FISHERIES

2019 Gulf of Alaska Pacific cod

Steve Barbeaux, Kerim Aydin, Ben Fissel,
Kirstin Holsman, Ben Laurel, Wayne Palsson,
Lauren Rogers, Kalei Shotwell,
Qiong Yang, and Stephani Zador

What is a marine heatwave?

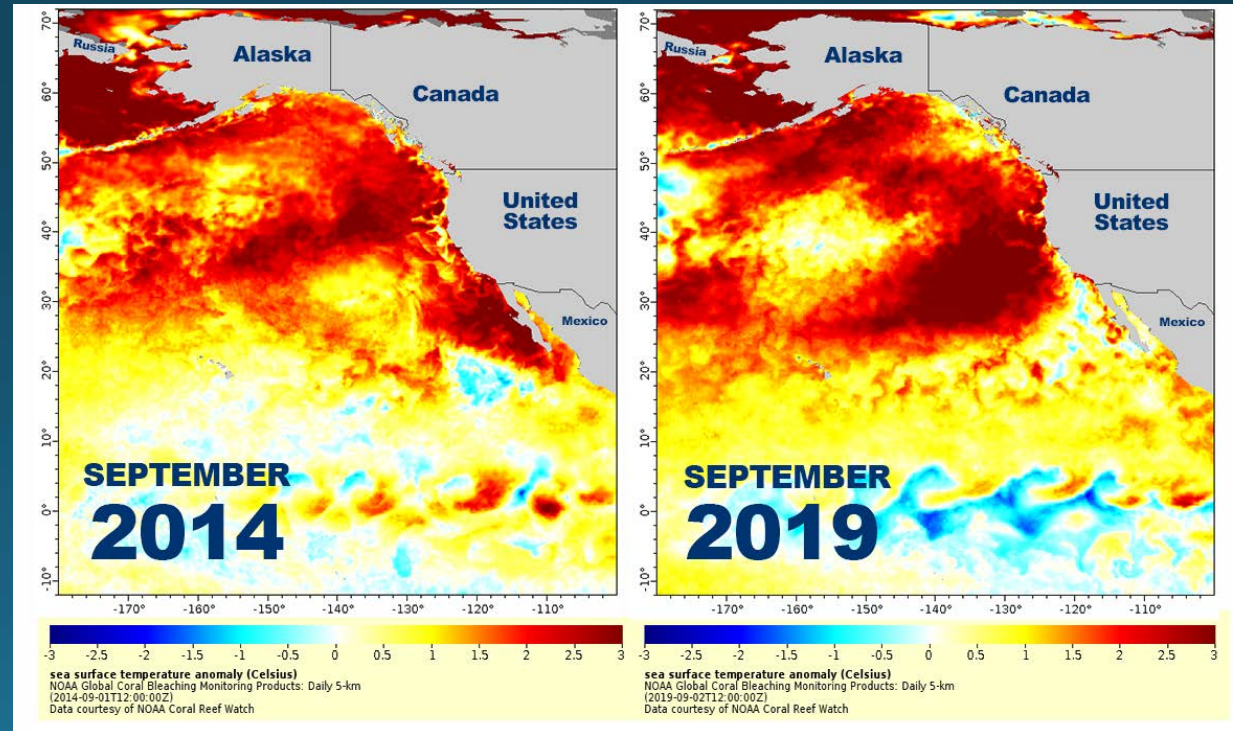

When seawater temperatures exceed a seasonally-varying threshold (usually the 90th percentile) for at least 5 consecutive days. Successive heatwaves with gaps of 2 days or less are considered part of the same event (Hobday et al. 2016).

Anomalously warm waters 2018-2019

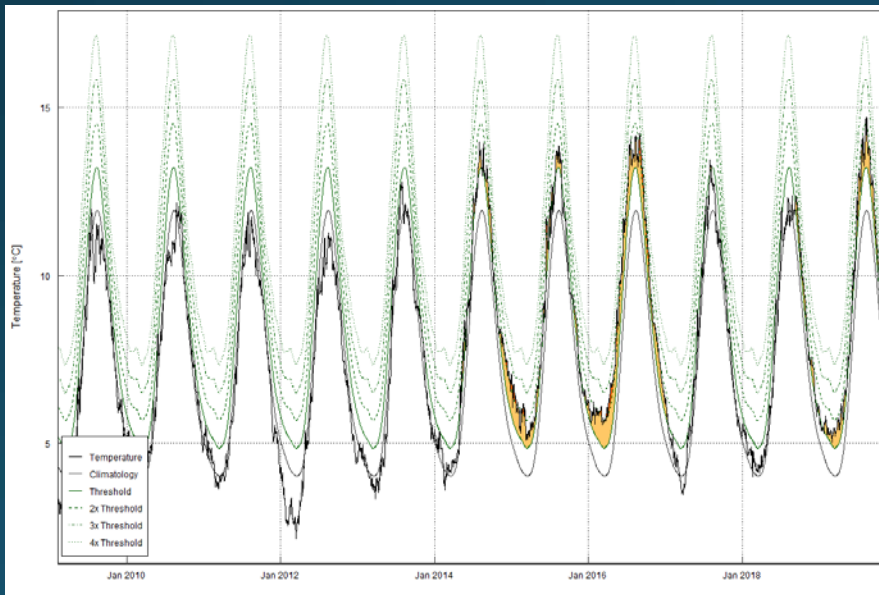

- New heatwave began September 10, 2018
- Summer of 2019 surface temps were warmer than “blob” years.

Marine heatwave index

- NOAA high resolution blended analysis data for the Central GOA
 - Daily mean SST (1 September 1981 - 4 November 2019)
- Sum of the annual marine heatwave cumulative intensity ($^{\circ}\text{C}$ days)
 - 1982-2012 baseline
 - Above 90th percentile for more than 5 days
 - “Winter” defined as Jan-Mar and Nov-Dec for a given year

Temperature [°C]

Other indicators 2019

- Juvenile forage

- Copepod community size anomalies were larger for the Alaskan Shelf and oceanic habitats in 2017
- Euphausiids were at record abundance during the September 2018 Seward Line sampling
- Euphausiids abundance estimates were low in May 2019.
- Acoustically-derived estimates of euphausiid abundance during summer 2019 were moderate to low.
- The reproductive success of planktivorous auklets at the Semedi Islands was average

- Foraging conditions for adult cod

- Forage fish indicators suggest mixed signals for abundance during 2019.
 - Spring and late summer surveys for young-of-year groundfish found very few.
 - Forage-fish eating seabirds at the Semidis had strong reproductive success, although observations indicated that diets were unusual relative to other years.

New data for 2019 in assessment model

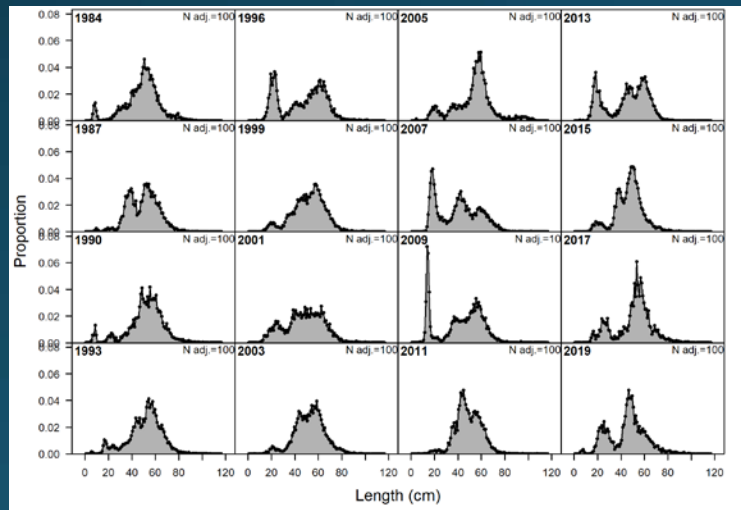

- 2019 AFSC bottom trawl survey
 - Abundance Index 1990-2019
 - Length composition
- 2019 AFSC longline survey
 - RPN Index 1990-2019
 - Length composition
- 2010-2011 and 2018 fishery conditional age at length
- 2018-2019 Fishery catch and length composition

GOA Pacific cod 2019 AFSC Bottom trawl survey

- 126% increase in abundance from 2017
 - 5.6×10^7 to 12.7×10^7 fish
- Second lowest biomass estimate in time series
 - 69% increase to 181,581 t
 - Highest CV in time series (0.243)

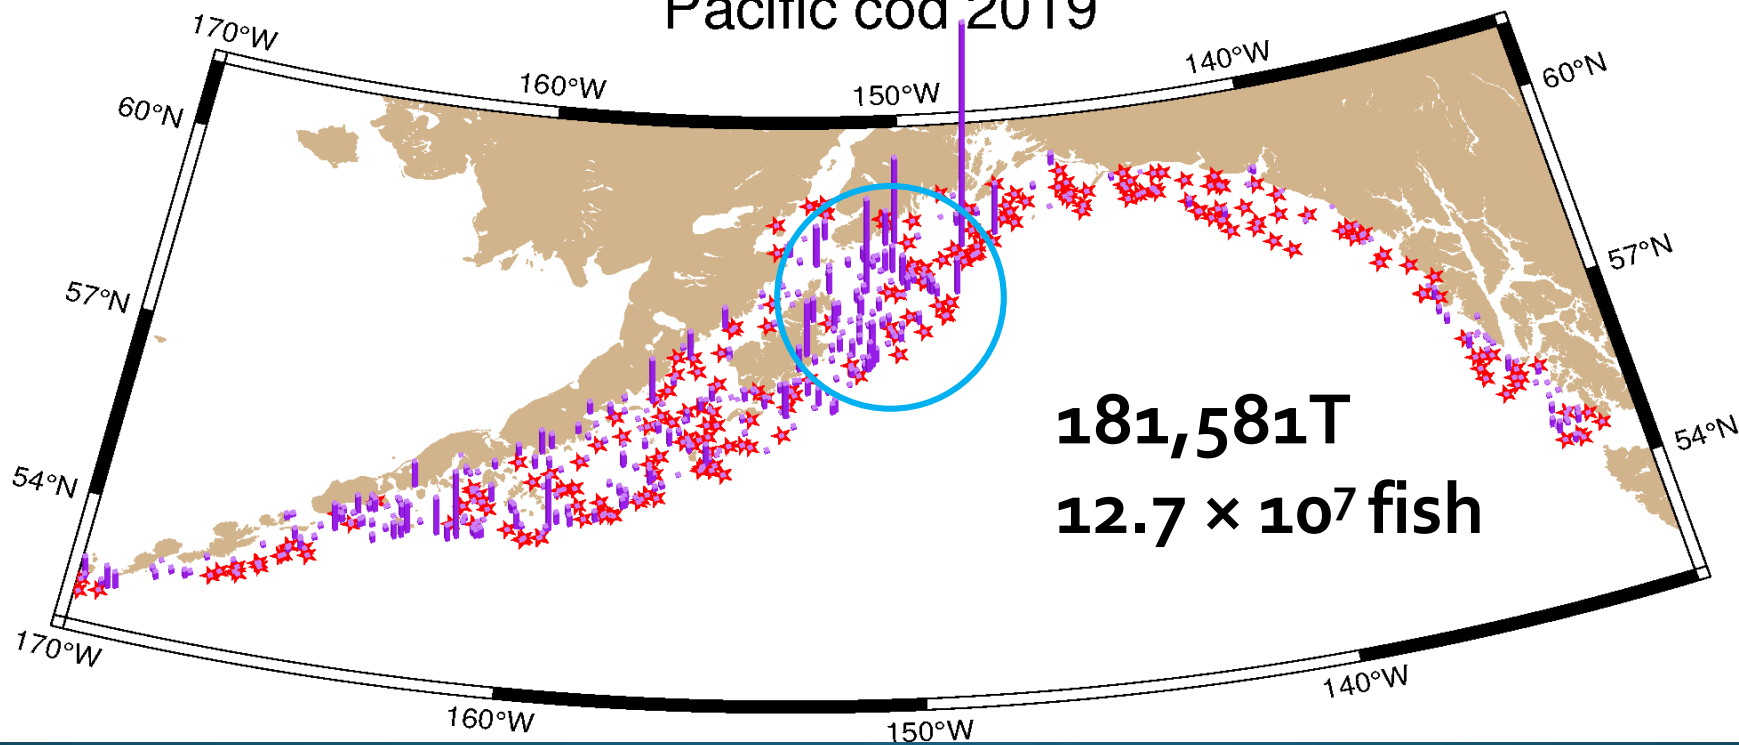

Pacific cod 2015

Pacific cod 2017

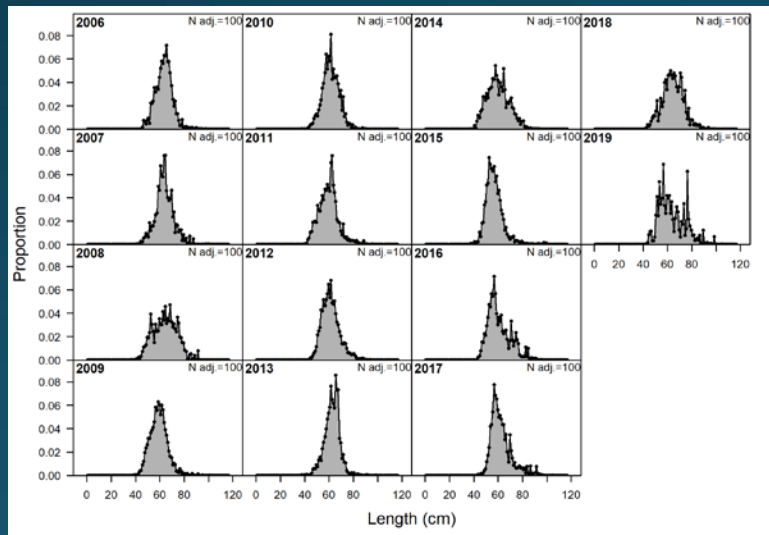

Pacific cod 2019

AFSC longline survey

- 2019 Lowest index value in series
 - 19,933 RPN
 - 37% decline from 2018
 - 83% decline since 2015
- Survey of large cod
 - Deep > 150 m depth
 - > ~40 cm

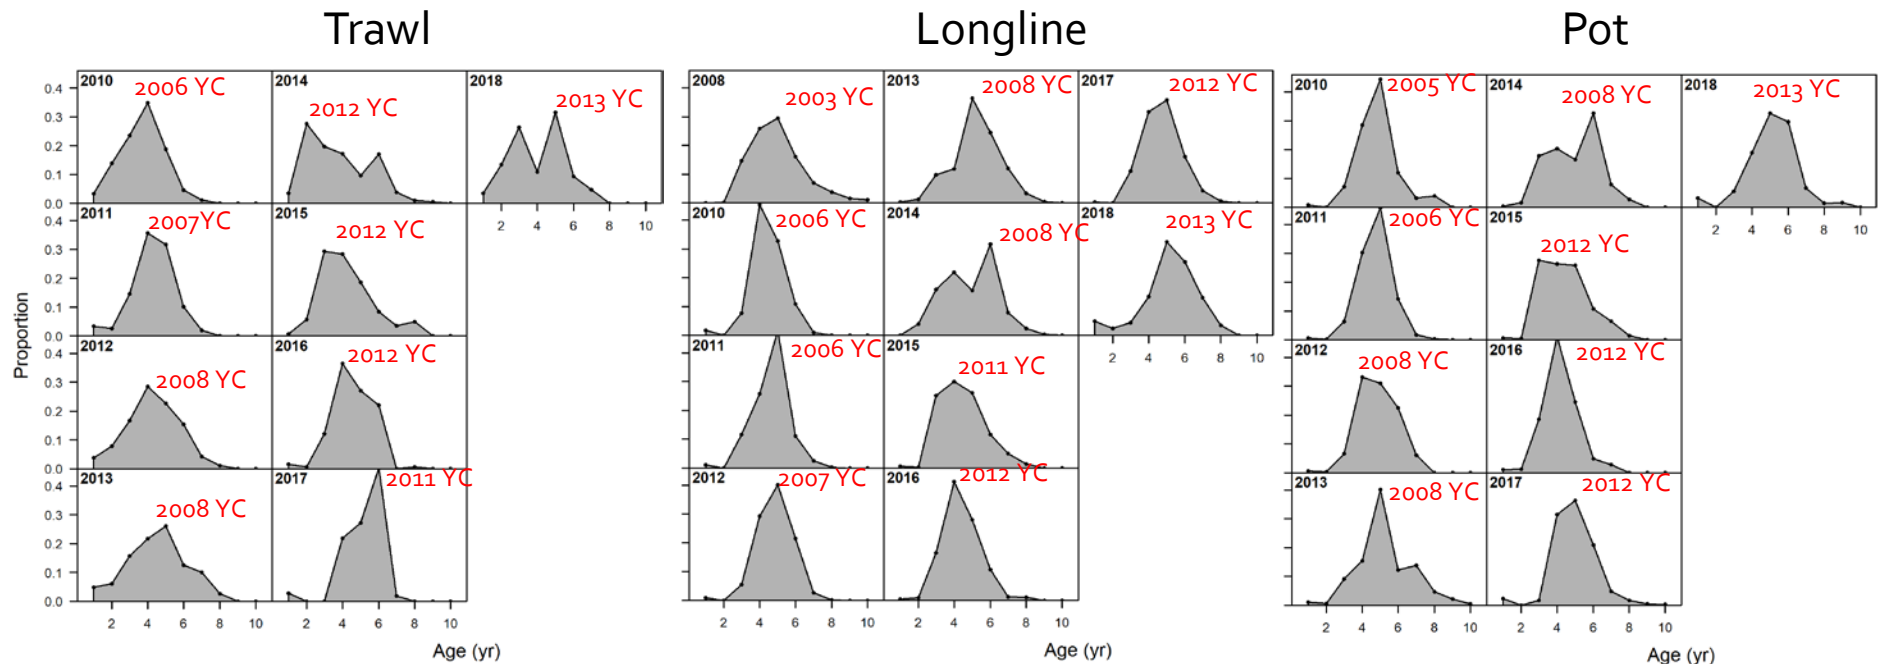

Fishery age composition data

- Based on annual fishery-specific age-length key

Note that in the Bering Sea large year classes are 2011 and 2013

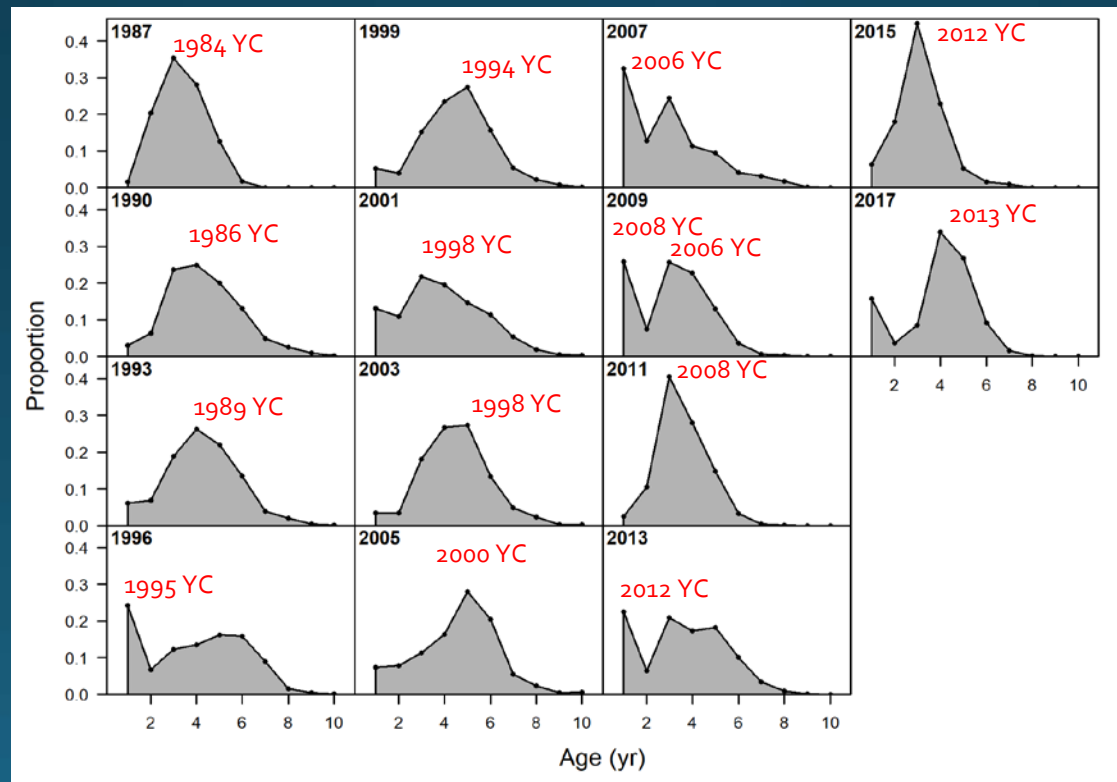

Survey age composition 1990-2017

- Change from dominant 2012 to 2013 year classes between 2015 and 2017
- 2019 age data not yet available.

Note that in the Bering Sea large year classes are 2011 and 2013

New ancillary data for 2018

- 2019 IPHC longline survey
 - RPN Index
 - No length composition data available yet
- 2019 ADF&G large-mesh trawl survey
 - Random effects model biomass Index
 - Length composition
- Fishery CPUEs
- Bycatch rates
 - Encounter rate in GOA pollock fishery
 - Catch rate in GOA shallow water flatfish fishery
- Pacific cod body condition
- Larval surveys
 - 2019 Ichthyoplankton survey
 - 2019 GOA beach seine studies

INTERNATIONAL PACIFIC

HALIBUT COMMISSION

IPHC longline survey 1997-2019

- Surveys GOA shelf area
 - Comparable to AFSC bottom trawl survey
 - 2017 lowest in time series
 - 7.9% increase from 2018 to 2019
 - Highest cv of time series (0.25)

ADF&G large-mesh trawl survey 1990-2018

- Generally near-shore
- Random-effects model used for index
- 2016 lowest relative biomass estimate in series
- 16.4% decrease from 2018 to 2019

Central GOA

Western GOA

Bycatch rates in pollock and shallow-water flat fisheries

- Encounter rate in pelagic pollock fishery is a mixed signal depending on area
- Up in 610 and 630, down in 620
- Bycatch rate in shallow water flatfish fishery appears higher in 2019 compared to 2016 through 2018
- Remains low compared to prior years

Pcod bycatch in GOA pelagic fisheries 2008-2019 Jan-Feb

Pcod bycatch in GOA Shallow water flatfish fisheries 2008-2019

Pacific cod weight at length in fisheries

- Mixed seasonal signals
 - Good to average condition in the Winter/ early Spring
 - Poorer condition in the late Spring/Summer

Western GOA Longline

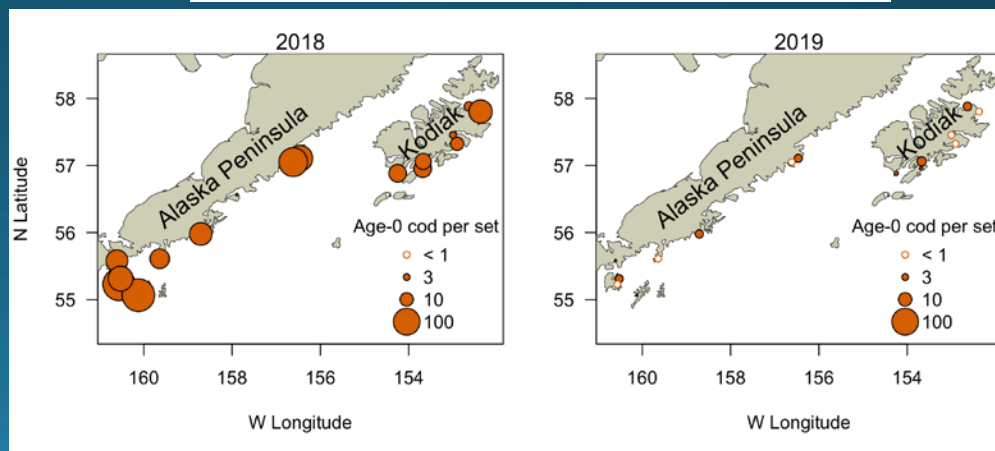

Central GOA Longline

Larval surveys

- Ichthyoplankton survey (1981-2019)
 - 2019 very low
- Age-0 Kodiak beach seine survey (2006-2019)
 - 2019 very low
- Age-0 western GOA beach seine survey (2018-2019)
 - 2019 order of magnitude lower than 2018

Data used in assessments

Catch

- ABC for 2019 remained low at 17,000 t reduced from 18,000t in 2018
- Total catch in 2019 at $< ABC_{2019} \sim 15,000t$

Base Model – Model18.10.44

- Developed in Stock Synthesis
 - von Bertalanffy growth
 - $L_{50\%}$ at 53.7cm slope = -0.273657 using Stark (2007) maturity data
 - Beverton-Holt with steepness = 1.0, sigma R = 0.44
 - Heatwave block on natural mortality 2014-2016
 - Fit with lognormal $\mu = -0.81$ and SD = 0.1
 - All selectivity double normal on length composition
 - Blocks on fishery and trawl survey
 - Annual devs on pre-1989 longline and trawl fishery selectivity parameters
 - Longline survey single selectivity curve
 - Catchability on AFSC longline survey scaled to CFSR temperatures (at 10cm fish mean depth)
- No age data prior to 2007 due to aging bias

Models reviewed in 2019

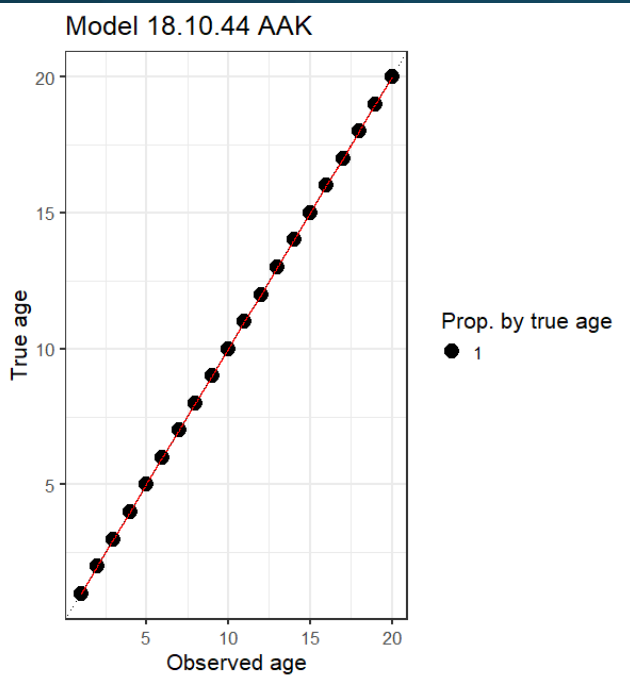

Model	Data	Plus group	Aging error	Aging bias
18.10.44	No age data pre-2007	20+	No	No
19.11.44	No age data pre-2007	10+	Yes	No
19.14.48c	All Cond. length at age	10+	Yes	Pre-2007 fit, 2007+ fixed at 0

Aging error and bias

- Model 19.11.44 adds aging error without bias for all age data
 - Aging error derived from age reader validation test for 2007-2017 survey data
- Model 19.14.48c adds aging error for all age data and aging bias for pre-2007 age data
 - Aging bias fit within the model

Model selection

- Direct comparisons of likelihood not possible as data and error structure change
- Adding aging error adjust weighting in model to fit survey estimates better and composition worse
- Visual inspection of fits to data show very little difference

Model 19.14.48c

Length composition fits

EM is impacting data availability

GOA Pacific cod Assessment Model Recruitment

- Low recruitment in 2014-2018
 - 2014 lowest recruitment estimate in time series at 0.2×10^9
 - 2014 and 2016 through 2018 decreased in relative strength compared to last year's base model
 - 2015 increased in relative strength compared to last year's model

GOA Pacific cod

Assessment Model Spawning Biomass

- Lowest female spawning biomass in 2019 (32,231 t)
- Peak female spawning biomass in 1990 (248,915 t)
- 2018 previous low at 37,369 t
- Dipped to a low of 61,215 in previous low period in 2008
- Build up in 2009-2013 based on large 2005-2008 year classes
- Peak in 2014 total biomass due to large 2011-2012 year classes

Total biomass by length

GOA Pacific cod Model 19.14.48c Fishing mortality

- Increasing trend in F over time until 2018
- Relatively high F 2016-2017
- Below $B_{20\%}$ for 2018-2020
- Projected to be above $B_{20\%}$ in 2021 under average conditions

GOA Pacific cod Assessment Model Projections

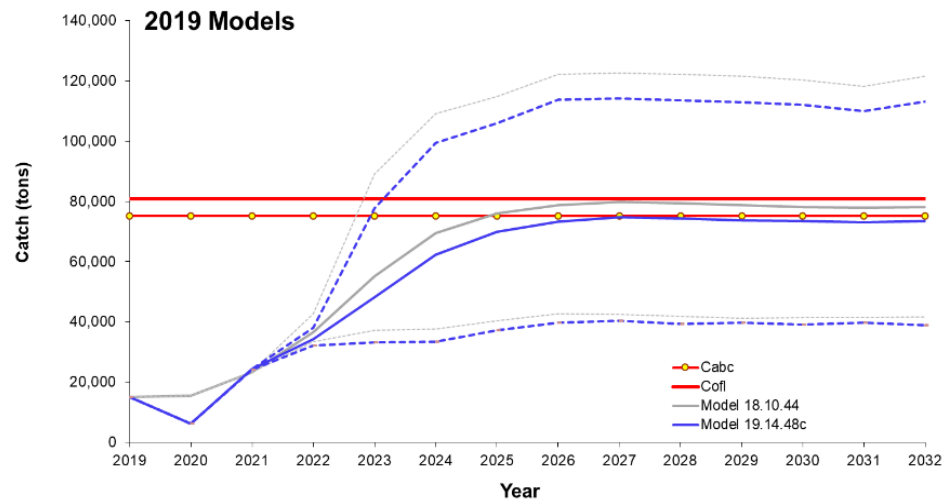

- Spawning biomass projected to reach all-time low in 2020
- Due to high mortality of the 2011 and 2012 age classes and expected poor recruitment 2014-2018
- First increase expected in 2019 given low fishing pressure
- Projection based on average recruitment after 2018

GOA Pacific cod Model 19.14.48c Projections

- Below $B_{20\%}$ in 2020
- Adjusted catch to 6,300 t in 2020
 - 3,300t state fishery and
 - 3,000 t as bycatch in other fisheries

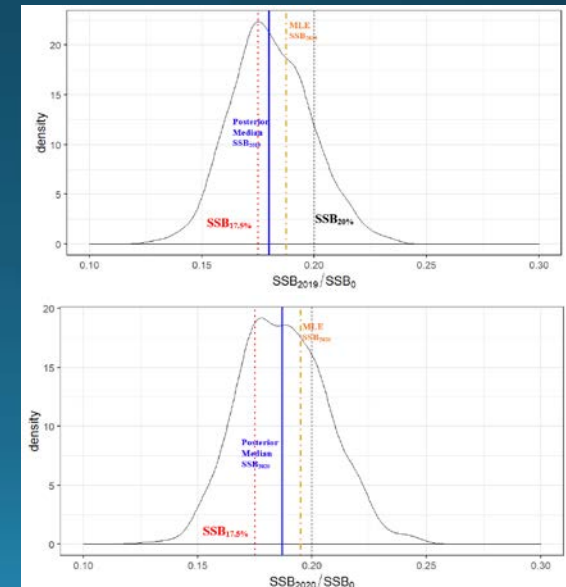

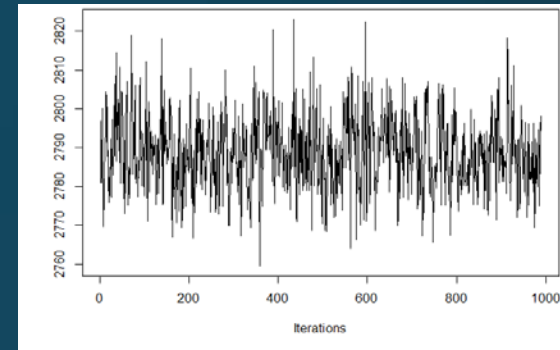

GOA Pacific cod Model 19.14.48c Projections

- Above $B_{17.5\%}$ in 2019 and 2020
- Above $B_{35\%}$ by 2029 and 2031
- Not overfished, not overfishing...

M19.14.48c- MCMC

- Well behaved posteriors
 - 1,000,000 iterations (150,000 burn in and thinned by 1,000)
- Results
 - 85.3% probability of being $\leq B_{20\%}$ in 2019
 - 39.8% probability of being $\leq B_{17.5\%}$ in 2019
 - 73.3% probability of being $\leq B_{20\%}$ in 2020
 - 27.7% probability of being $\leq B_{17.5\%}$ in 2020

GOA Pacific cod Dorn risk matrix

Assessment-related considerations	Population dynamics considerations	Environmental/ecosystem considerations	Fishery Performance	Overall score (highest of the individual scores)
Level 2: Substantially increased	Level 2: Substantially increased	Level 2: Substantially increased	Level 1: Normal	Level 2: Substantially increased

Assessment - Level 2:

- Modeling uncertainty in the early recruitment estimates and model sensitivity relative to other North Pacific assessments where this is not an issue.

Population dynamics – Level 2:

- With average recruitment it is expected that the stock status will improve, however there are indications that 2019 recruitment is well below average.

Environment – Level 2:

- Conditions in 2017 and early 2018 appeared to have improved
 - Currently experiencing heatwave (10 Sept 2018 – present)
- Fishery Performance – Level 1:
 - Mixed signals

GOA Pacific cod

Status

Authors' recommended Model 19.14.48c

- $B_{2020} = B_{17.6\%}$
- $B_{2021} = B_{22.4\%}$

- Below $B_{20\%}$ requires shutting down of directed fisheries for SSL concerns in 2020

- MaxABC recommendation at 14,621 t for 2020
- MaxABC recommendation at 24,820 for 2021

- All projections here assume 6,300t of catch in 2020
 - (3,300 t state fishery and 3,000 t bycatch in other fisheries)

- Area apportionment based on random effects model
