

C2 Gulf of Alaska Groundfish November 2024 Plan Team Report

Sara Cleaver, Jim Ianelli, and Chris Lunsford

NOAA
FISHERIES

December 2024, Presentation to the Advisory Panel

SAFE REPORTS

North Pacific Stock Assessment and Fishery Evaluation Reports: The Guidelines for Fishery Management Plans published by the National Marine Fisheries Service require that a stock assessment evaluation report (SAFE) be prepared and reviewed annually for each fishery management plan. The SAFE reports are intended to summarize the best available scientific information concerning the present, and future condition of the stocks, marine ecosystems, and fisheries under Federal management. Staff contacts are: BSAI Groundfish – [Diana Stram](#), GOA Groundfish – [Sara Cleaver](#), BSAI Scallops – [Diana Stram](#)

CURRENT YEAR GROUND FISH SAFES

The 2024 groundfish SAFE report chapters (including the introduction for both the BSAI and GOA) for the December Council meeting are provided below. Previous assessments from 2023 are available [here](#).

GOA Ecosystem Status Report (ESR)—Plan Team discussion

- No formal recommendations but...ideas for future work:
 - Explore portfolio effects methods for community-wide consumption
 - Validate conceptual models
 - Develop composite indicators
 - Explore ecosystem dynamics due to trawling (EGOA vs CGOA/WGOA)
 - Provide a recap of previous year's highlights

2024 Gulf of Alaska Ecosystem Status Report: IN BRIEF

Overview

- Long-term trends in the Gulf of Alaska (GOA) include warming ocean temperatures, changes in salinity, and a shift in the groundfish community to more zooplankton-eating fish.
- Moderate El Niño conditions occurred during the winter of 2024, including warm winter and spring surface temperatures and increased shelf circulation. Few ecological responses to the warm event were observed.
- Feeding conditions for groundfish improved from 2023 to generally above average. Biomass of zooplankton increased, including larger, nutritious species (large copepods, euphausiids). Forage fish (herring, capelin, others) abundance continued to be above average across the GOA.
- GOA commercial salmon landings were some of the lowest since 1985, driven by unexpected low returns of pink salmon in Prince William Sound. Low returns were probably due to poor juvenile marine survival in 2023 and potential competition in the ocean gyre (2023/2024).
- While the GOA continues to warm over the long term, 2025 is predicted to be cooler than the 1991 – 2020 average due to developing La Niña conditions.

Thanks to Bridget Ferriss

Revenue changes (and source), 2021-2022

GOA First-Wholesale Revenue Change in 2021-2022 Decomposed by Species Group

Revenue changes (and source), 2022-2023

GOA First-Wholesale Revenue Change in 2022-2023 Decomposed by Species Group

Ex-vessel value of the GOA groundfish catch 2007-2023

2025 GOA bottom-trawl survey re-stratification

- ❖ The Team agreed re-stratification an improvement and recommended:
 - ❖ re-calculating the time series of design-based indices of abundance and age composition in steps
 - ❖ Present percent differences by area and combined
 - ❖ assuring shapefiles be available

- ❖ To be taken up internally at AFSC

Total	214,879	575,234	566,924	down 8,310 (1%)

GOA Pollock Ecosystem and Socioeconomic Profile (ESP)

Ecosystem (ABC Information):

- Overall average (YOY ↑, juv ↔, adult ↓)
- No heatwave, avg temp, moderate habitat conditions, few larval indicators (no survey) but sufficient prey based on seabirds
- High nearshore CPUE in beach seine
- Adult condition mixed, low biomass consumed, but high sablefish and POP
- DSEM + integrated in model

Socioeconomic (TAC Information):

- CPUE decreased in winter & spring, less concentrated
- May impact roe quality, ex-vessel price low

GOA Pollock: Full

Author's 2025 ABC = 181,022 t

- Increase of 56% from 2023
- 2026 ABC decreases to 133,075 t
- No reduction from max ABC

Changes (cumulative) to model:

- 23a: Revamped ISS & CVs
- 23b: Environmental covariate on catchability
- 23c: Remove age 1 and 2 Shelikof indices
- **23d: Use Dirichlet-multinomial**

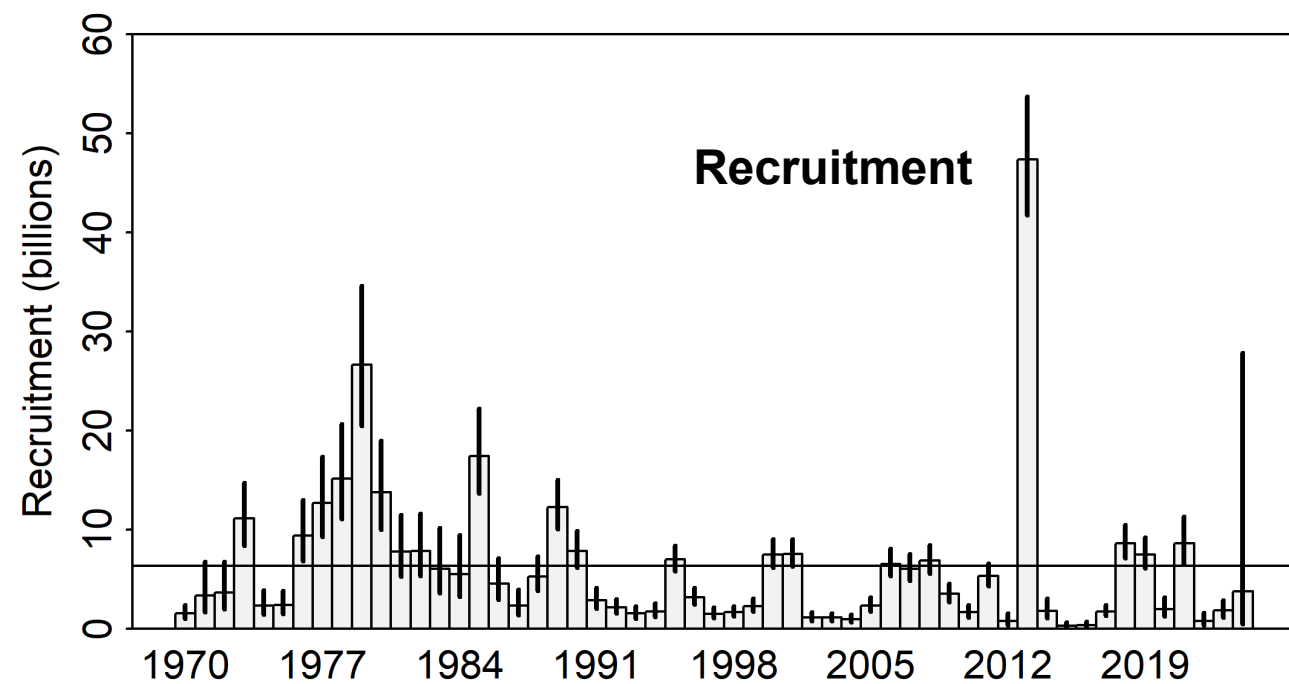

Concerns:

- Poor fit to NMFS bottom trawl index

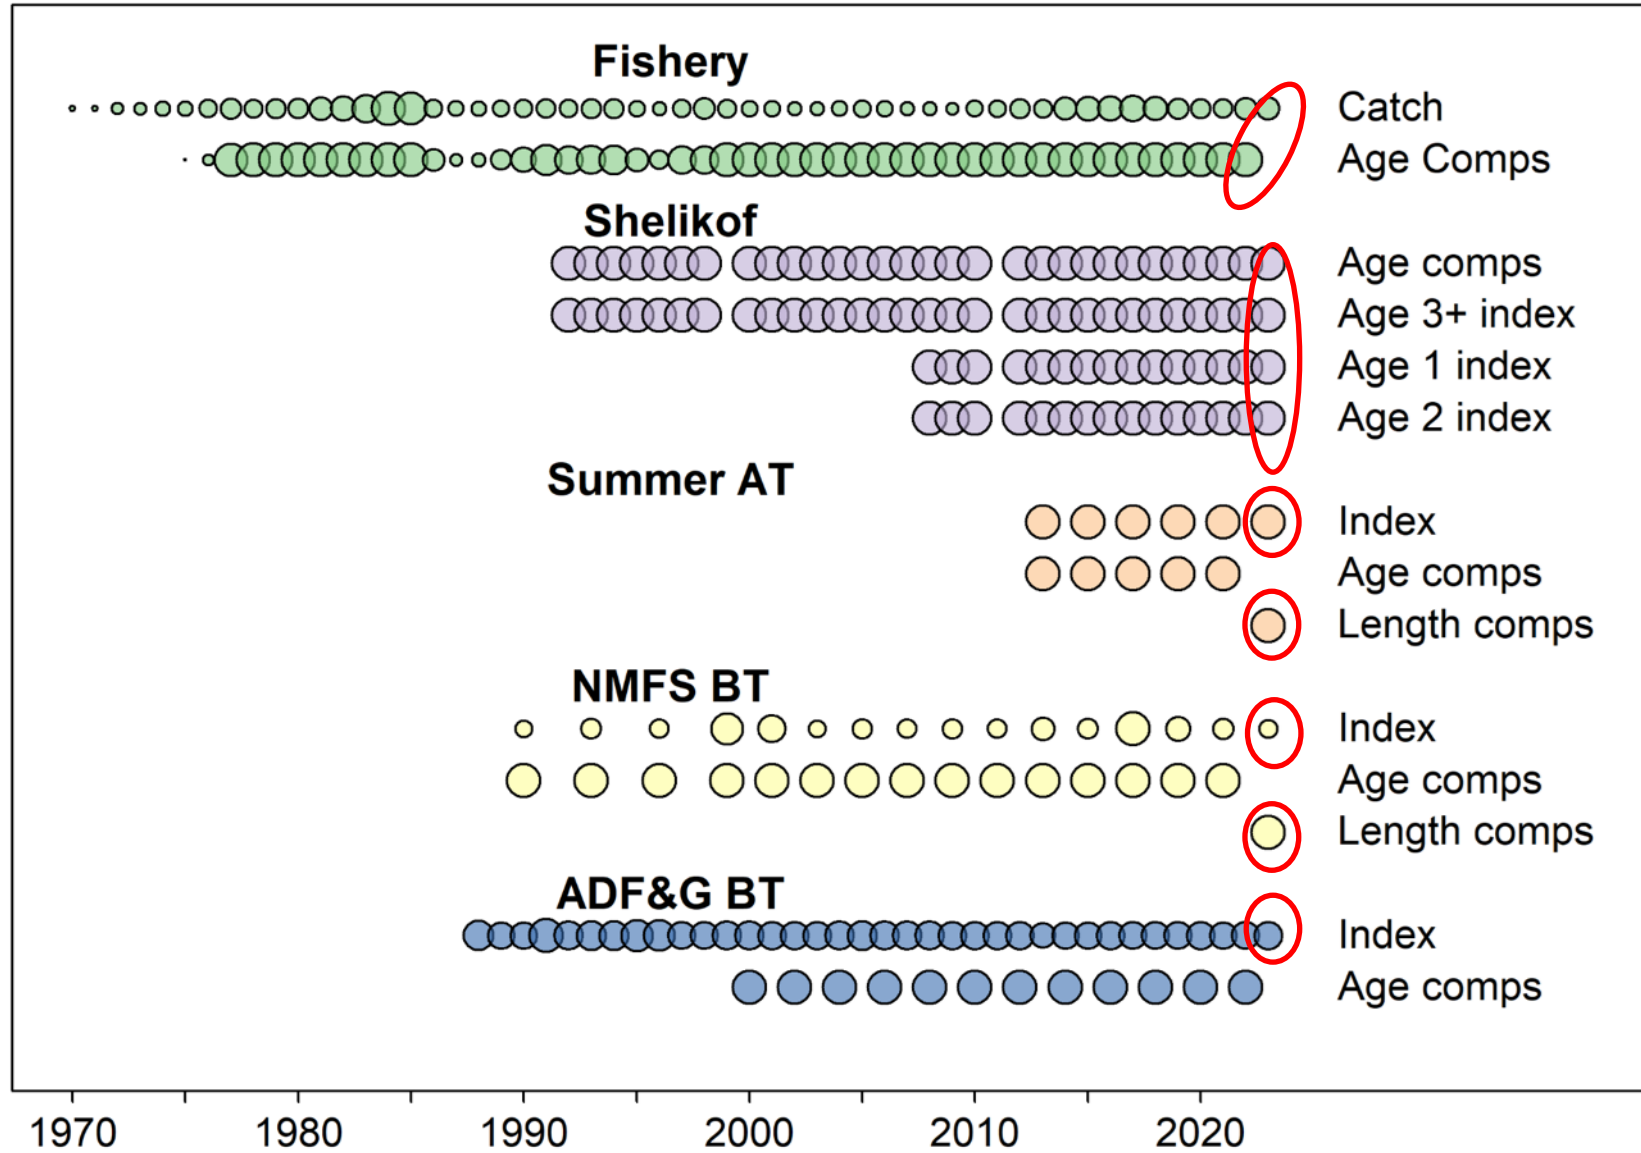

Positives:

- 2017, 2018, 2020 cohorts above average
- Better retrospective pattern

Thanks to Cole Monnahan

GOA Pollock: Data

GOA Pollock: Catch

2023 projected catch = 145,215 t

2023 realized catch = 135,103 t

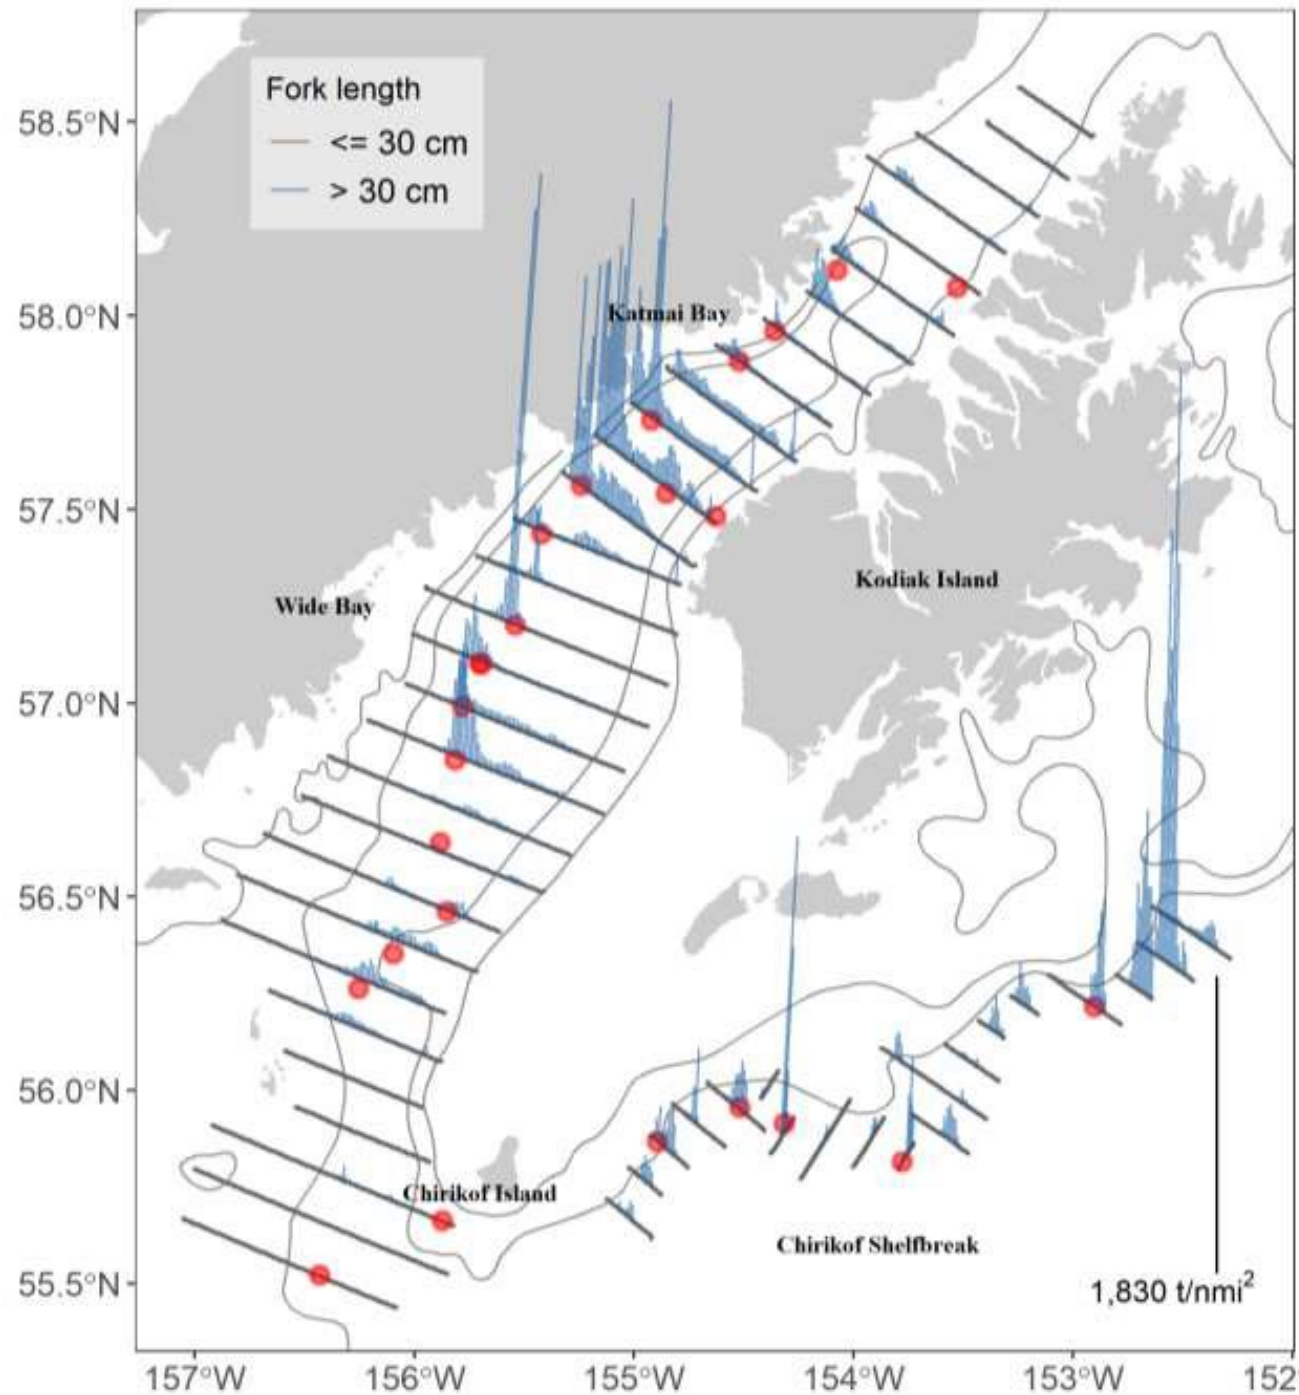

2024 projected catch = 131,000 t
(CGOA closure in Sep-2024)

GOA Pollock: 2024 Shelikof Strait acoustic trawl survey

- Shelikof up 12%
 - No small fish (similar to 2023)
- Chirikof up 189% to 115 kt

GOA Pollock: Sequential addition of data

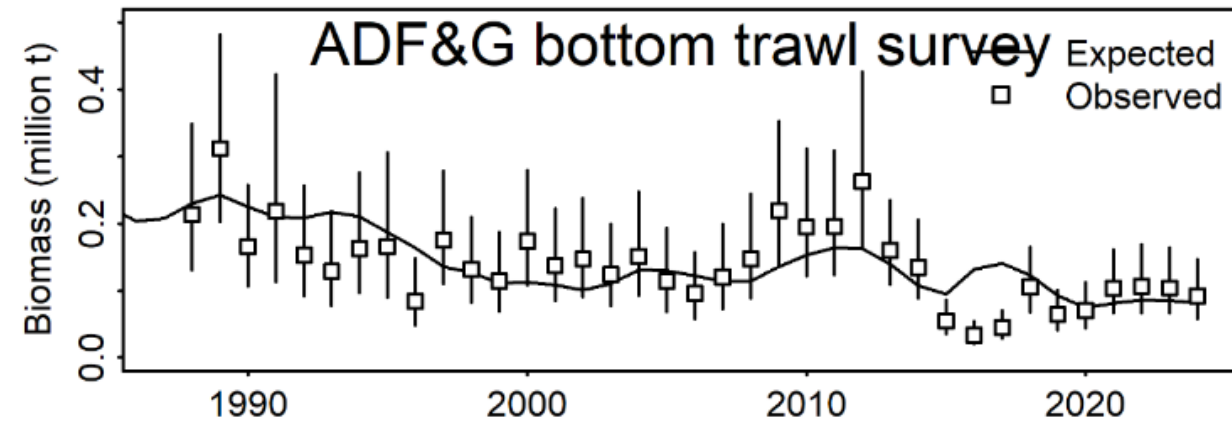

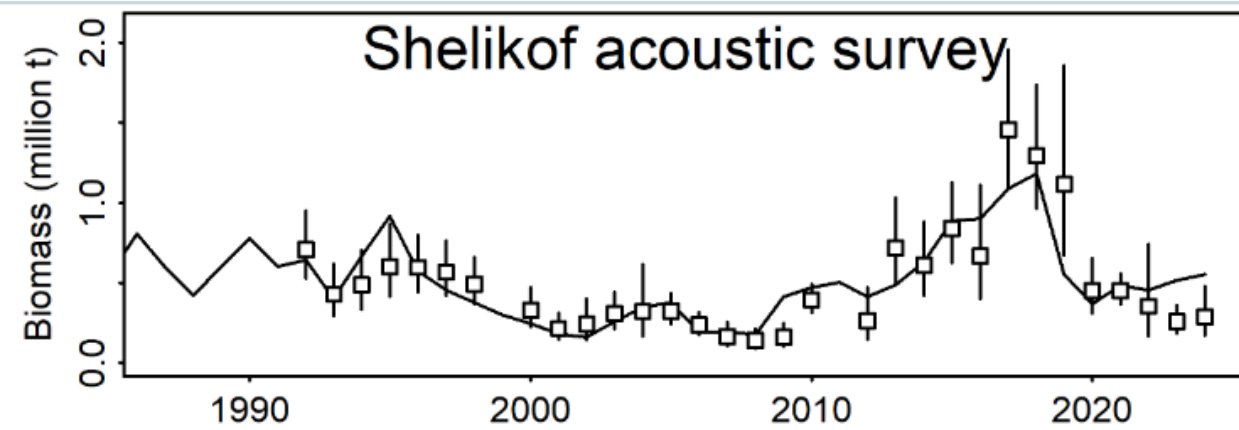

- Track 2023 accepted model (23) changes as new data are added
- Relatively stable trend and scale compared to 2023

Index fits

- Improved Shelikof fits (q-link); poor NMFS BT

GOA Pollock: Team Discussion

The Team agreed with the authors' recommended model (Model 23d) etc.

The Team recommended:

- evaluating vertical distribution of pollock in the water column due to the lack of fit to the bottom trawl survey
- looking into methods that allow inclusion of additional surveyed areas not currently included in the winter survey index estimates
- evaluating dropping 3-year-olds from the Shelikof Strait survey, which would also include reevaluation of dropped age 1 and 2 data

GOA Pacific cod

Species	2024 catch	ABC 2024	ABC 2025	Change
Pollock	124,944	200,489	190,771	down 9,718 (5%)

Total	214,879	575,234	566,924	down 8,310 (1%)

GOA Pacific cod Ecosystem and Socioeconomic Profile (ESP)

Ecosystem (ABC Information):

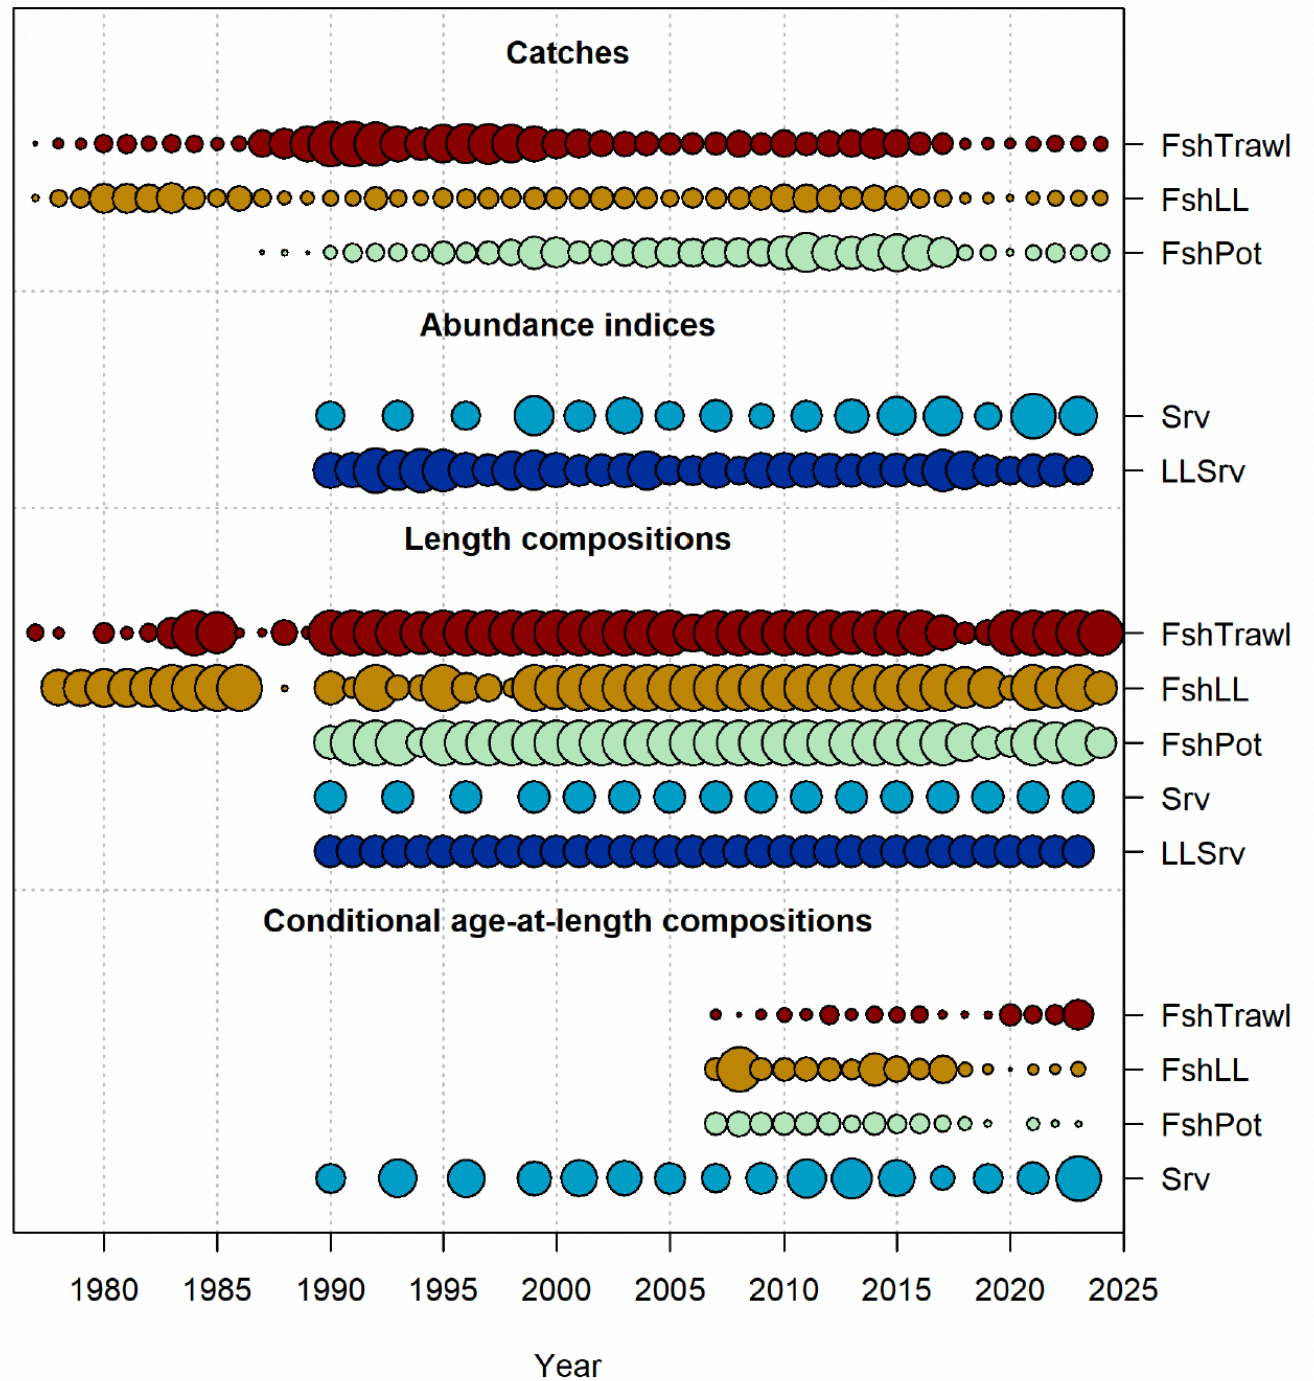

- Overall above average (YOY ↑, juv ↔, adult ↔)
- No heatwave, below average habitat suitability, reduced energy and transport
- Sufficient prey, nearshore YOY just below average
- Age-1 natural mortality consistently above the operational model
- Below average bioenergetic demand, low biomass consumed

Socioeconomic (TAC Information):

- Ex-vessel value low for five of last six years
- Price decreased and below avg
- Revenue/unit effort < from historic high to below avg

GOA Pacific cod

GOA Pacific cod

- Environmental with AFSC longline survey catchability included

Catchability — No covariate — Random — Recommended

GOA Pacific cod: Team Discussion

- The Team agreed with the authors' recommended model (Model 24.0) and the authors' recommended ABCs and OFLs, with no reduction from maxABC.
- The Team recommended: continued work on the modeling of size and weight at age, potentially including:
 - whether the conditional age-at-length data needs to be corrected for length-stratified survey sampling;
 - evaluating time-varying growth;
 - using age compositions rather than conditional length at age; and
 - using empirical estimates of length and weight at age.

GOA Other rockfish

“The Council is considering a motion to change the spatial management of demersal shelf rockfish (DSR), by moving DSR species out of the other rockfish category to a GOA wide assessment. The SSC supports making this change to the DSR complex in the 2024 stock assessment for implementation for the 2025 fisheries and looks forward to examining the area apportionment at that time.” (SSC, October 2023)

- Was therefore an update assessment to reflect the species membership change in the stock complex (i.e., removal of DSR species from Other Rockfish)

Demersal shelf rockfish (DSR) Team discussions

- The Team discussed the IPHC CPUE standardization and noted that issues related to hook competition could be improved. Consequently, the Team recommended
 - **that this could be addressed by treating the data as compositional data and using information about total catch of other species and examining empty hooks for target and non target species. Also..**
 - examining the effect of this survey effort reduction on the catch estimates and compositions.

Demersal shelf rockfish (DSR) Team discussions

The Team noted that

- more exploration of estimating M needed
 - A change in the value of M has a large impact on reference points could be helped by more evaluation
- Authors suggested 20% reduction in maxABC based on the risk table analysis
 - **Instead, The Team recommended using a natural mortality value of 0.02 applied to the new standardized IPHC CPUE index for determining maxABC/OFL for 2025.**
- The Team agreed with the author's recommended ABC/OFLs for the remaining Tier 6 Southeast Outside and W/C/WY species.

Thornyhead Rockfish

Species	ABC 2024	ABC 2025	Change
POP	39,719	38,962	down 757 (2%)
northern rockfish	4,815	5,076	up 261 (5%)

Dusky	7,624	6,338	down 1,286 (17%)
Rougheye and Blackspotted Rockfish	1,037	1,180	up 143 (14%)
Demersal shelf rockfish	283	394	up 111 (39%)
Thornyhead	1,628	1,338	down 290 (18%)
Other rock	3,774	3,505	down 269 (7%)
Sub Total	59,527	57,440	down 2,087 (4%)

GOA Thornyhead Stock Complex model updates

Tier 5 complex – represented by shortspine thornyhead *Sebastolobus alascanus* (longspine thornyhead *S. altivelis* in complex but not model)

- Changes in the input data
 - Bottom trawl survey biomass and errors from the 1990 to 2023 updated.
 - Longline survey RPWs and errors from 1992 to 2023 updated.
- Changes in assessment methodology
 - Common process-error instead of area-specific values

Thanks to Kevin Siwicke and Katy Echave

Thornyhead catch – 2024

Area	OFL	ABC	TAC	Catch
W	n/a	314	314	34

Thornyhead rockfish

Area	2025 Biomass (t)	% of Biomass	ABC (t)	% Change from 2024
Western GOA	10,514	15%	206	-34%
Central GOA	25,643	44%	590	-17%
Eastern GOA	23,302	41%	542	-13%
GOA-wide	59,459	100%	1,338	-18%

- ~84% of decline from new/updated survey data
- ~16% related to the model change

Thornyhead: Stock Structure Summary (Echave)

Data suggest current practice ok

- But data limited...
- Genetic differentiation lacking
- Growth similar
- Movement limited based on tags
- Fishing distribution consistent with abundance

Thornyhead Recommendations

- Author recommendations:
 - Use Model 24.2 with single process error, single scaling coefficient, and additional observation error for both surveys.
 - Note the low catches following sablefish transition to pots.
- Plan Team agreed with the author's recommendation
 - Noted decrease in RPN/RPW in the longline survey in all three regions, and a similar (but less definitive) decline in the bottom trawl survey (primarily evident in the western GOA).
 - The Team cautioned this could indicate a concerning trend considering catches are low and recommended tracking further changes in thornyhead population levels over the coming cycles.

	Catcher vessel	All	19
Pot	Catcher vessel and catcher/processor	All	32

A black dog with floppy ears is sitting on the blue edge of a boat, looking out over a large body of blue water. In the background, there are green, forested mountains under a clear blue sky. A red buoy is visible on the boat's side. The image is framed by a light blue background with a pattern of water droplets.
