

NPRB #23-08

Bristol Bay Settlement Project

Crab Plan Team, Seattle WA

September 12, 2024

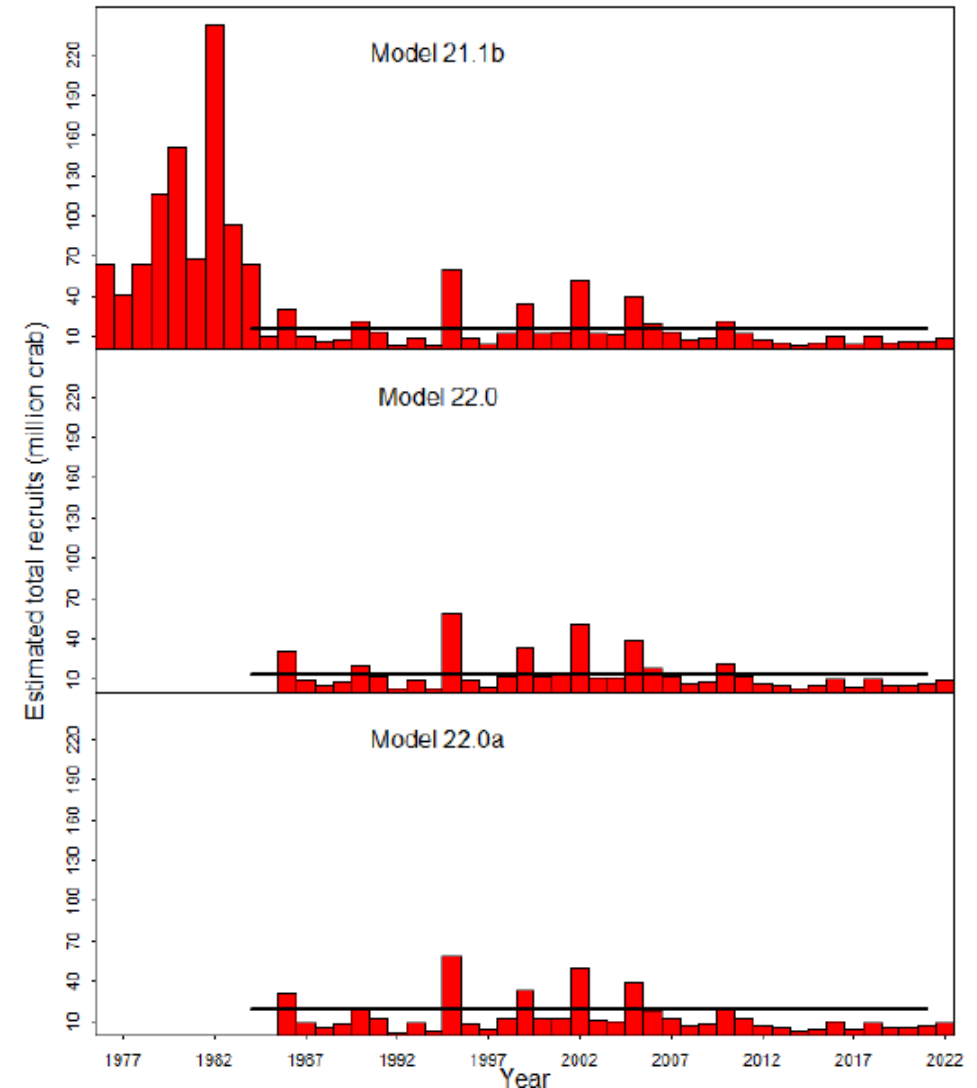

PI's: Jared Weems, Scott Goodman, Chris Long,
Ben Daly, Katie Palof, Tim Loher, and Gordon
Kruse

Participating Scientists: Liza Hasan, Erin Stand,
Marina Thomas, Ric Shepard

Assessment of Bristol Bay Red King Crab Recruitment Bottlenecks

- Framing the issue
 - Decade-plus long, continuous decline in BBRKC abundances
 - Low, intermittent recruitment pulses for last three decades and historically low over the last 12 years
 - Apparent contraction of the population to central Bristol Bay (northward)
 - Loss of biomass on the Slime Bank
 - Increases in northern district crab?
- Can early life assessments help inform recruitment?
- What are the appropriate methods?

Assessment of Bristol Bay Red King Crab Recruitment Bottlenecks

- Possible limiting factors, and things to think about

- Supply of juveniles
 - Supply and development of development of larvae and settlers
 - Female spawners abundance and distribution at time a larval release

- Habitat
 - Availability / change over time
 - Disturbance effects on RKC recruits

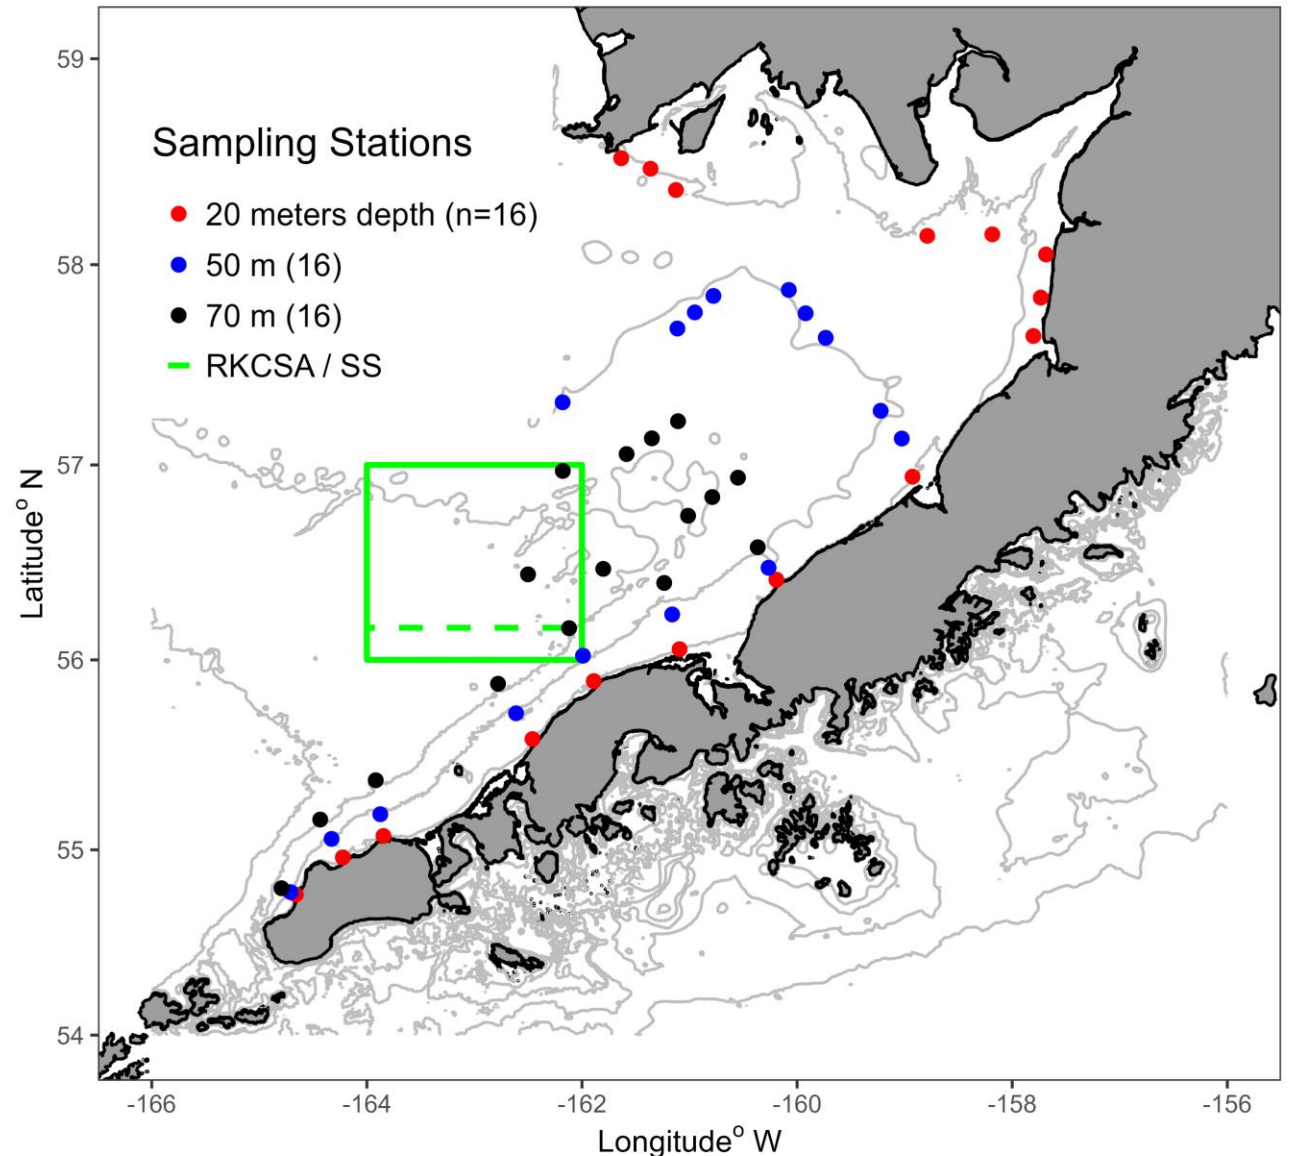

- Predation
 - Pelagic (e.g., BB sockeye salmon)
 - Benthic (e.g., Pollock, Pcod, flatfishes, and reef fishes)
- Climate
 - Retrospective analyses or modeling with data in hand
 - Field assessment and laboratory research relative to crab condition
- Management and Policy
 - Area closures, fisheries restrictions / closures, biological thresholds, enhancement

Assessment of Bristol Bay Red King Crab Recruitment Bottlenecks

Objectives

- Collect quantitative data on
 - Settlement habitat
 - CamSled benthic image analysis
 - Post-larval red king crab supply
 - Artificial collectors catch
- Collect supporting crab and ecosystem-level data
 - Oceanography
 - Ocean acidification
 - Pelagic larval crab community
 - Sediment grain size
 - Benthic infaunal communities
 - Crab movement (tagging)

Sampling Plan

- Charter 1 (35 days)
 - BSFRF charter of FV Early Dawn
 - DFG coop-agreement
 - Extensive pre-cruise fabrication period
 - 17 sampling days
 - May 3-22
- Charter 2 (14 days)
 - DFG charter of PV Stimson
 - Simple, cost effective SOA-RSA process
 - 8 sampling days
 - August 17-24

ADF&G CamSled

- Scallop program developed by Gregg Rosenkranz in early 2000s
 - Network developed by Ric Shepard
 - WHOI / Habcam partnerships
- 2008 Bering Sea tests in Norton Sound, St. Mats, and St. Paul
- 2015-2022 no deployments
- 2023 re-boot

Alaska CamSled
High Resolution Benthic Imaging

ALASKA
DEPARTMENT OF FISH AND GAME

Over 2,800 km imaging transects towed in the Gulf of Alaska and Bering Sea

System Features

- 1600 x 1200 pixel GigE Vision™ camera
- 6 xenon flashlamp strobes
- Gigabit Ethernet data telemetry
- armored fiber optic tow cable
- real-time onboard image and sensor display
- 1 m-wide seafloor FOV
- 5 images/sec, 40+ gigabytes/hr
- towing speeds 4+ knots

Over 7 million images collected and archived at ADF&G-Kodiak

Benthos off Narrow Cape, Kodiak Island, Alaska

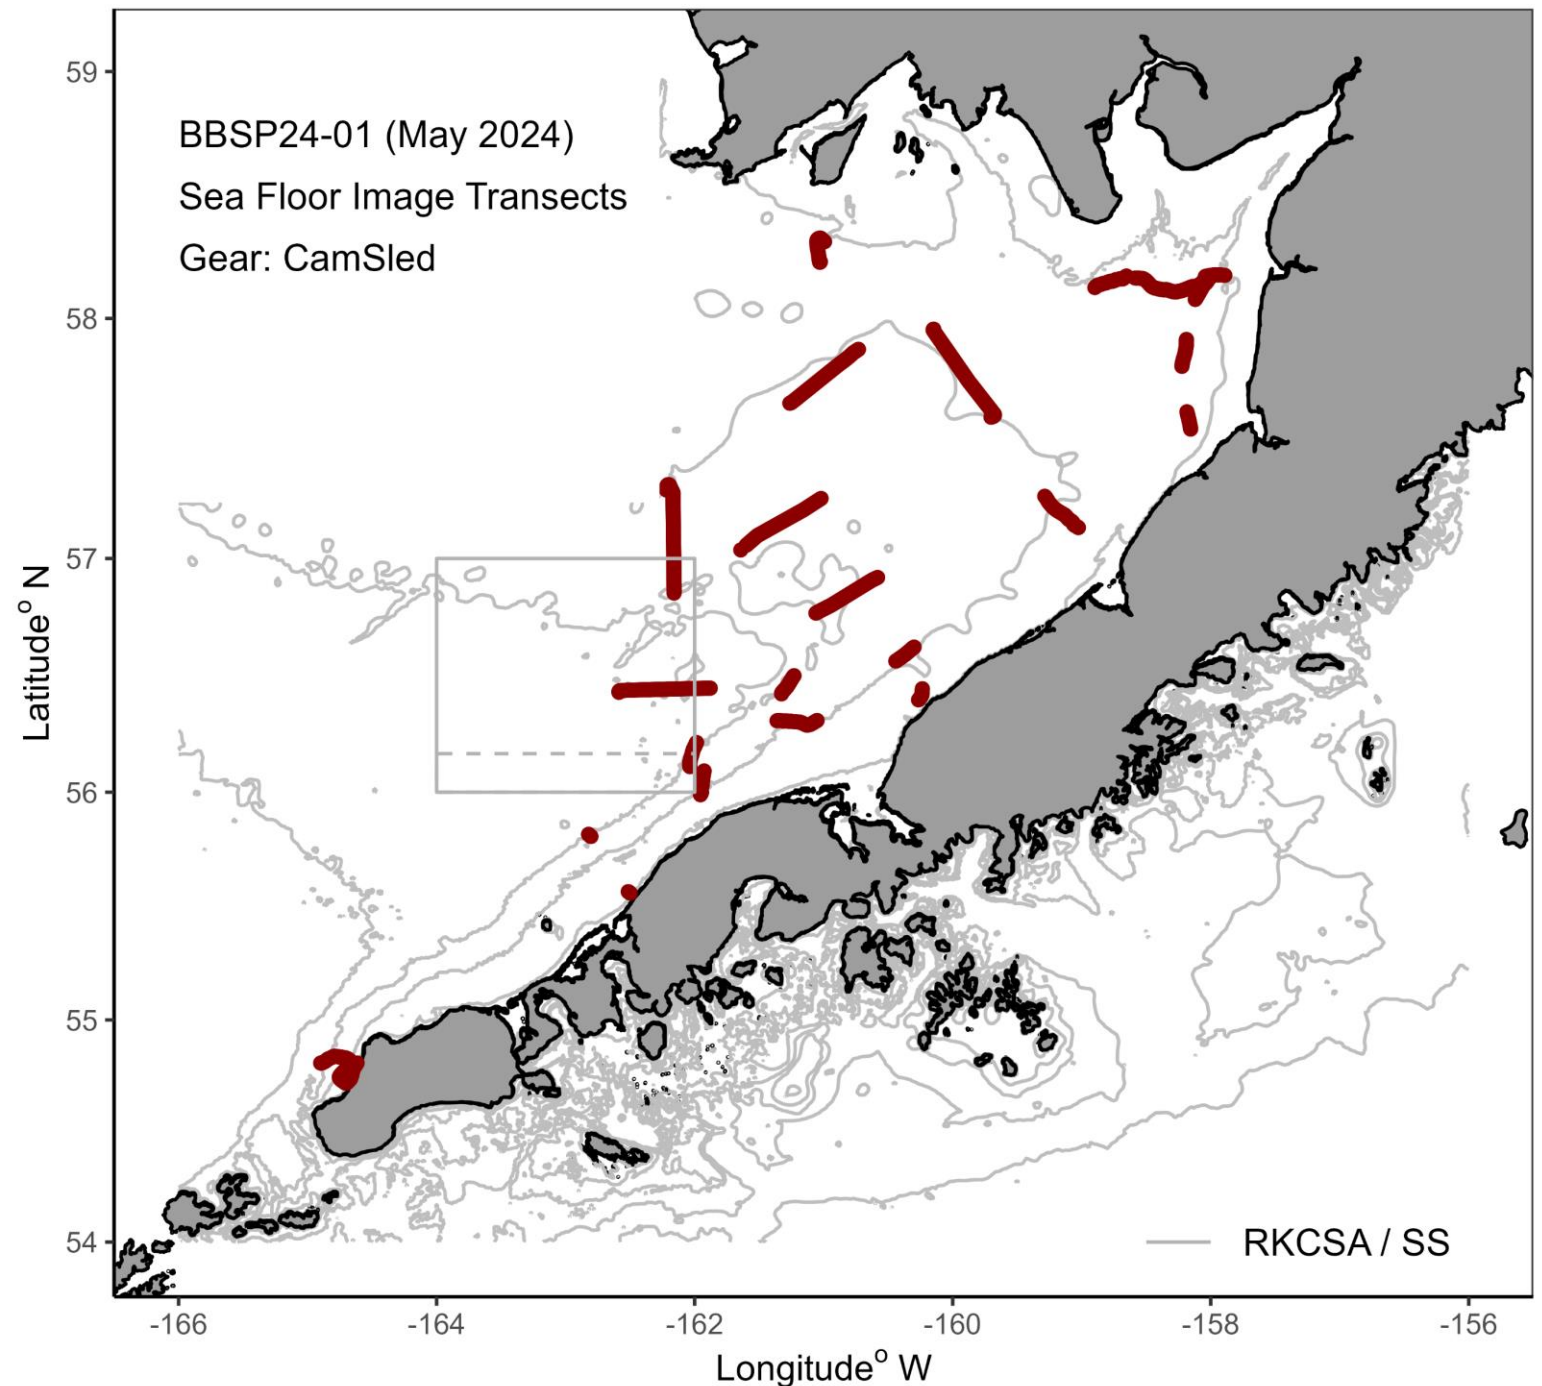

CamSled 2024

- Over 500 km towed
- 34 of 48 planned stations
- Optimal sled performance, some human error
- Water clarity can be an issue
 - 30-80 m depth relatively clear water
 - < 30 m weather and turbidity issues
- Image annotation starting soon!

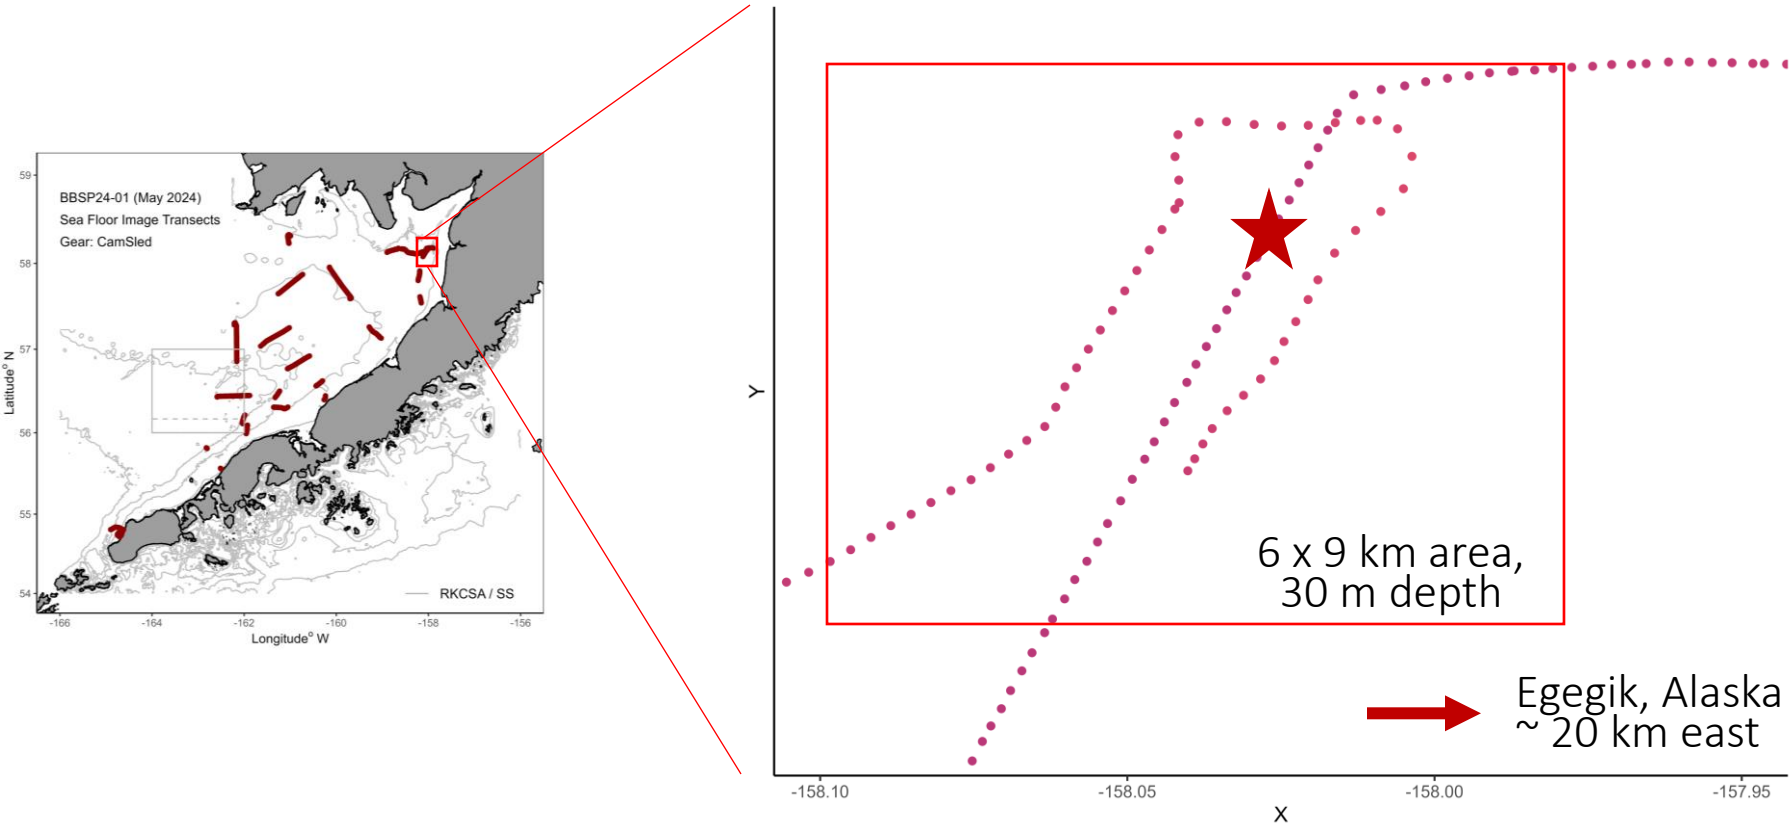

First direct scientific evidence of juvenile podding behavior in Bristol Bay red king crab!

4-5 m² = 200+ crab

First direct scientific evidence of juvenile podding behavior in Bristol Bay red king crab!

Shallow gravel, deep vertical epifauna

Central BB Mating Pairs

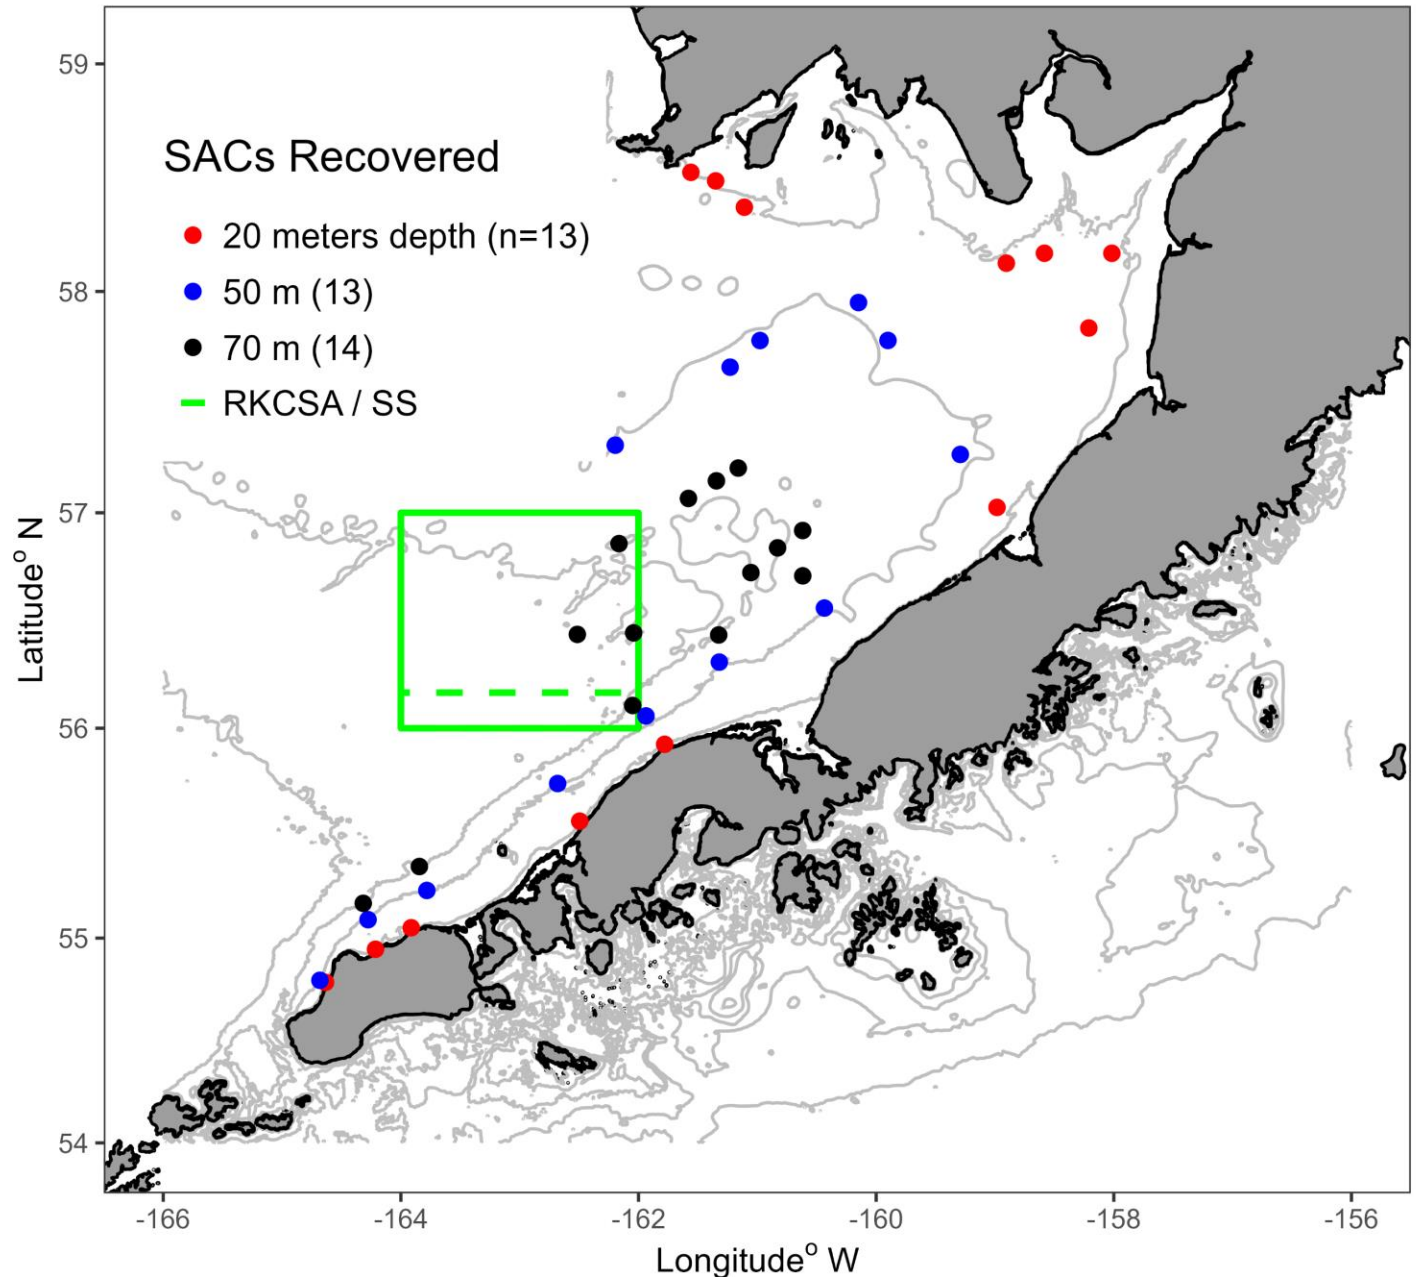

Lots of pollock and flatfish

Artificial Collectors

- Crab pot moorings
 - 48 deployed
 - 40 recovered
- Artificial collectors
 - 4 per station
 - 10 mm mesh (3)
 - 5 mm mesh (1)
 - 160 recovered
- Fishery conflict avoidance and satellite monitoring with 'smart' buoys
- Image annotation starting soon!

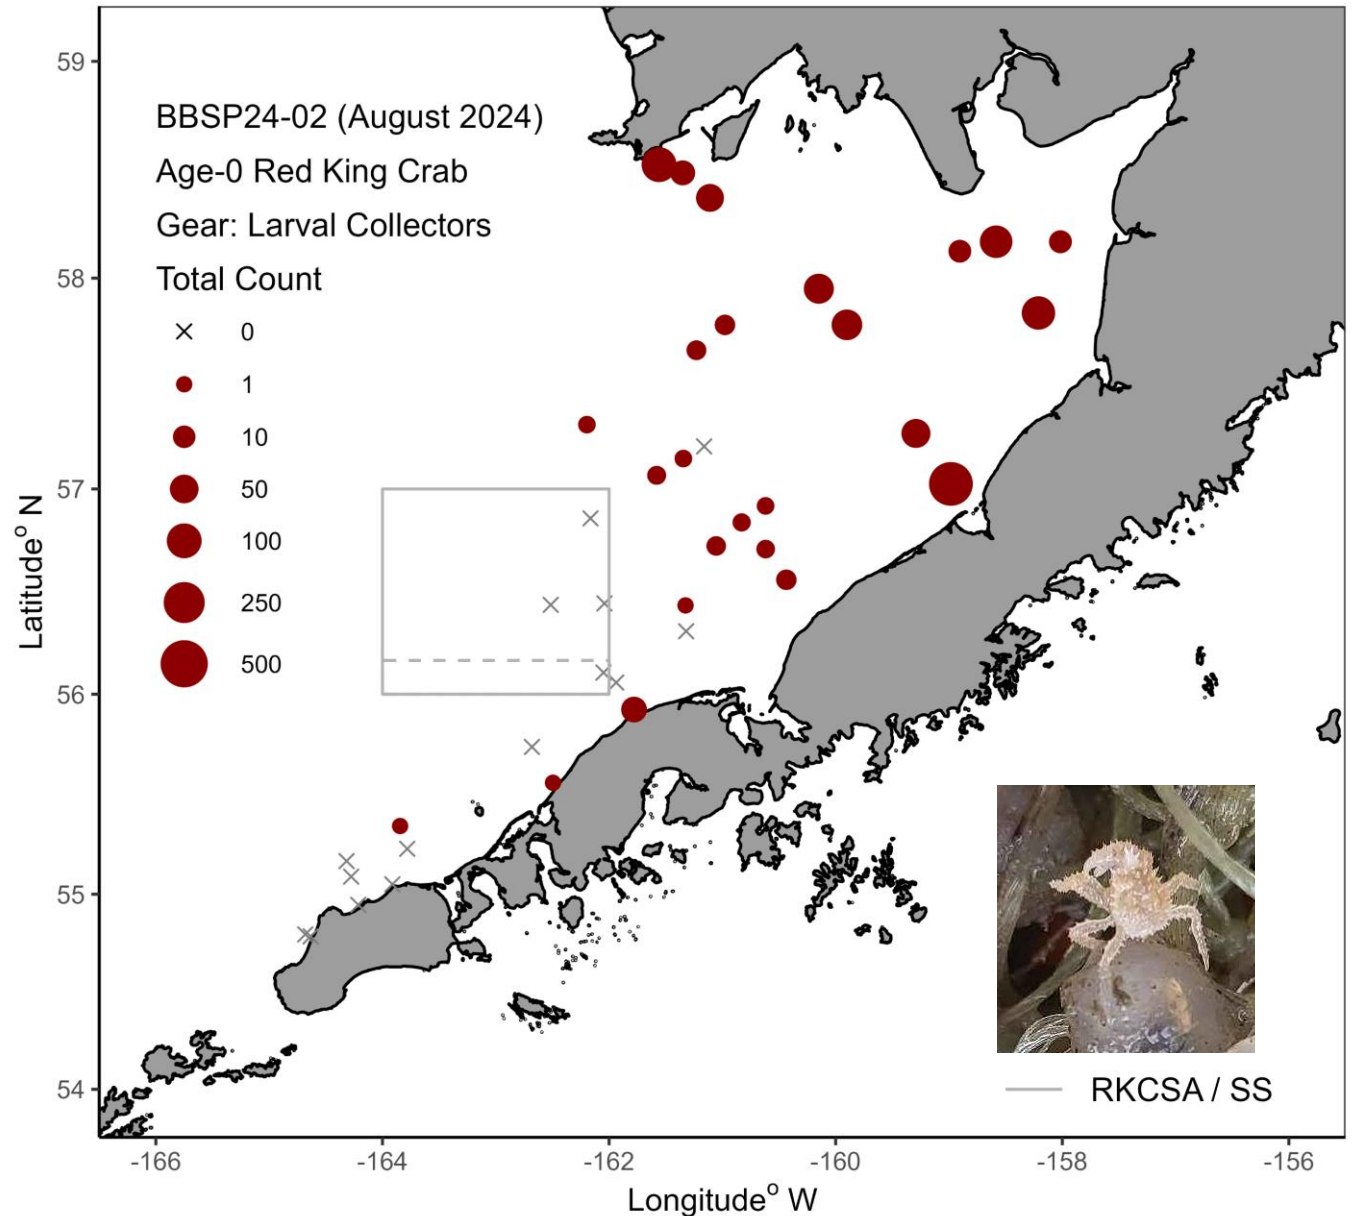

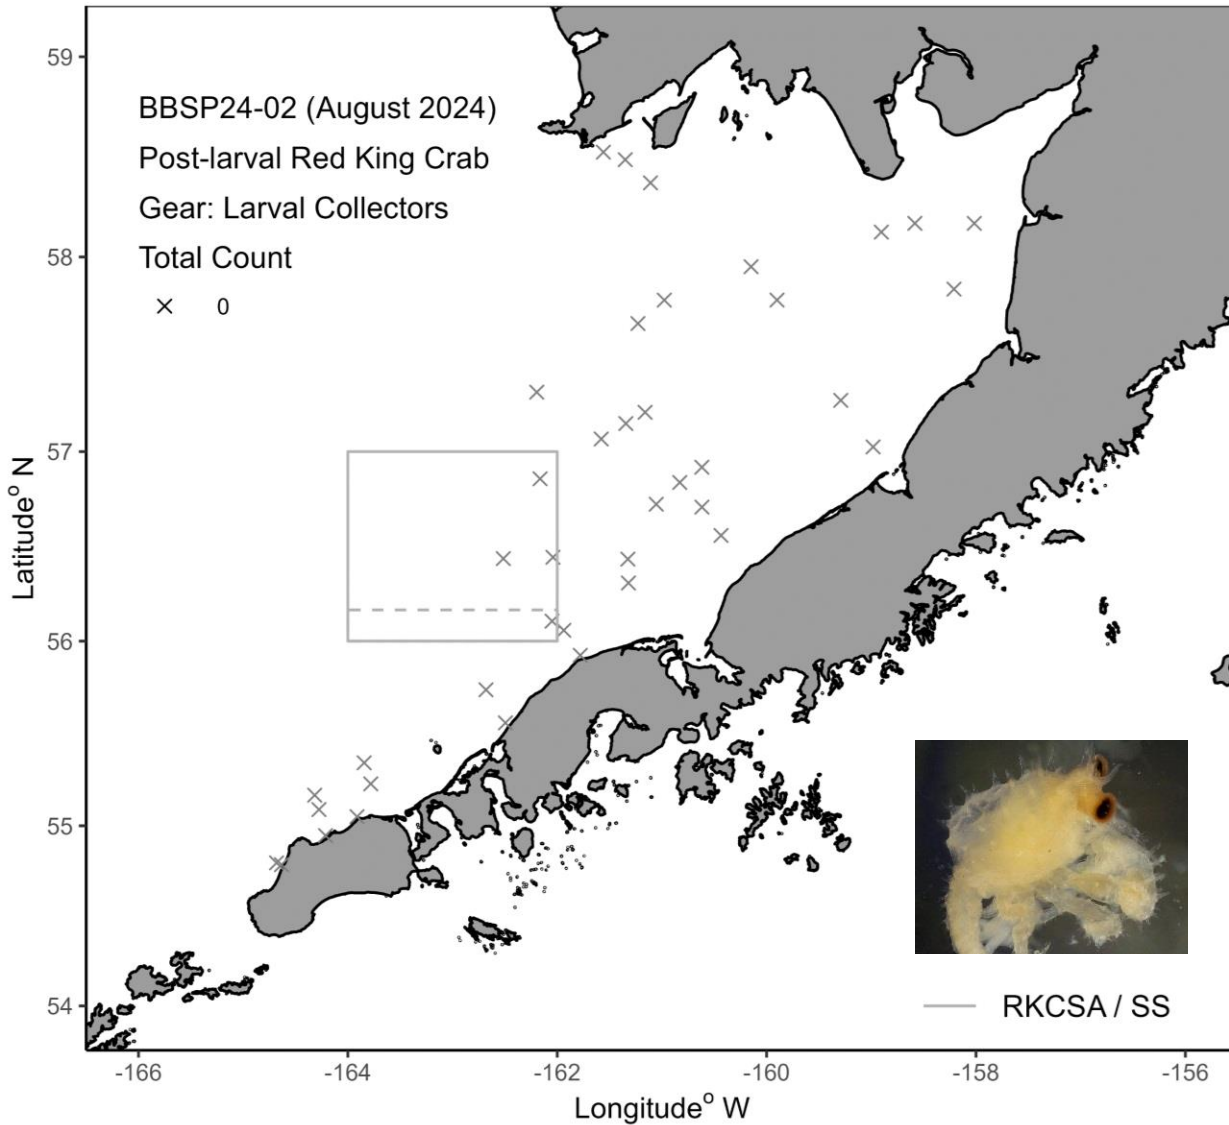

Age-0 RKC Catch

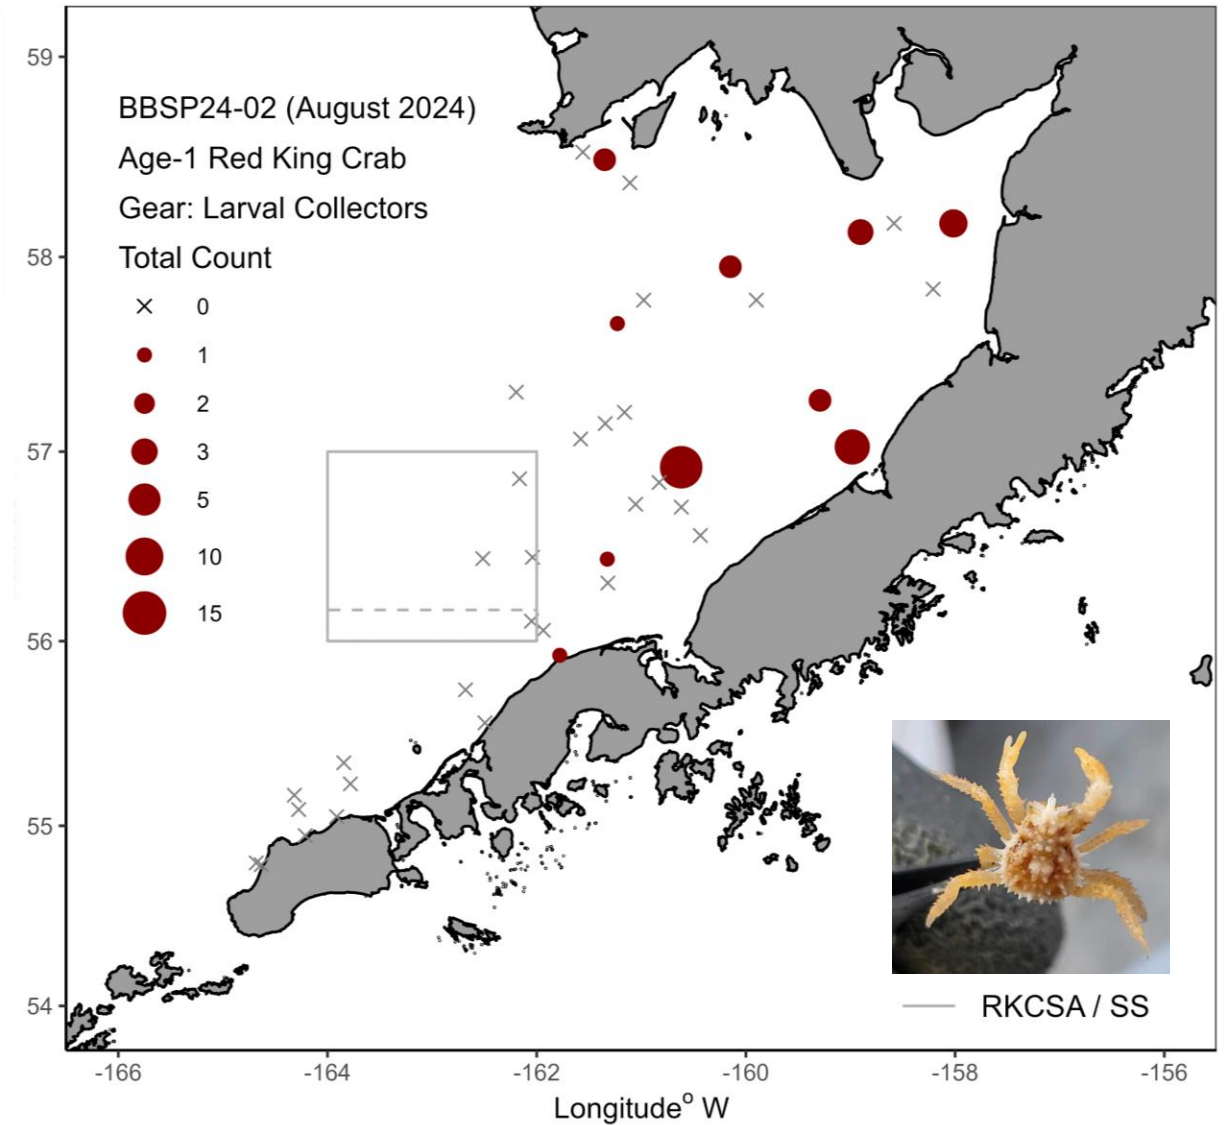

- 1,558 individuals
 - 94 % of total catch found in the upper Bristol Bay region
 - 20-50 m stations
 - Port Heiden hot spot
 - > 100 ind. per collector
 - Could have had more?..
 - lost 3 nearshore samples
 - None observed in RKCSA
 - Only two observed south of the Black Hills
 - Other lithodids were observed

Glaucothoe Catch (0)

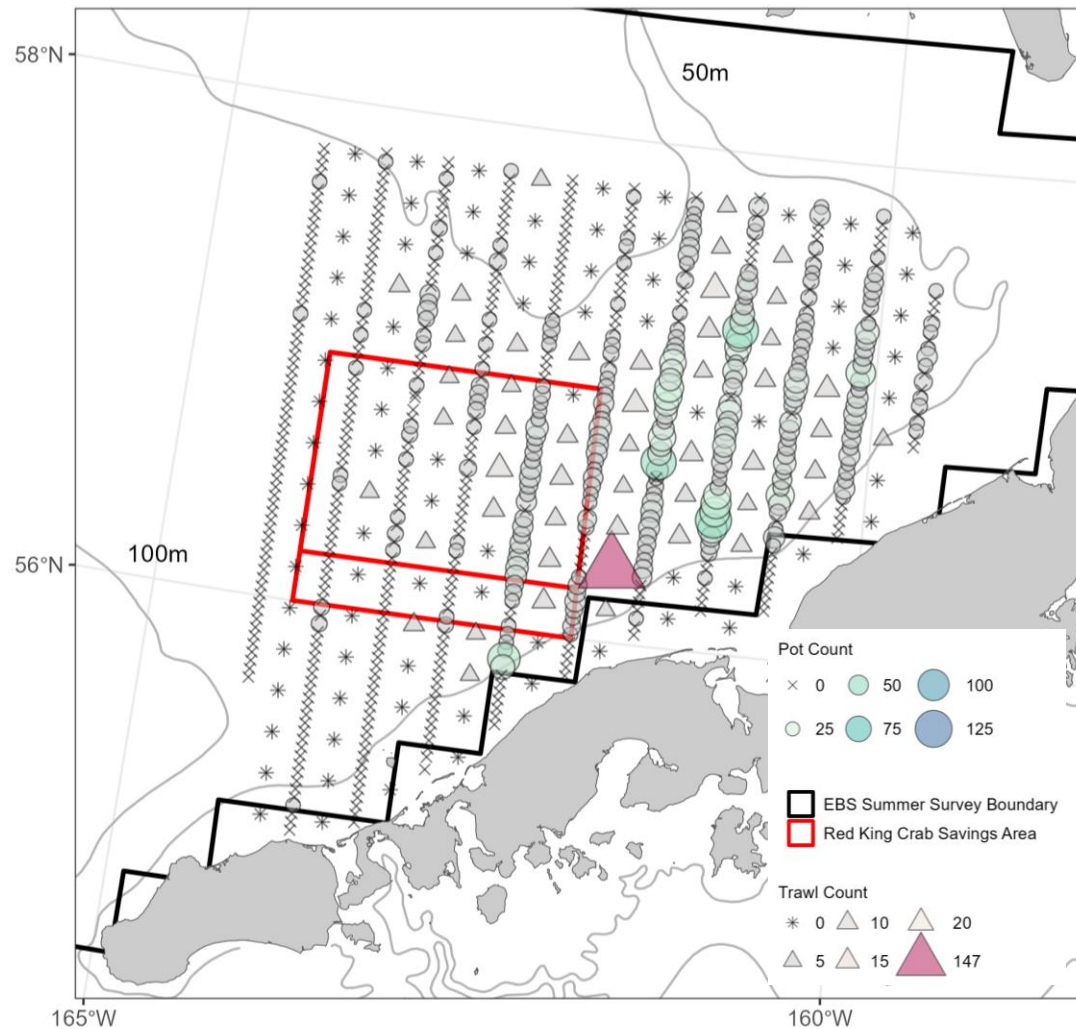

Age-1 Catch (38)

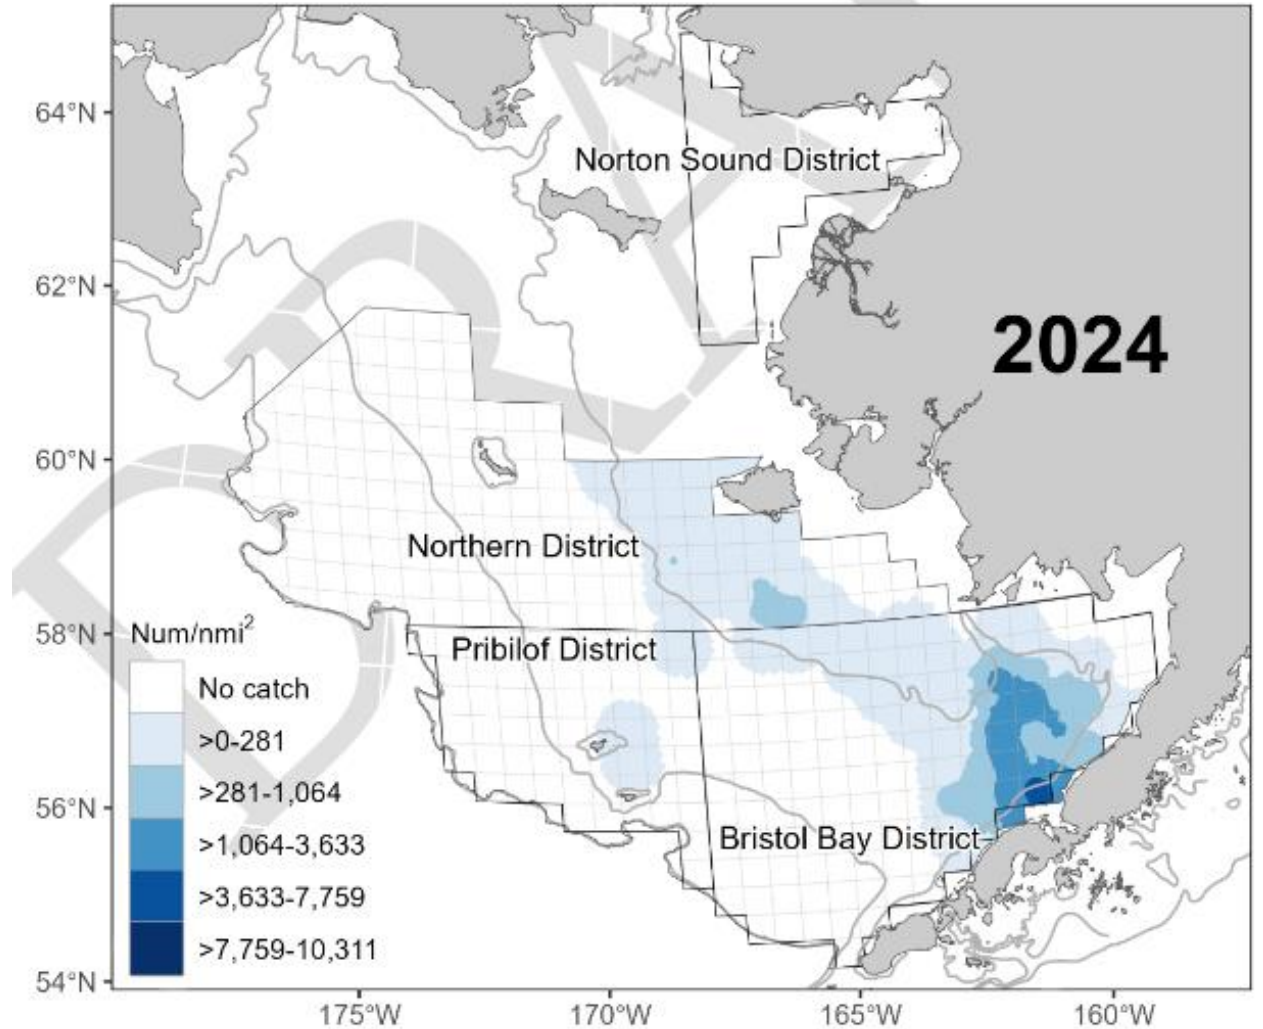

Mature Female Comparisons

- CPS2 (March)

- EBS (June)

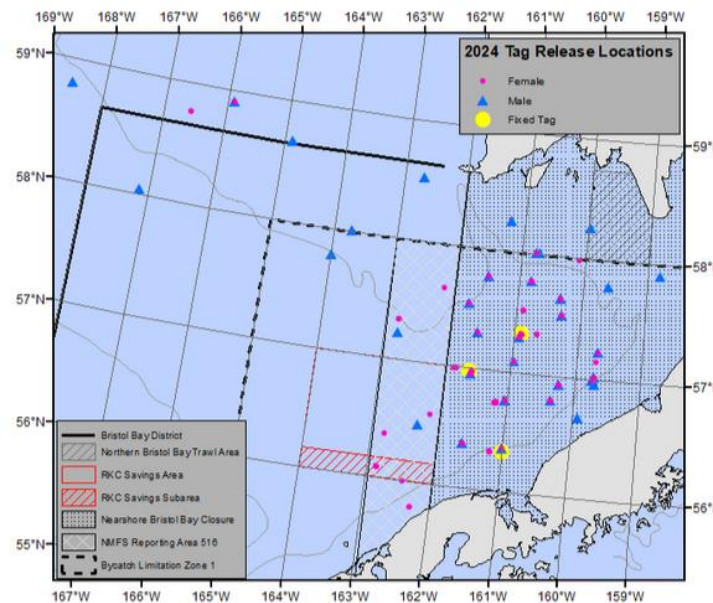

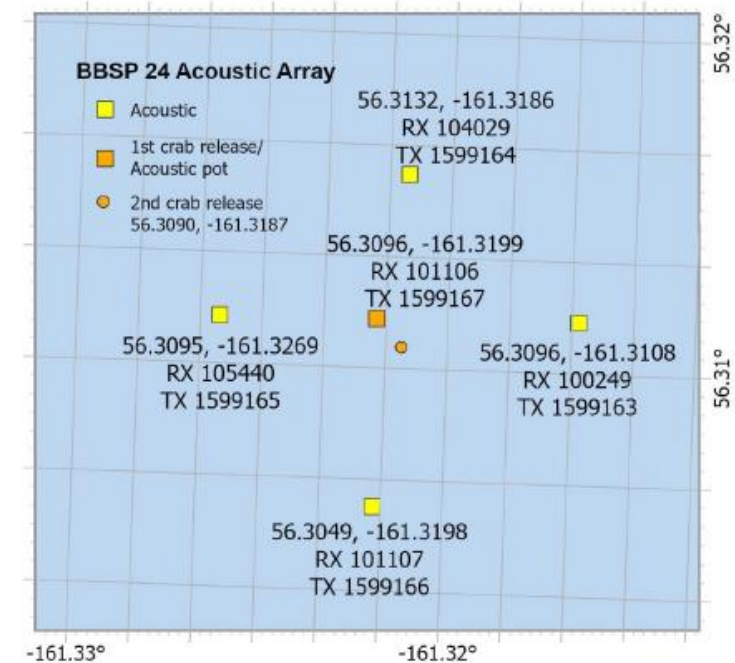

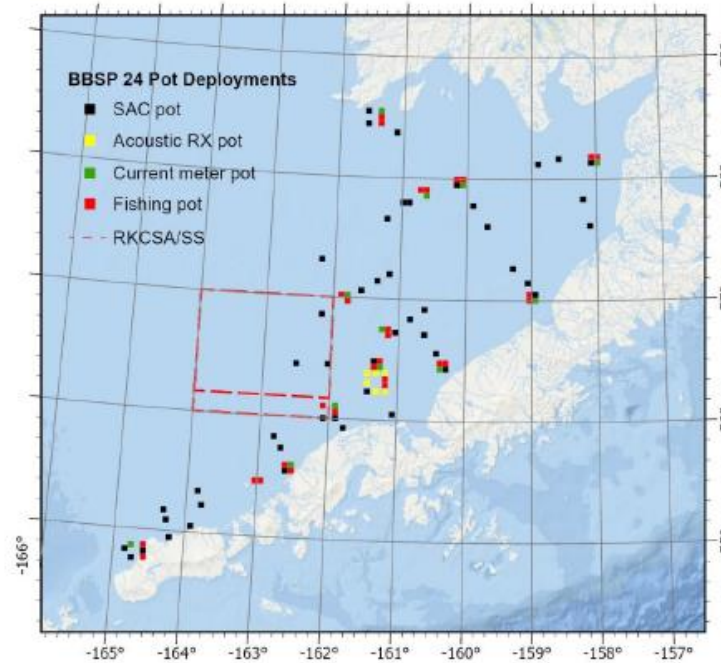

Surface Currents

- ‘Unfortunately’ smart buoys periodically broke off crab pot lines.
 - Very stressful, but interesting
 - Soliciting help in beached buoy recovery!
 - <https://bluevue.boggroup.net/#/login>
 - Username: bbsp_rkc
 - Password: redkingcrab1
- Possible re-analysis of Daly et al. 2020 ROMS-IBM w/ 2024 data?..

Crab Movement

- Two studies
 - Limited use of small-mesh pots
 - Leah's NPRB#24-09
 - Satellite popup tags deployed on mature females (n = 47)
- DFG internal funds for acoustic tracking of juvenile red king crab
 - 'Predator Tags' deployed on
 - UAF Glider and fixed receivers

Acoustic Tagging, V-Fin, and Shackleton Glider

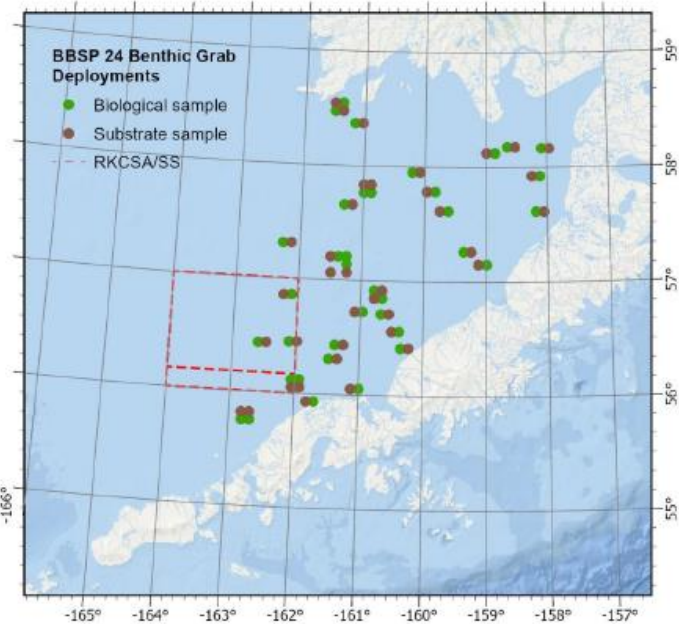

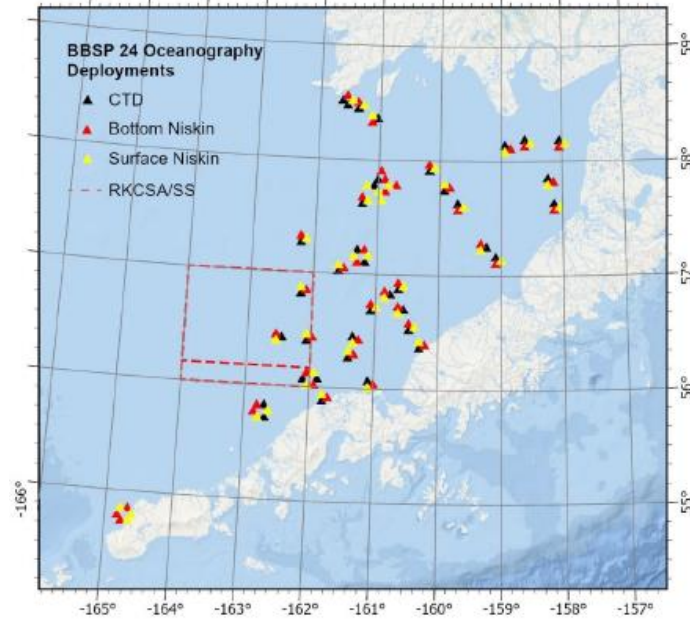

Preliminary conclusions

- First dedicated assessment of Bristol Bay red king crab recruitment at early life stages since the 1980s
 - Exceeded age-0 catch expectations in larval collectors
 - Appears to be spatial (and temporal) pattern to larval delivery
 - Development of recruitment index is possible
- First quantitative habitat assessment in Bristol Bay
 - Met nearly all CamSled field sampling objectives
 - Complex habitats nearshore (more abiotic) and offshore (large inverts)
 - Need more shallow, nearshore survey work... with favorable weather
- Ecosystem sampling was complimentary and effective

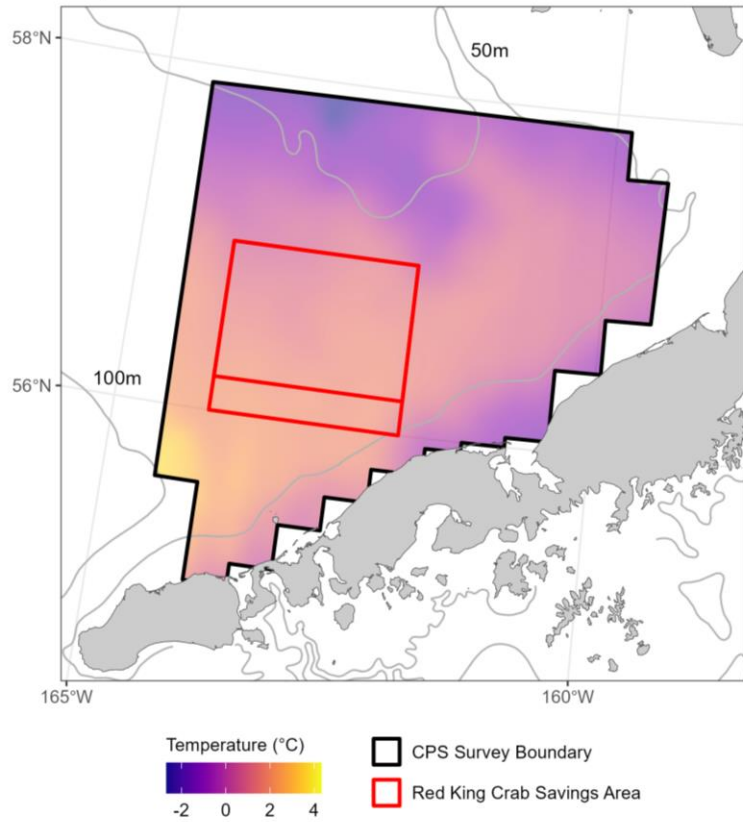

Ecosystem Sampling

- Oceanography (T/S)
- Ocean Acidification
- Larval crab community
- Sediment grain size
- Benthos communities
- Crab movement (tagging)

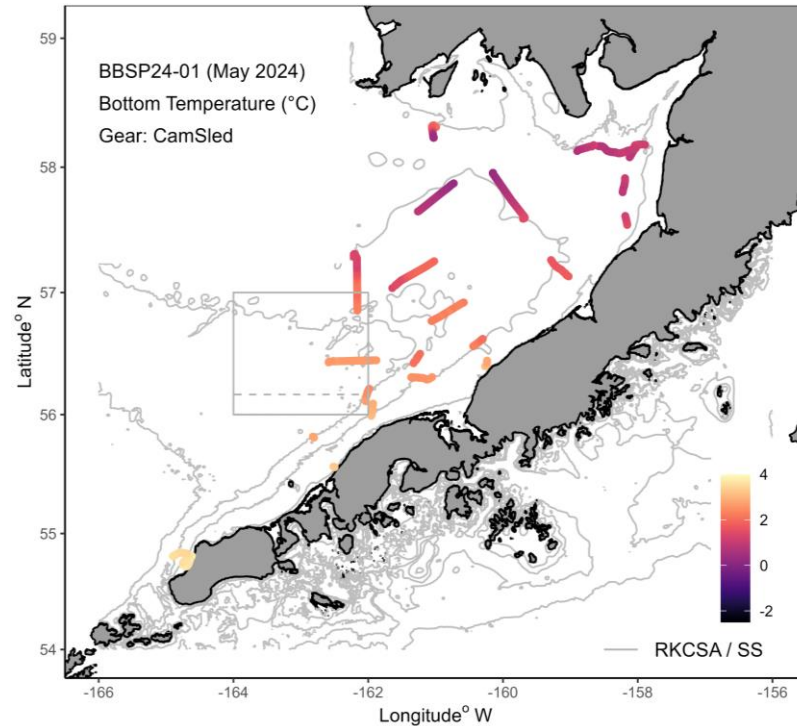

Ocean Temperature

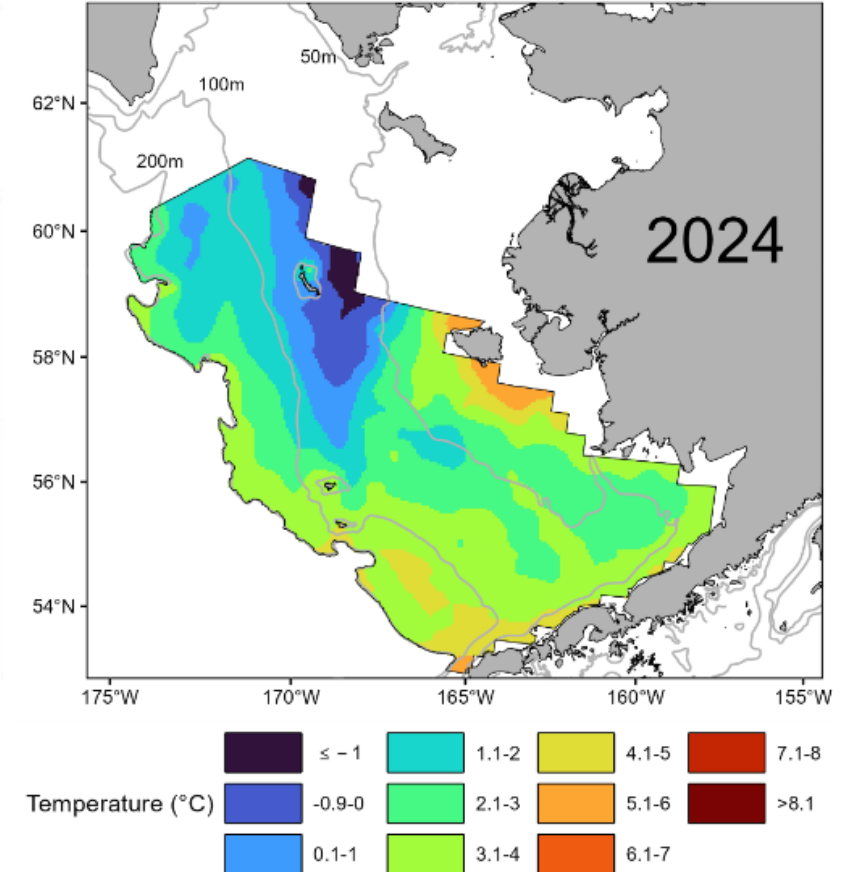

- CPS2 (March)

- BBSP (May)

- EBS (June)

Seasonal Temperature

- May – August continuous monitoring
 - Surface water – Satellite communicating 'smart' buoys
 - Bottom water – Tidbit loggers
