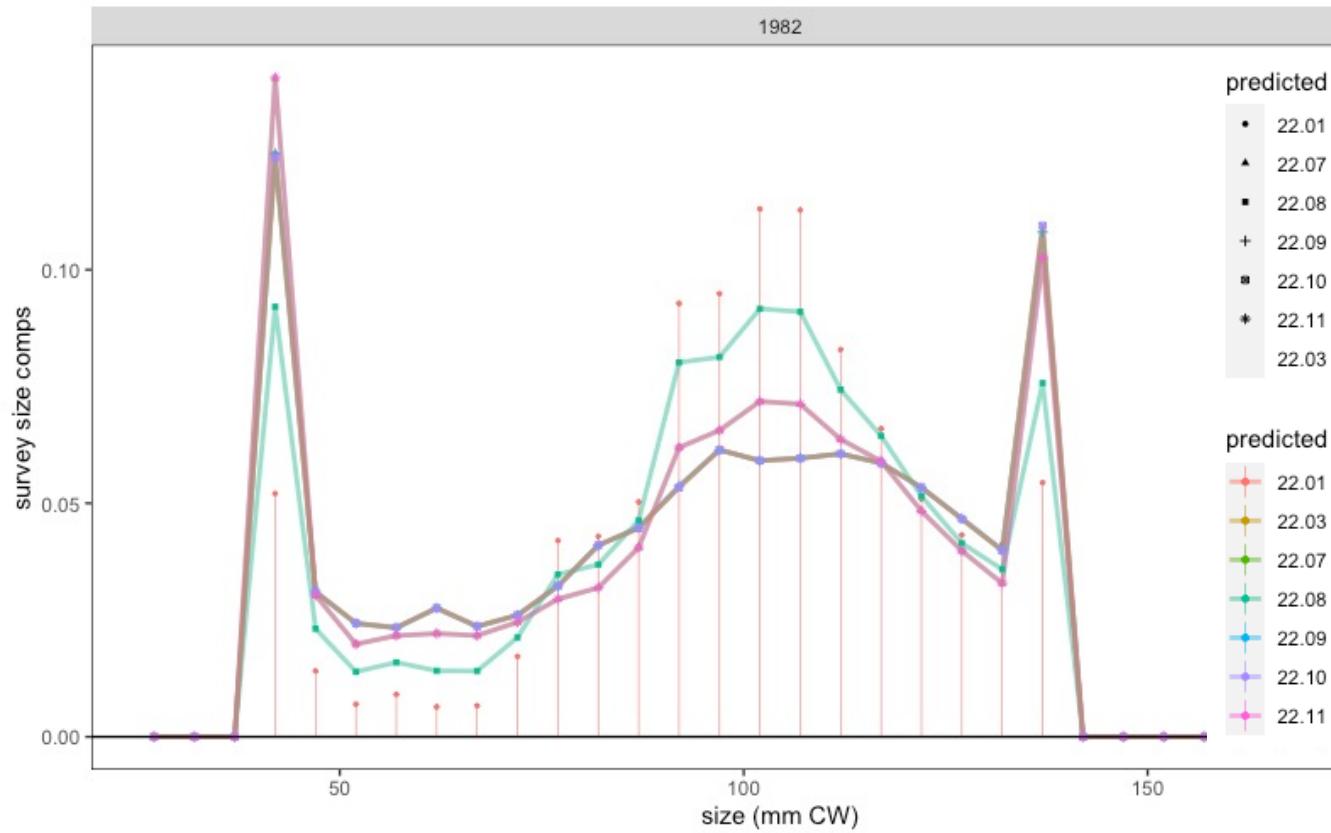

Fits to Data: Bycatch in Groundfish Fisheries. (Abundance)

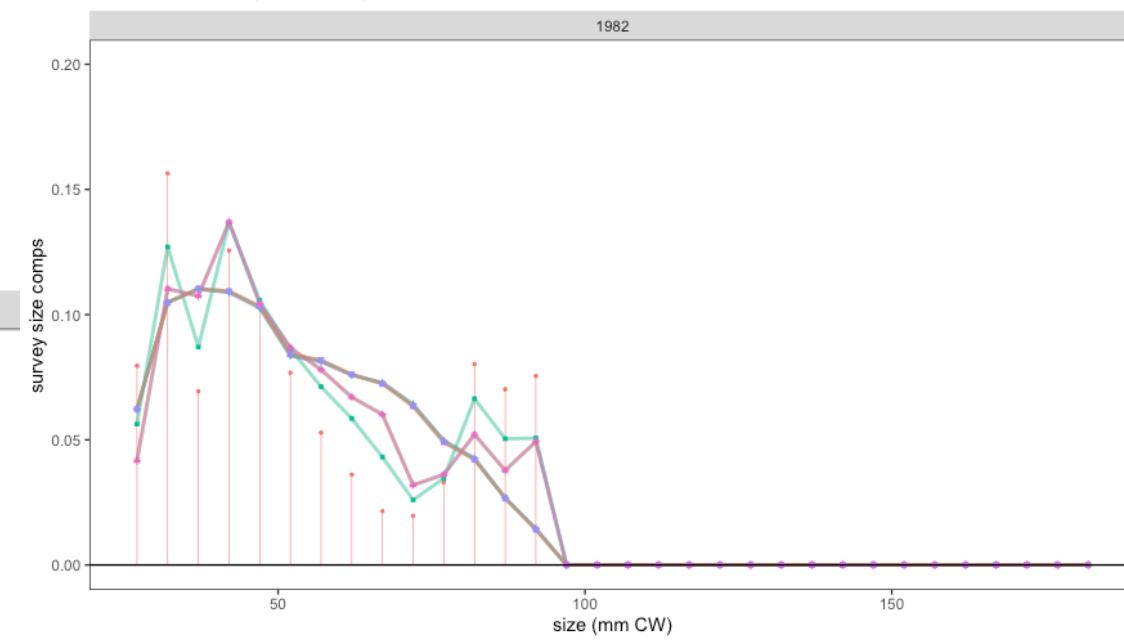

NOAA FISHERIES

Fits to 1982 NMFS survey size comps

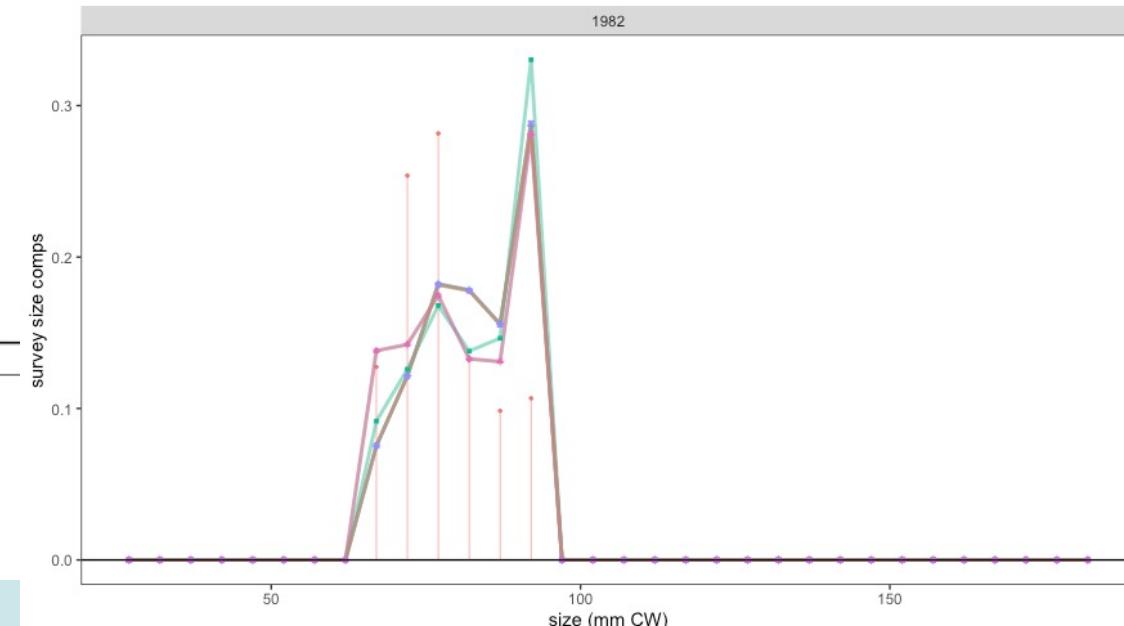

NMFS M: male, all maturity, all shell

NMFS F: female, immature, all shell

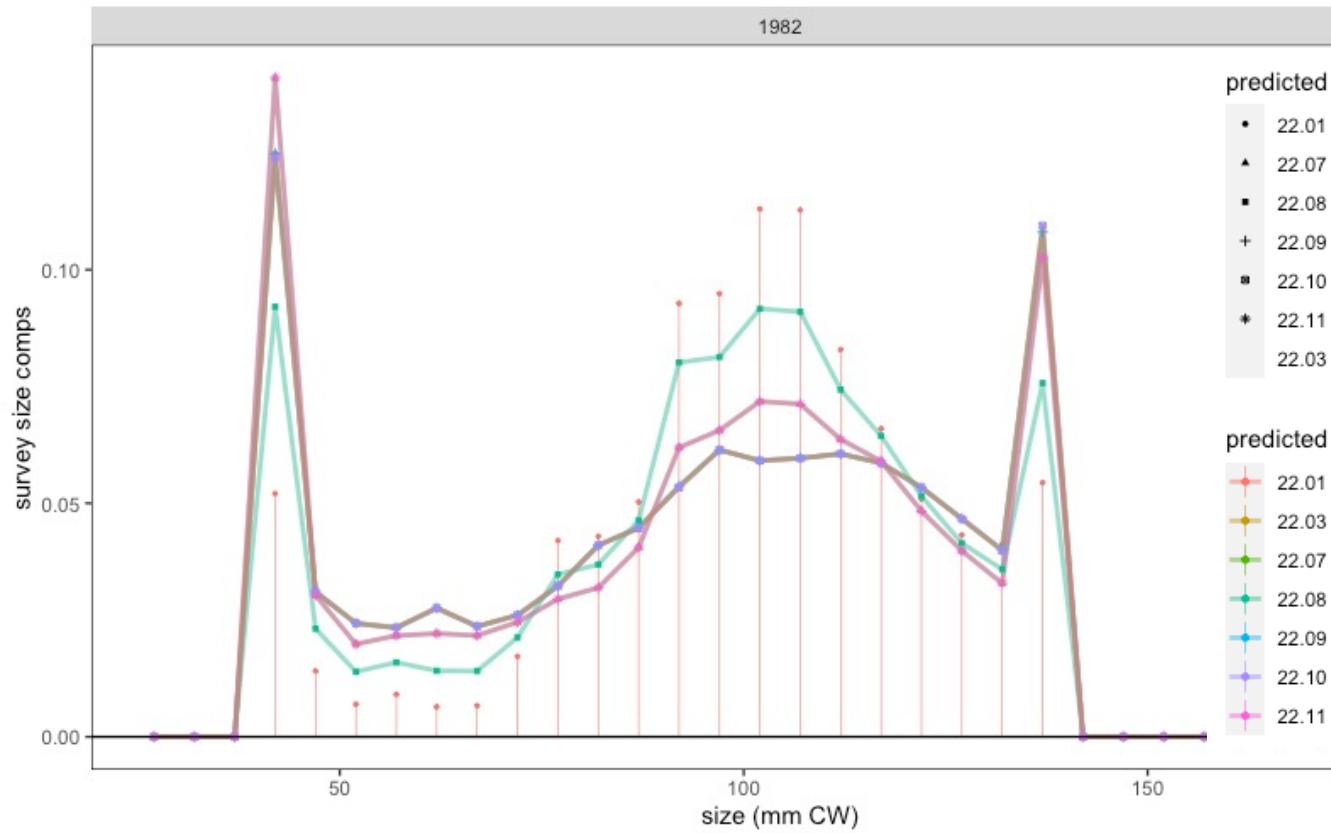

NMFS F: female, mature, all shell

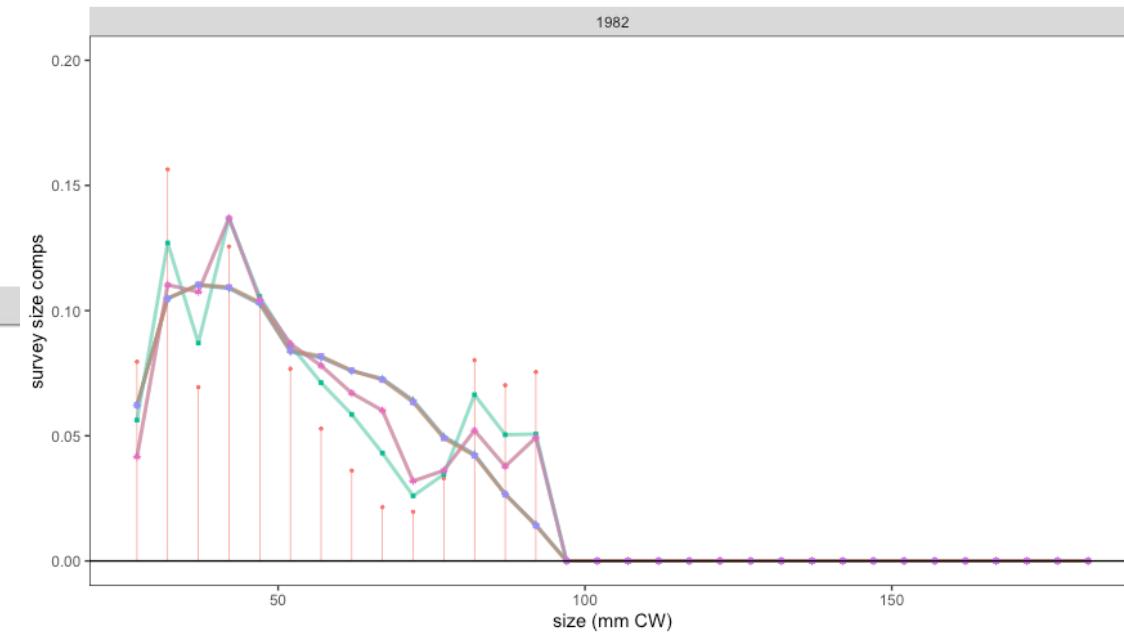

NOAA FISHERIES

Fits to 1982 NMFS survey size comps

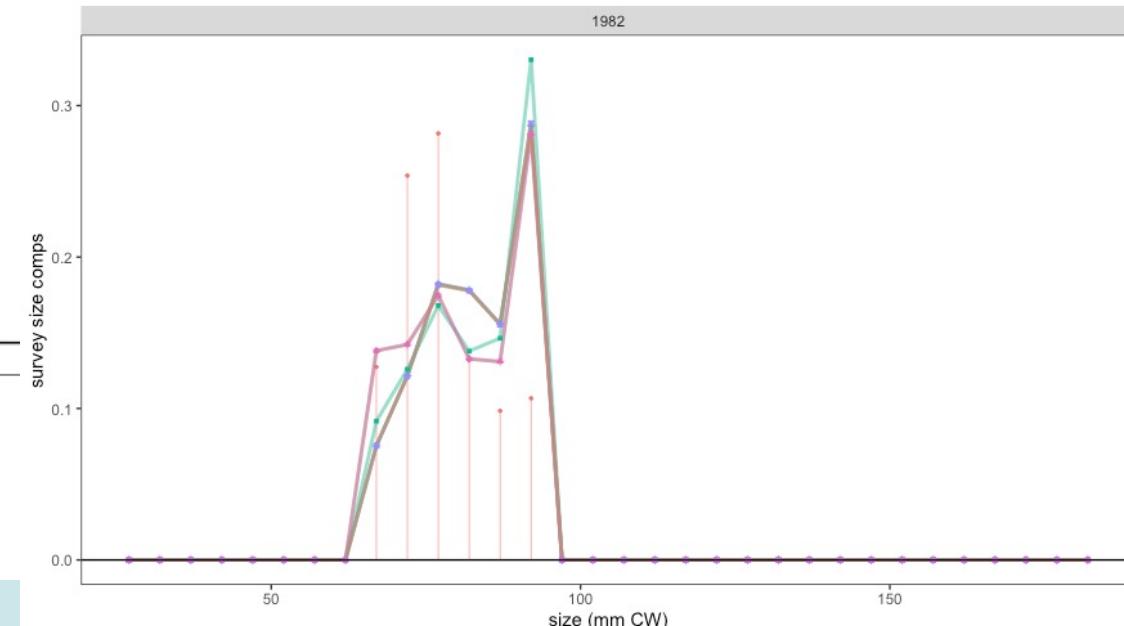

NMFS M: male, all maturity, all shell

NMFS F: female, immature, all shell

NMFS F: female, mature, all shell

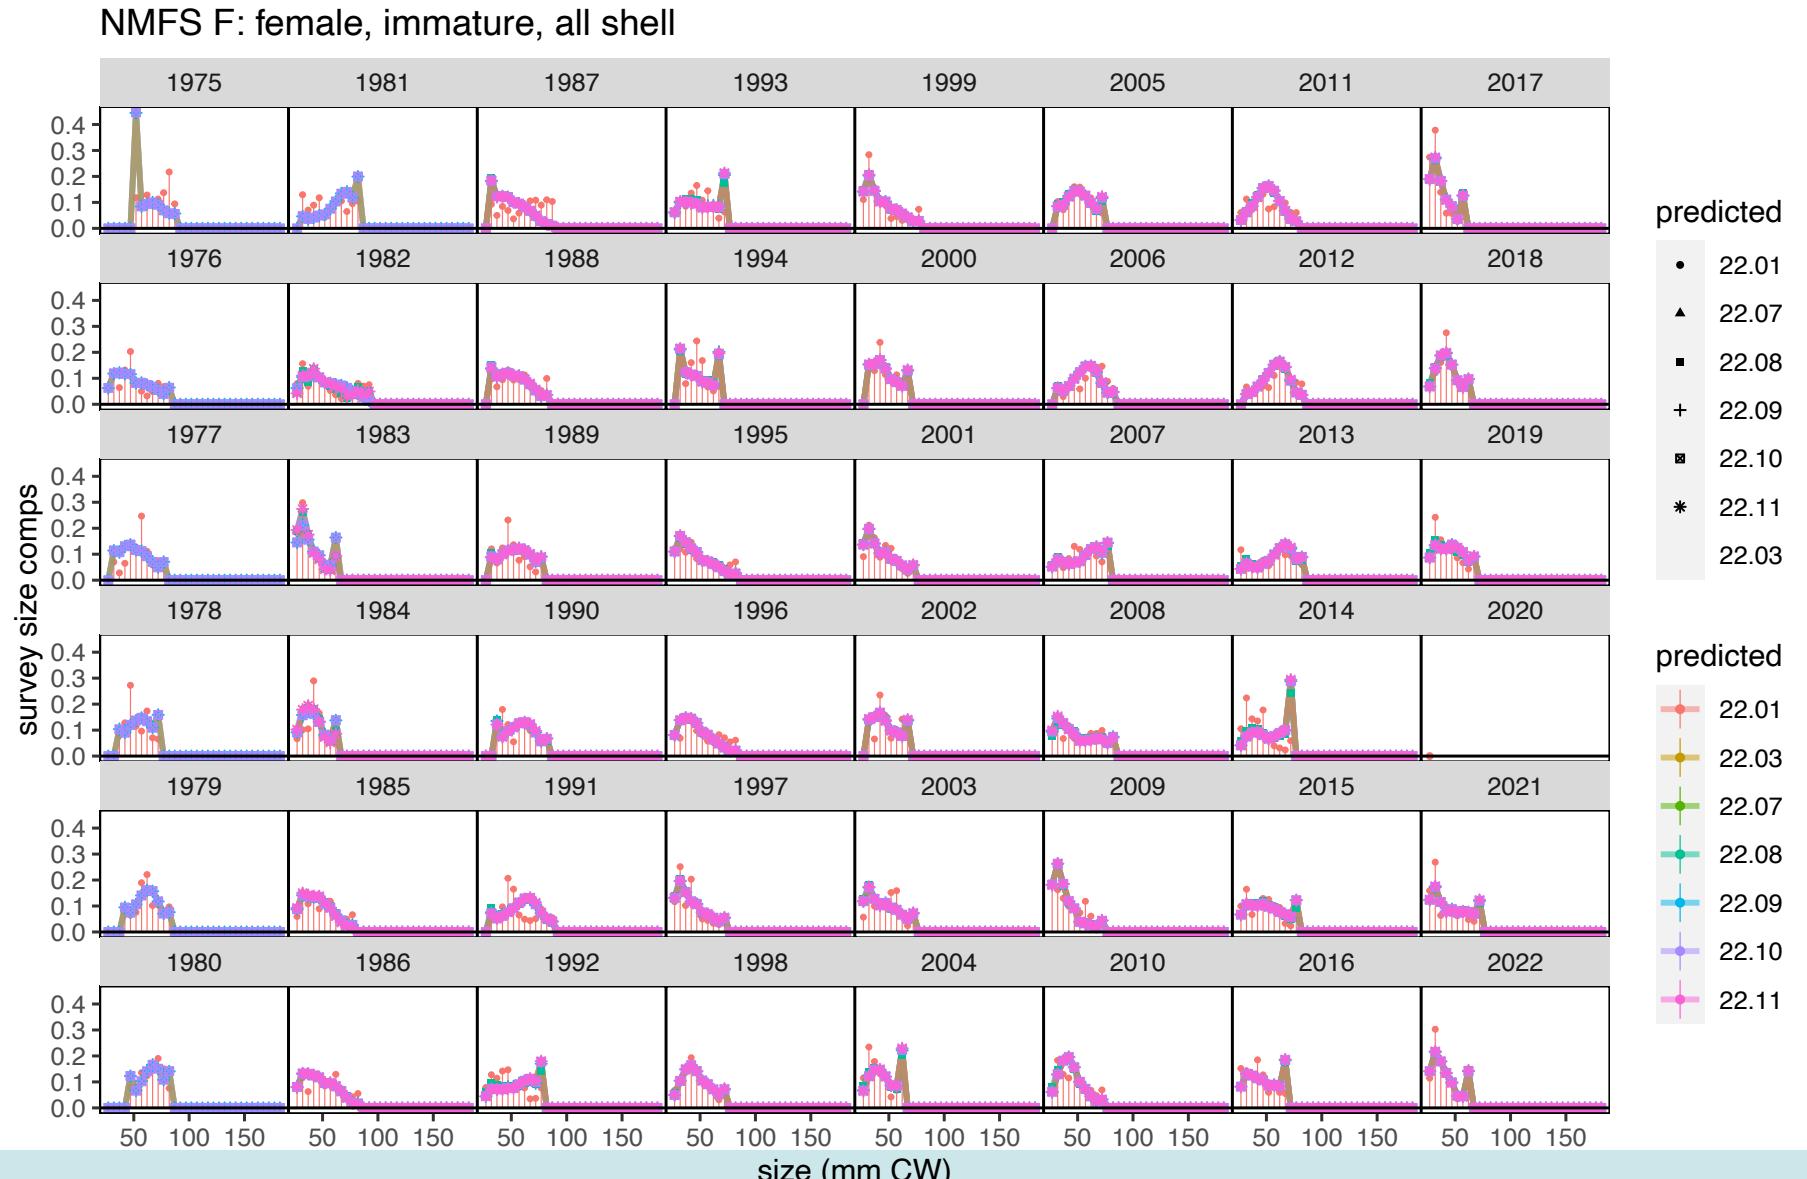

NOAA FISHERIES

Fits to Data: NMFS Survey Mature Female Size Comps

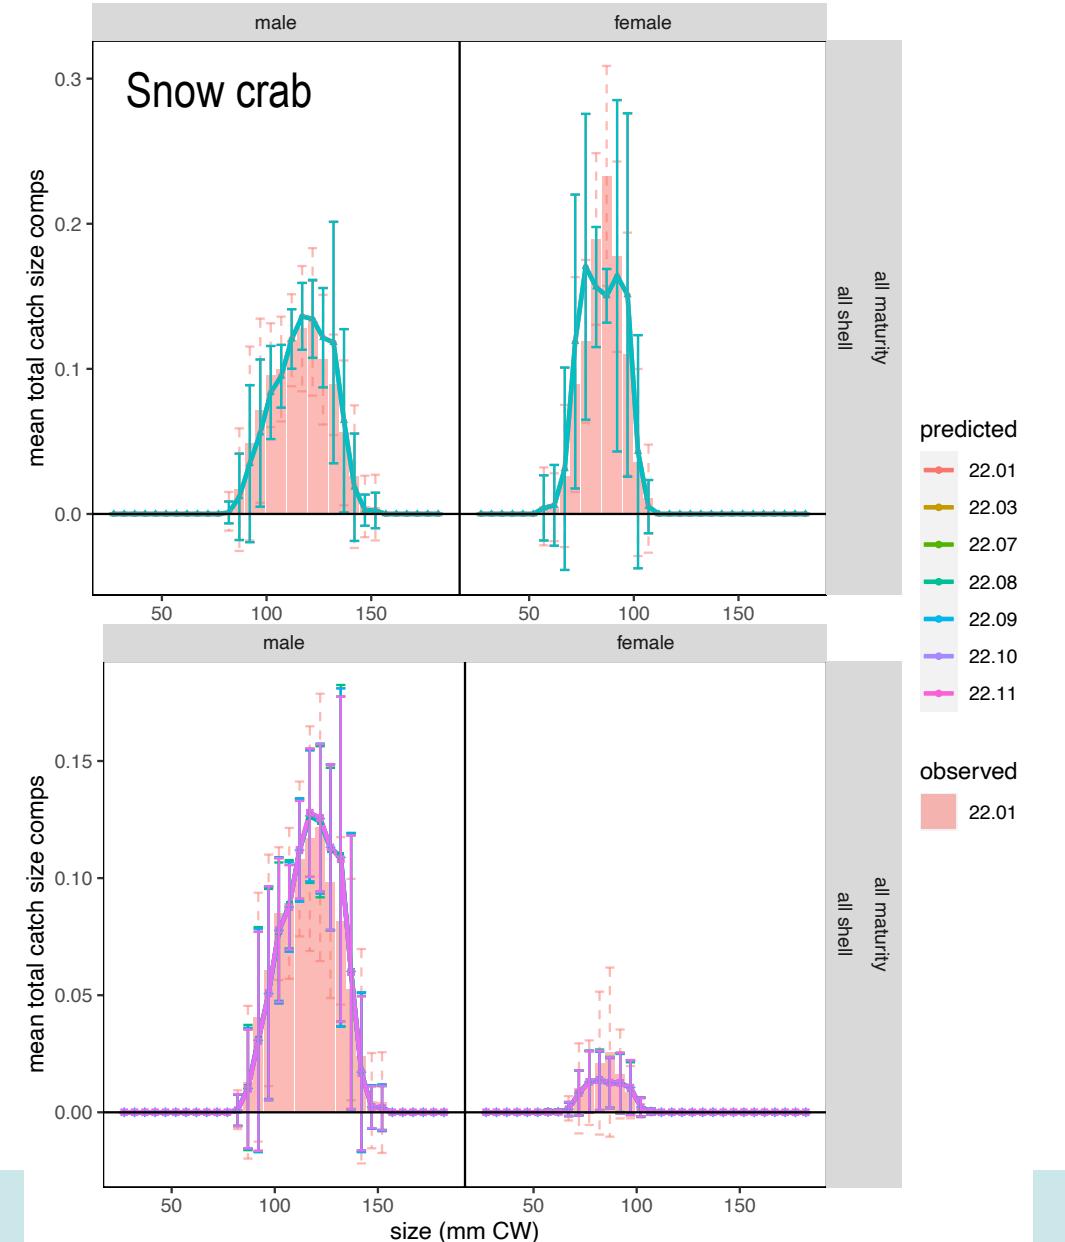

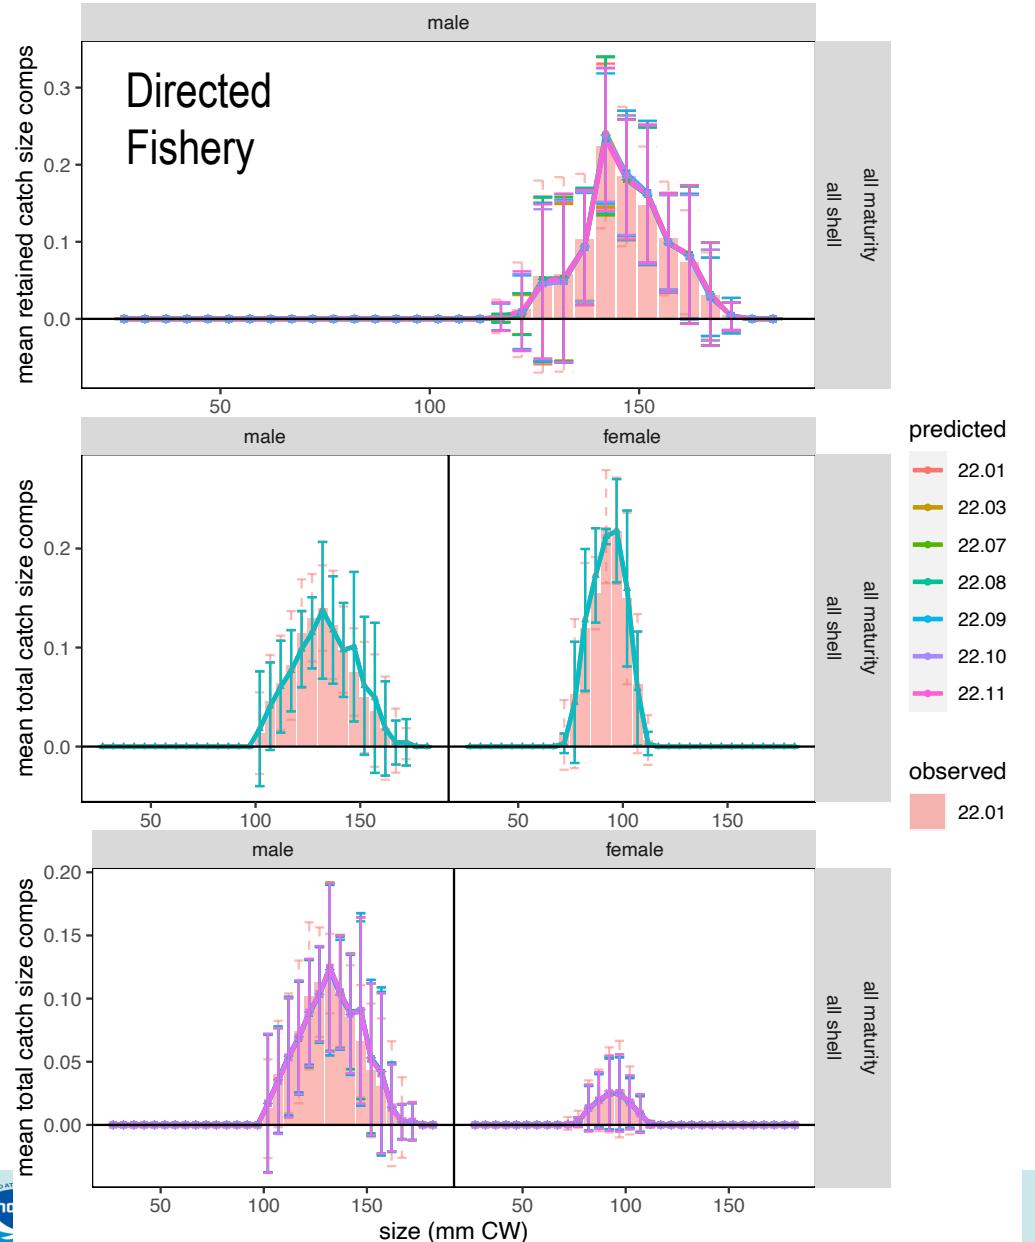

NMFS F: female, mature, all shell

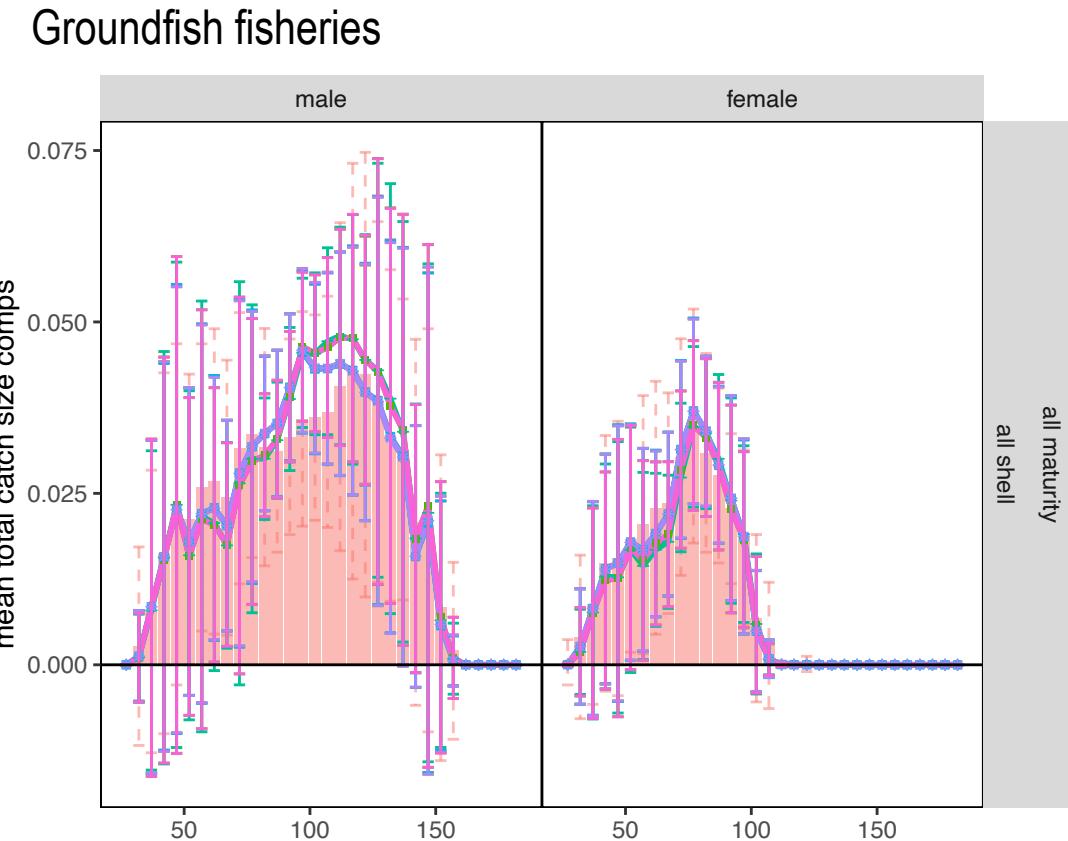

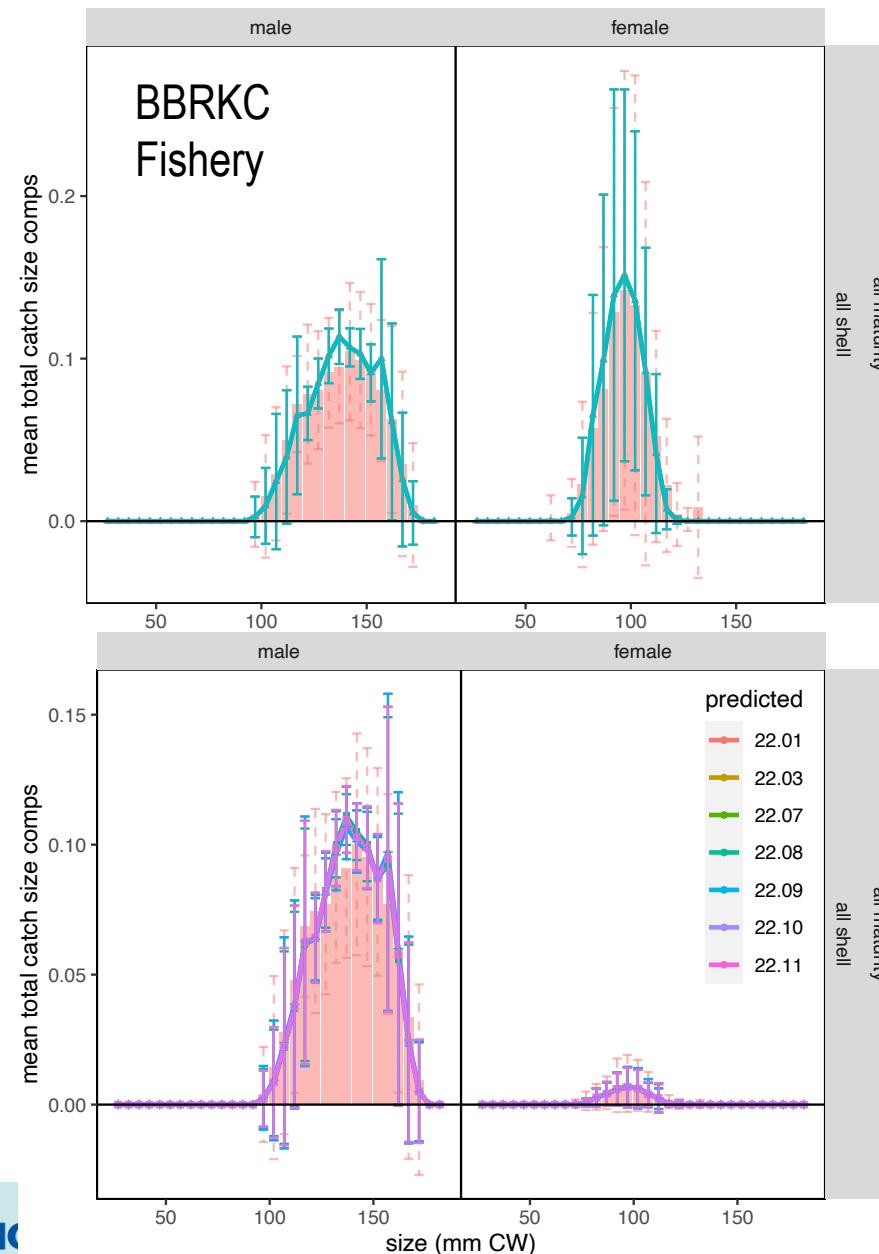

Fits to Data: NMFS Survey Immature Female Size Comps

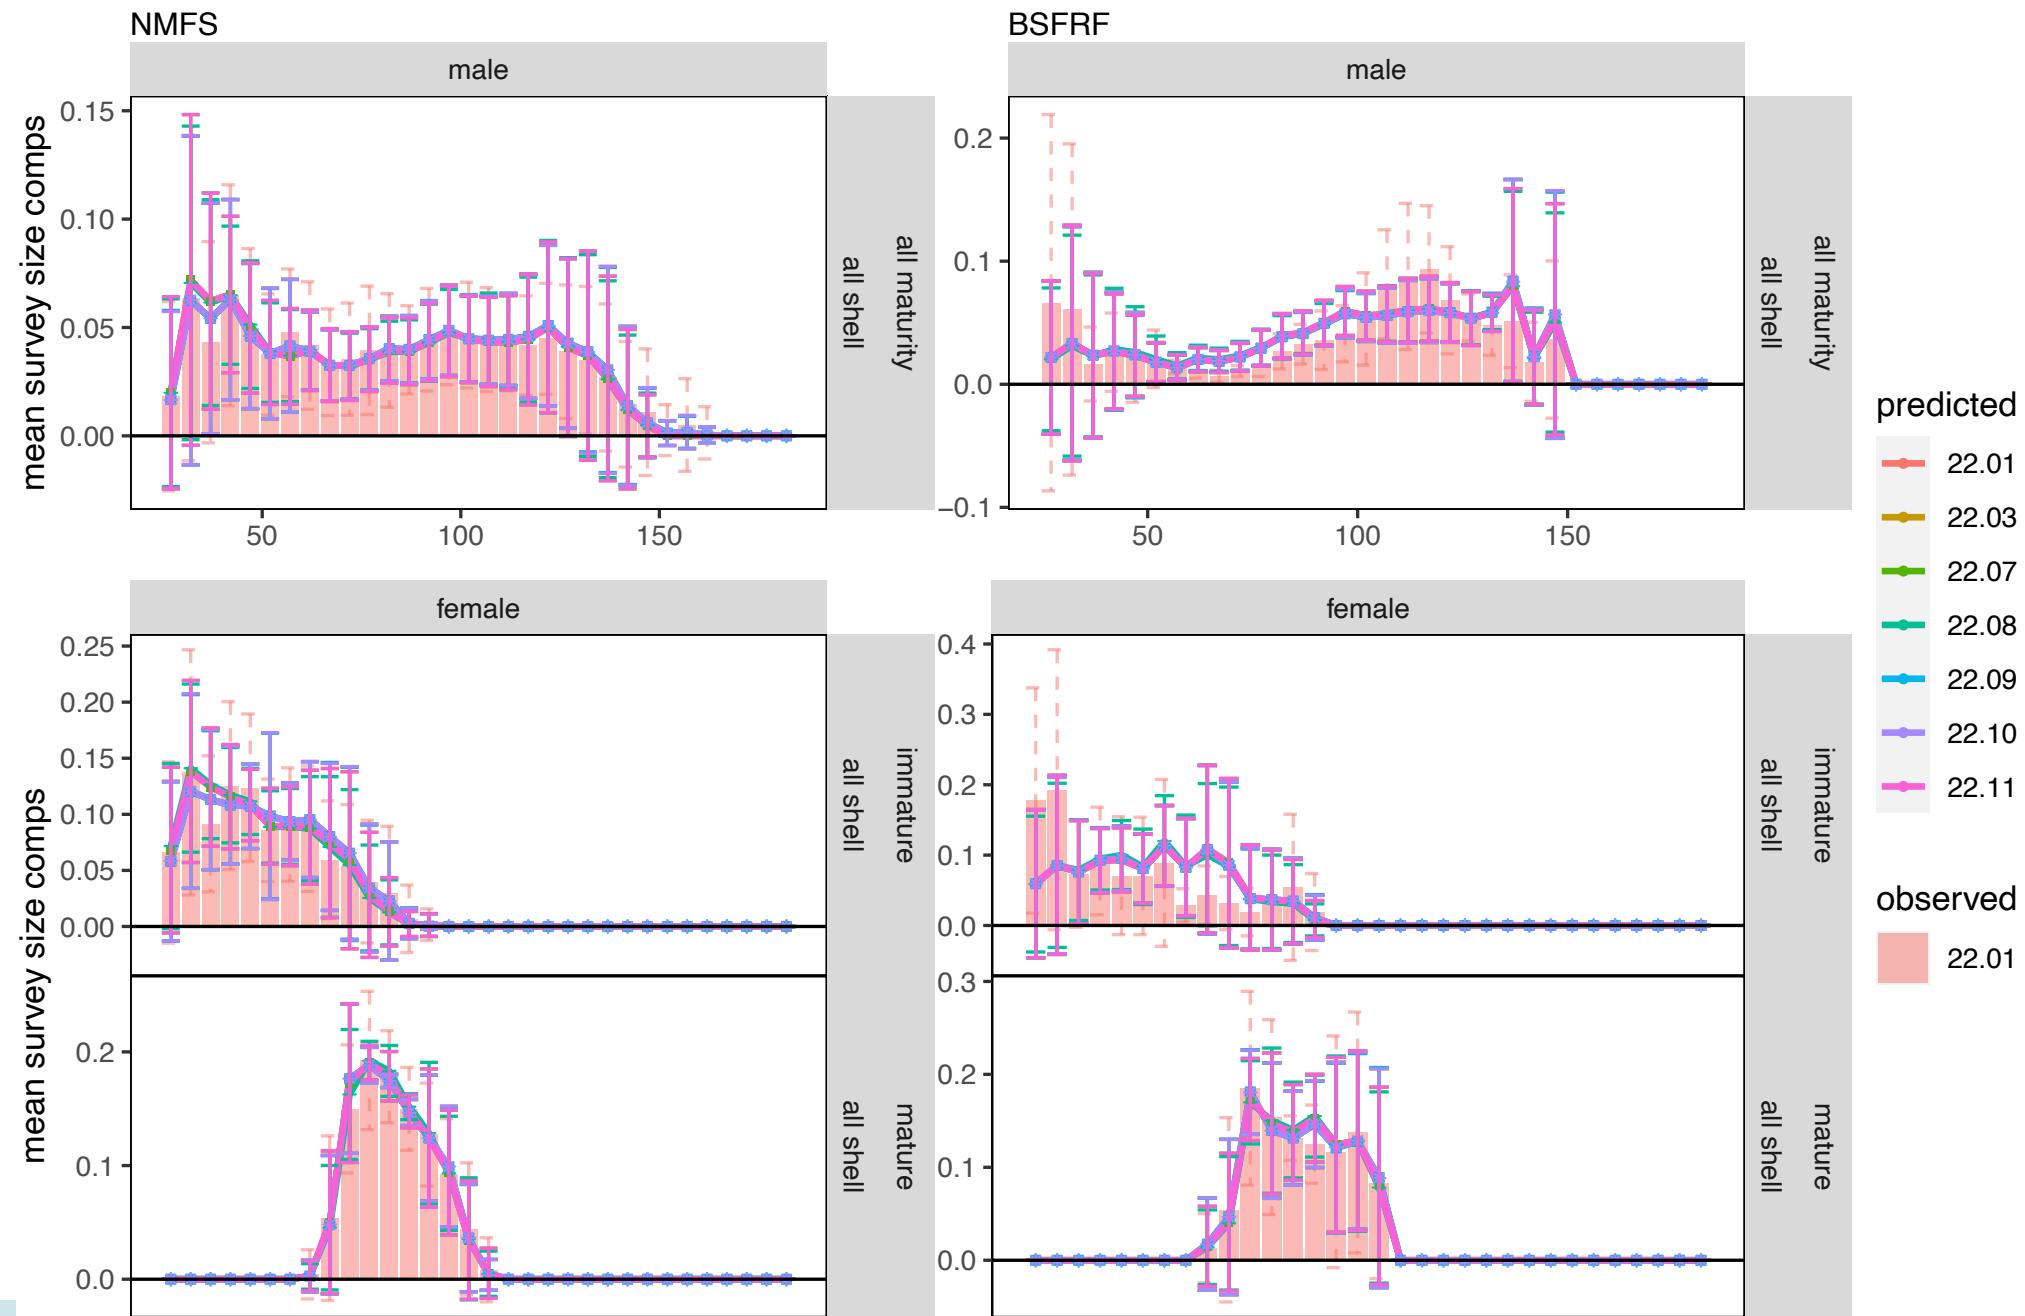

Fits to Data: Mean Fishery Catch Size Comps

Fits to Data: Mean Fishery Catch Size Comps

Fits to Data: Mean Survey Size Comps
