

**NOAA  
FISHERIES**

# 2024 BSAI Pacific ocean perch Assessment

**Paul Spencer and Jim Ianelli**

**Alaska Fisheries Science Center**

# Overall summary

- Minor tweaks to methodology (increased penalty for fishery selectivity, and prior on AI survey catchability)
- New procedures for model evaluation
- 2024 survey biomass is slightly lower than 2022 estimate, but recent have been large.
- 2025 ABC of 37,375 t (9% decrease from 2024 ABC).
- Assessment-related concerns noted in risk table.

# BSAI POP Outline

- 1) SSC, Plan Team comments
- 2) Catch information
- 3) Survey and fishery data
- 4) Model description and evaluation
- 5) Model fits to data
- 6) Risk table
- 7) Management recommendations

# SSC and Plan Team comments

(BSAI Plan Team, September 2022) *Of these CIE recommendations, the author recommended the following changes to be brought forward in November 1) fitting the model to survey abundance instead of biomass, 2) exploring stochastic initial age compositions, and 3) for equilibrium initial age composition, explore mortality rates other than that currently used in the model.*

Addressed in September report to the PT, which is included as an Appendix. Alternative methods for modeling the initial number at age did not improve the fits to the survey biomass index or the composition data.

# SSC and Plan Team comments

- (BSAI Plan Team, November 2022). *The Team discussed investigating the mortality rates by age particularly for the plus group as there were poor fits to this group in the eastern Bering Sea (EBS) slope survey. The Team noted that time blocks could be explored for the plus group or consider time-varying selectivity as there were younger fish in the AI BTS than the EBS slope survey.*
- (SSC, December 2022). *The SSC concurs with the BSAI GPT suggestion to pursue time-varying survey selectivity for the AI bottom trawl survey and supports the BSAI GPT's other suggestions for model improvements*

Also addressed in the September report to the PT. Dome-shape survey selectivity was not supported by the data, and a model with time-varying survey selectivity showed little variation in survey selectivity between years.

# SSC and Plan Team comments

- (BSAI Plan Team, November 2022). *The Team also discussed the relative proportion of the EBS slope survey information into the future and encouraged the author to look at alternatives for estimating the apportionment on the EBS slope and comparing where the different surveys match up in the past for determining what the proportion should be moving forward.*

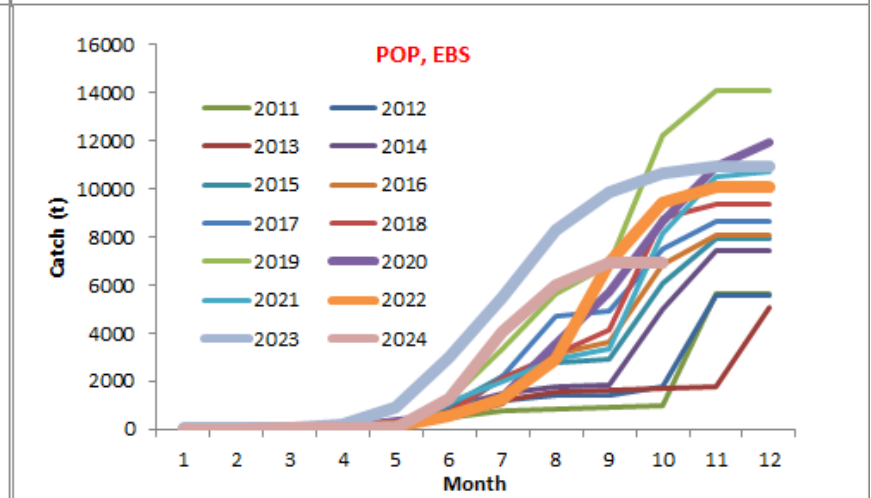

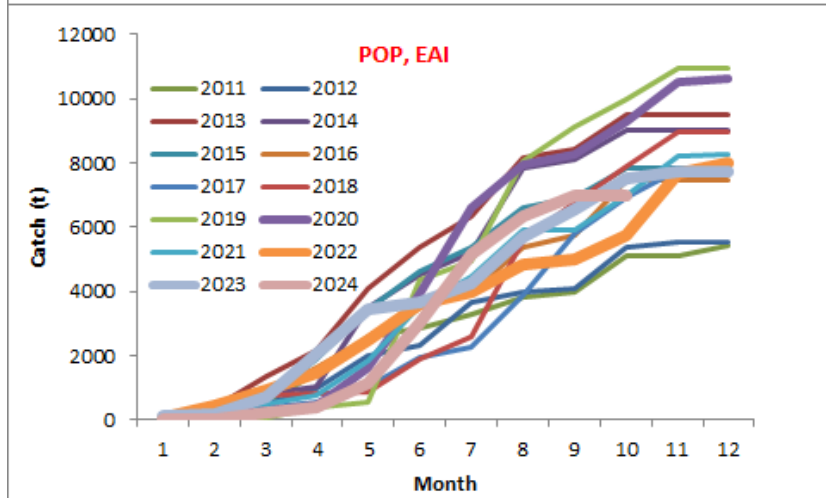

EBS slope survey has not been conducted since 2016, which impedes a data-based solution to this issue.

# BSAI catch peaked in 2019, declined last few years (2024 through October 25)

# BSAI POP catch by month and area, 2011-2024

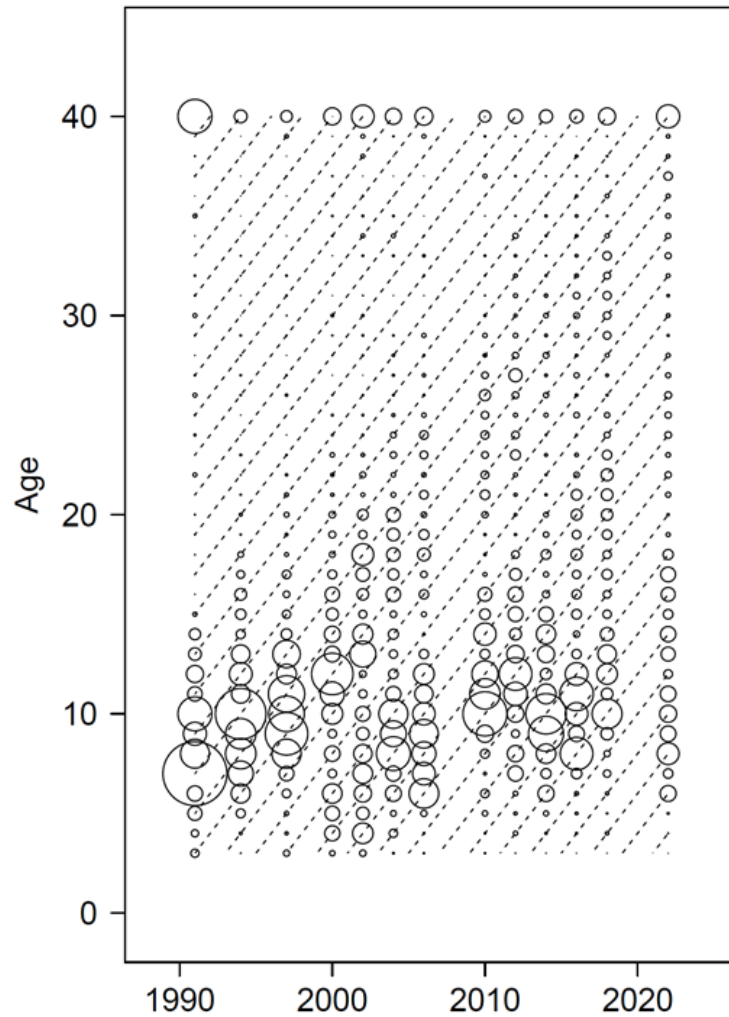

# Data in assessment model

Component	BSAI
Fishery catch	1960- <b>2024</b>
Fishery age composition	1981-82, 1990, 1998, 2000-2009, 2011, 2013, 2015, 2017, 2019, 2020, 2021, <b>2023</b>
Fishery size composition	1964-72, 1983-1984, 1987-1989, 1991-1997, 1999, 2010, 2012, 2014, 2016, 2018, <b>2022</b>

# Survey CPUE, 2018 – 2024 AI surveys

2018 AI Survey POP CPUE (scaled wgt/km<sup>2</sup>)

2022 AI Survey POP CPUE (scaled wgt/km<sup>2</sup>)

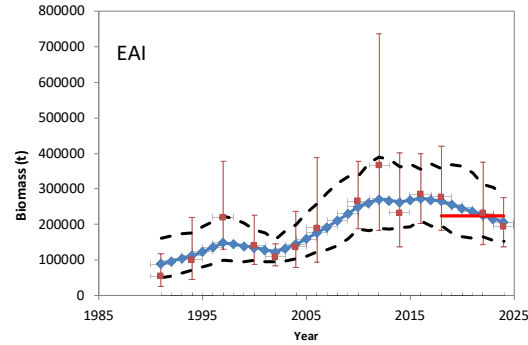

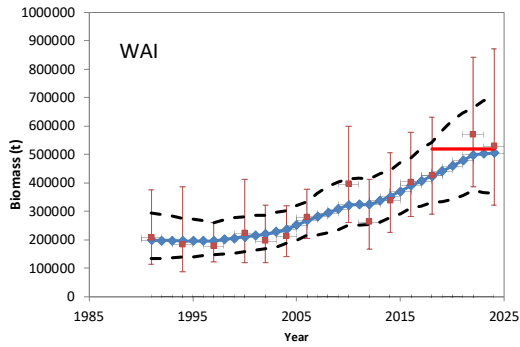

2024 AI Survey POP CPUE (scaled wgt/km<sup>2</sup>)

Year	Western	Central	Eastern	southern BS	Total AI survey
2018	427,440 (0.20)	195,497 (0.19)	278,326 (0.21)	115,046 (0.29)	1,016,309 (0.11)
2022	570,272 (0.20)	153,147 (0.23)	232,021 (0.25)	113,738 (0.37)	1,063,030 (0.13)
2024	529,334 (0.26)	191,364 (0.24)	193,387 (0.18)	69,550 (0.62)	983,636 (0.16)

# Smoothed survey time series by subarea

# Model description

Model	Differences from 2022 model
Model 16.3 (2024)	No modeling differences. Freely estimates the AI and EBS survey catchability coefficients without prior distributions
Model 24	Model 16.3, but with the penalty for the dome-shapedness in the bicubic spline used for fishery selectivity increased from 10 to 30, and a lognormal prior on the AI survey catchability (mean=1, CV=0.15)

# Fit to the AI survey

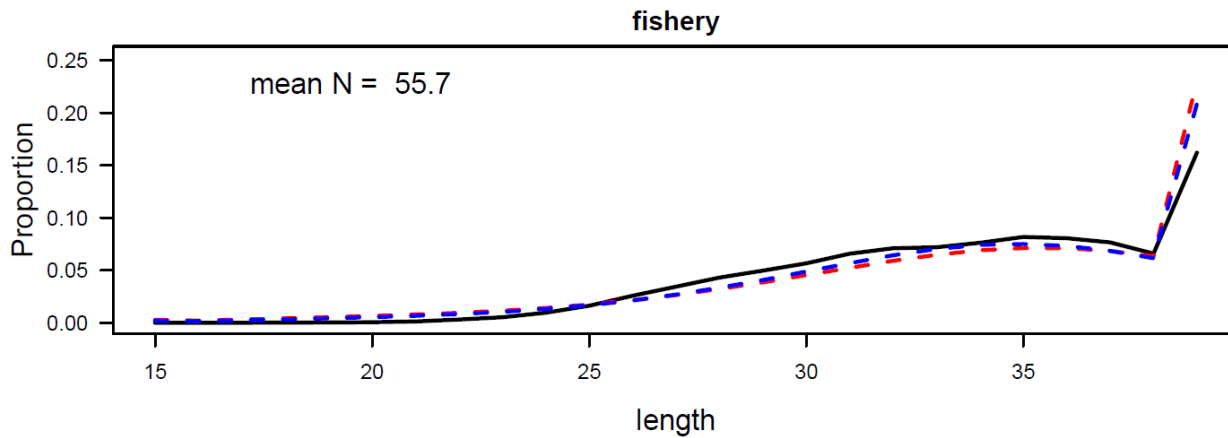

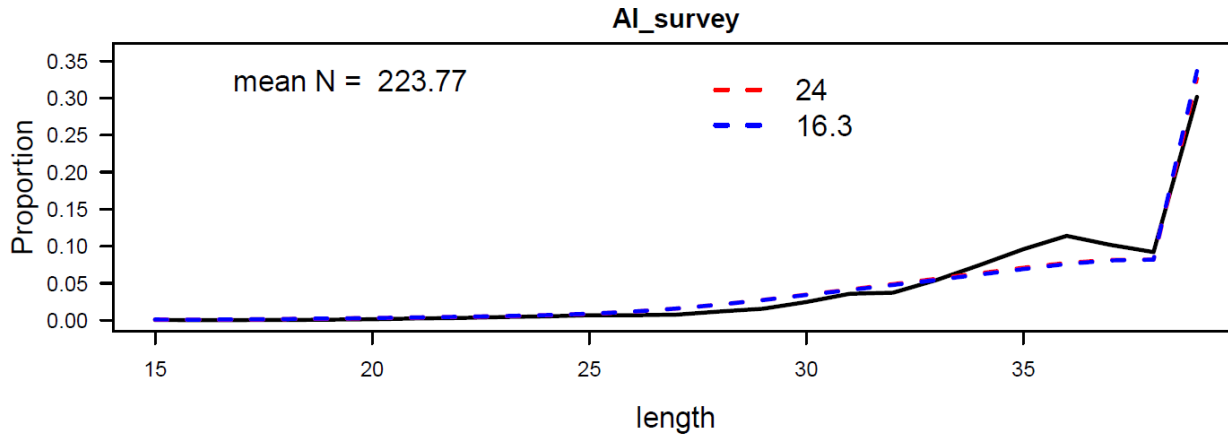

# Aggregate fits to age comps, two models

# Aggregate fits to length comps, two models

# Estimated total biomass, two models

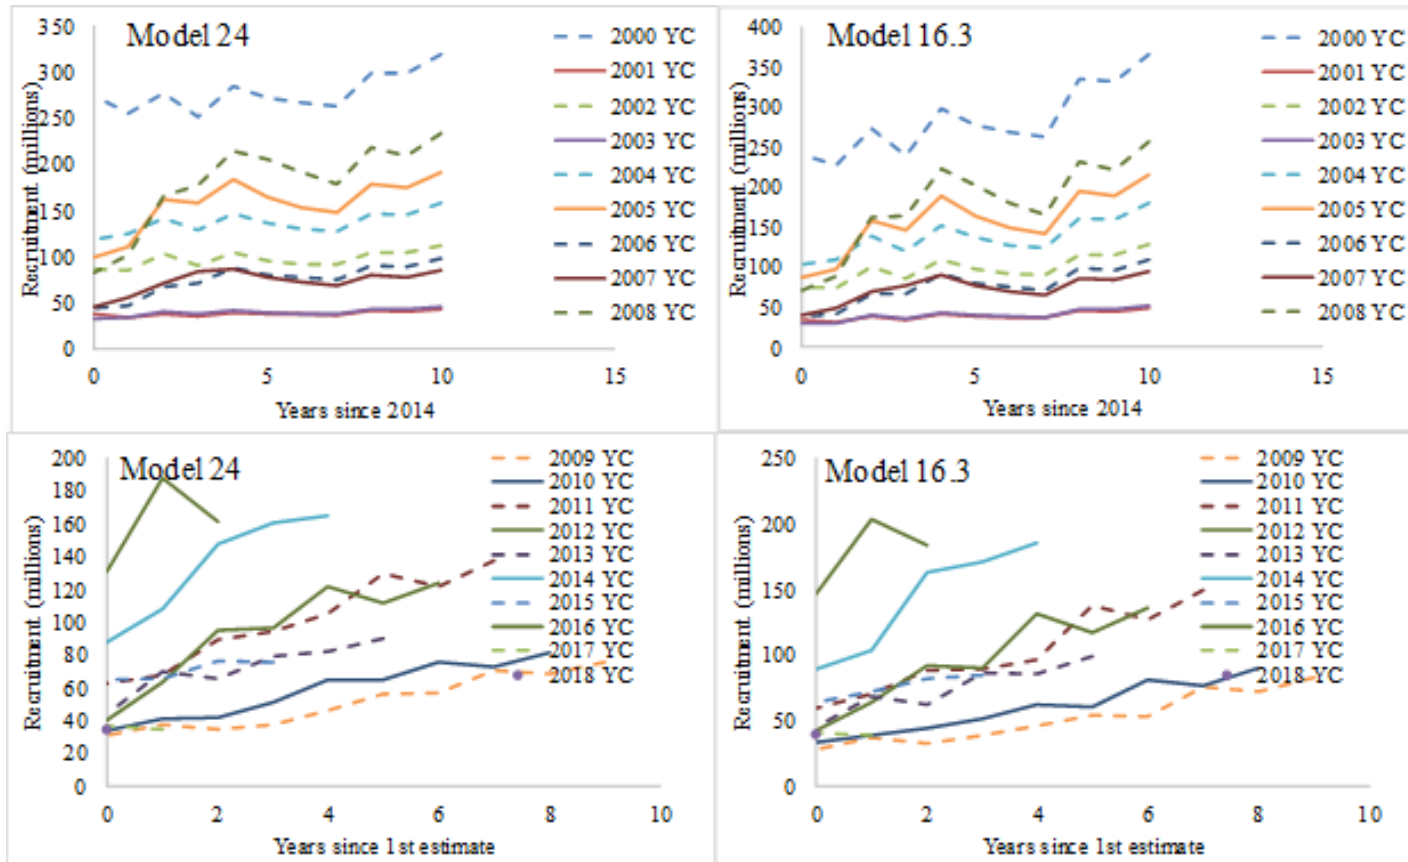

# Likelihood table

	Model 16.3 (2024)	Model 24
<b>Negative log-likelihood</b>		
<i>Data components</i>		
AI survey biomass	9.30	8.77
EBS survey biomass	2.08	2.05
Catch biomass	0.00	0.00
Fishery age comp	276.50	298.19
Fishery length comp	166.05	213.05
AI survey age comp	160.25	176.07
AI survey length comp	8.01	7.50
EBS survey age comp	67.29	73.91
Maturity	2.71	2.71
<i>Priors and penalties</i>		
Recruitment	12.15	11.98
Prior on AI survey q	0.00	0.11
Prior on M	0.47	0.03
Fishery selectivity	97.07	108.12
Total negative log-likelihood	809.57	910.07
Parameters	164	164

# Fit to the EBS survey index

# BSAI fishery age composition

Fishery age composition data

# Fishery length composition

Fishery length composition data

# AI survey age composition

AI Survey age composition data

# EBS survey age composition

EBS Survey age composition data

Not a great fit to the EBS survey age compositions

2000 year class is strong in the AI age data, not so much in the EBS data

# Fishery selectivity

Model 16.3 (2024)

Model 24

# Terminal year fishery selectivity

# BSAI POP recruitment

# Phase plane plot

# Risk table considerations

- Assessment considerations: “data-inputs: biased ages, **skipped surveys**, lack of fishery-independent trend data; model fits: **poor fits to fits to fishery or survey data, inability to simultaneously fit multiple data inputs**; model performance: poor model convergence, multiple minima in the likelihood surface, parameters hitting bounds; estimation uncertainty: poorly-estimated but influential year classes; **retrospective bias in biomass estimates**.
- Level 2: Substantially increased uncertainty/unresolved issues. Strong retrospective bias that could represent model misspecification, but population dynamics and/or observational processes have not been identified. Poor residual pattern in fitting recent AI survey biomass estimates.

# Risk table considerations

- Population dynamics considerations: “decreasing biomass trend, poor recent recruitment, inability of the stock to rebuild, **abrupt increase or decrease in stock abundance**.”
- Level 1: Stock trends are typical for the stock; recent recruitment is in the normal range.

Rapid increase in the stock between 2006-2010 is somewhat unusual, although there is precedence for the stock rebuilding quickly from periods with strong recruitments. Recruitments for several recent year classes have been lower.

# Risk table considerations

- Environmental/ecosystem considerations: *“adverse trends in environmental/ecosystem indicators, ecosystem model results, decreases in ecosystem productivity, decreases in prey abundance or availability, increases or increases in predator abundance or productivity.”*
- Level 1: Normal. *“The recent stretch of increased temperatures could potentially have negative effects, but the recent increasing trend in the POP stock suggests that the temperature impacts have not been limiting.”*

# Fishery CPUE

Tons/hr, from tows targeting POP based on haul species composition. Source: North Pacific Groundfish Observer Program.

# Risk table considerations

- Fishery performance considerations: “fishery CPUE is showing a contrasting pattern from the stock biomass trend, unusual spatial pattern of fishing, changes in the percent of TAC taken, changes in the duration of fishery openings.”
- Level 1: No apparent fishery/resource-use performance and/or behavior concerns.

Fishery CPUE was relatively stable from 2004-2016. A decline in CPUE has occurred since 2017, which might be related to change in fishing practices in order to better avoid bycatch stocks.

# Reference points and ABCs

	2025			15,417	n/a	n/a
	2026			16,058	n/a	n/a

# Conclusions

- Continued high abundance of POP
- High survey biomass estimates have been keeping the estimated biomass in the assessment at a high level.
- Additional diagnostics have contributed to our understanding of the conflicts between the data sets
- Statistical estimation of ageing error (i.e., Punt method) would be useful

# Survey CPUE, 2010 – 2016 EBS surveys

2010 EBS Survey POP CPUE (scaled wgt/km<sup>2</sup>)

2012 EBS Survey POP CPUE (scaled wgt/km<sup>2</sup>)

2016 EBS Survey POP CPUE (scaled wgt/km<sup>2</sup>)

Year	EBS slope survey
2002	72,676 (0.53)
2004	112,582 (0.38)
2008	107,891 (0.41)
2010	203,460 (0.38)
2012	231,220 (0.33)
2016	357,379 (0.68)
