WORLD METEOROLOGICAL ORGANIZATION
Weather Climate Water

Greenhouse gases reached record observed levels in 2023.

Real time data indicate that they continued to rise in 2024.

CO_2 420.0 ppm ± 0.2
151% of pre-industrial levels

CH_4 1934 ppb ± 2
265% of pre-industrial levels.

N_2O 336.9 ppb ± 0.1
124% of pre-industrial levels

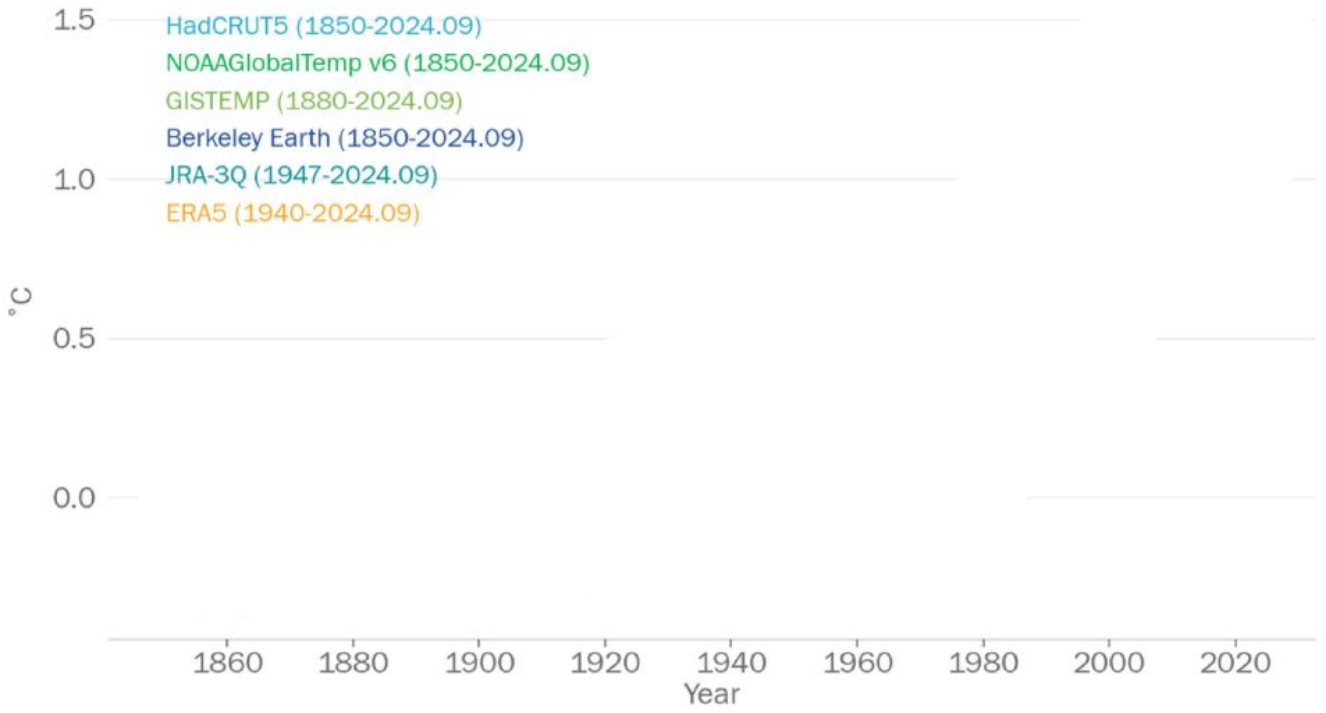

Figure 1: Annual global mean temperature anomalies (relative to 1850–1900) from 1850 to 2024 from six datasets. The 2024 average is based on data from January-September.

January-September 2024 was 1.54±0.13°C above the pre-industrial average.

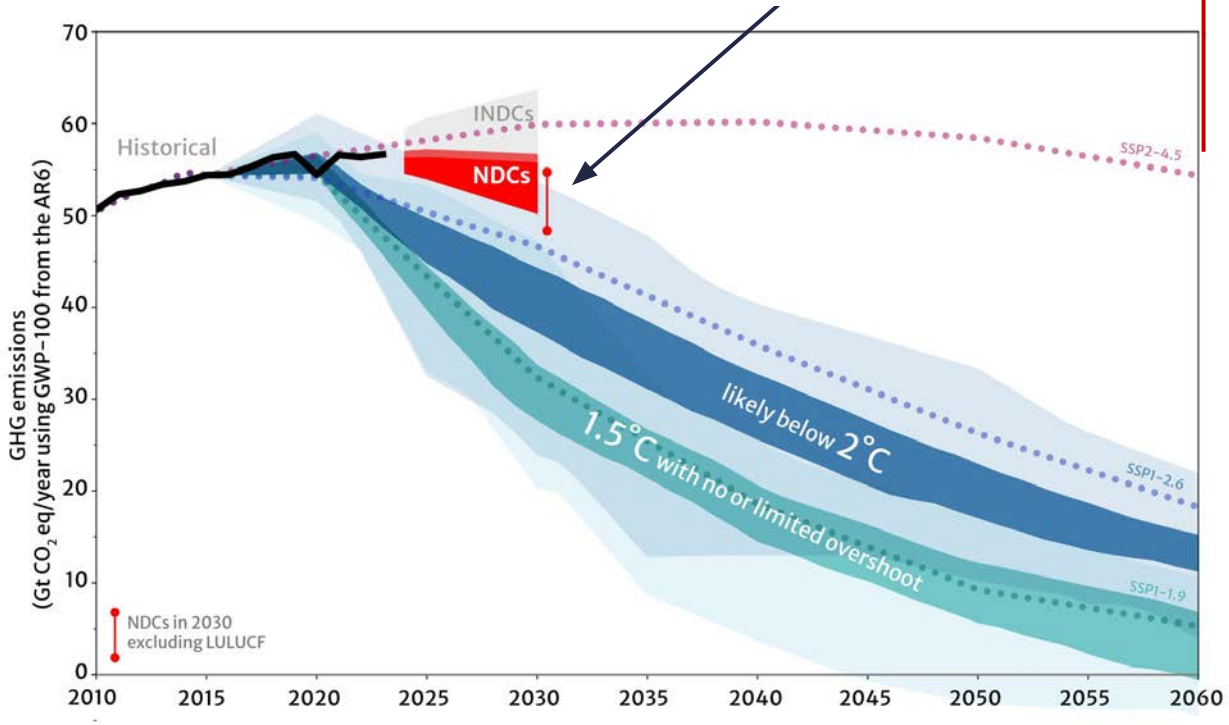
UNFCCC 2022 Nationally Determined Contributions (NDCs) Synthesis report

With full implementation of the 2022 revised NDCs and conditional elements



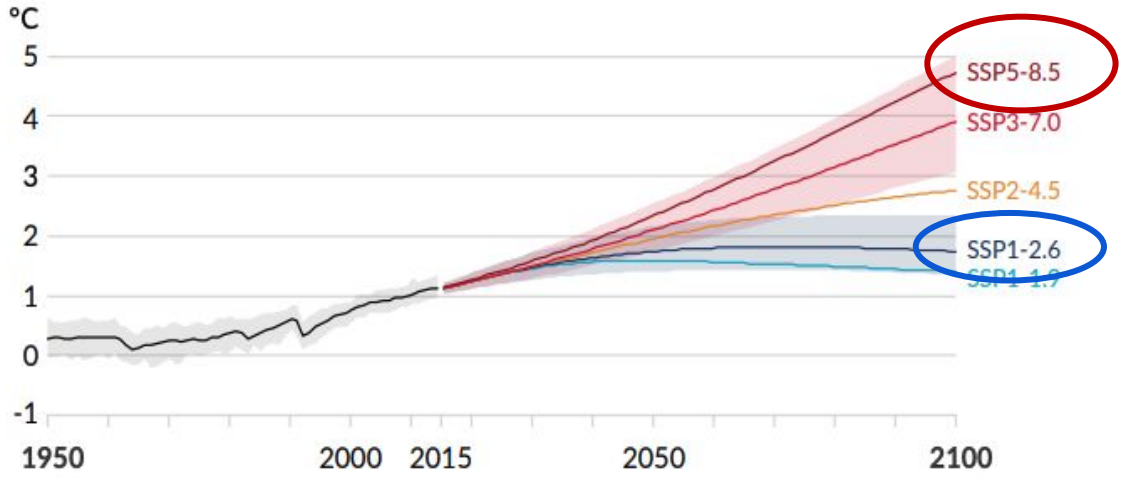
ACLIM found fisheries have higher risk above this (SSP585, RCP8.5)

ACLIM found fisheries have lower risk in this scenario (SSP126)

Emissions figure: https://unfccc.int/process-and-meetings/the-paris-agreement/nationally-determined-contributions-ndcs
Paris Agreement Figure: https://sustainability.yale.edu/explainers/yale-experts-explain-paris-climate-agreement

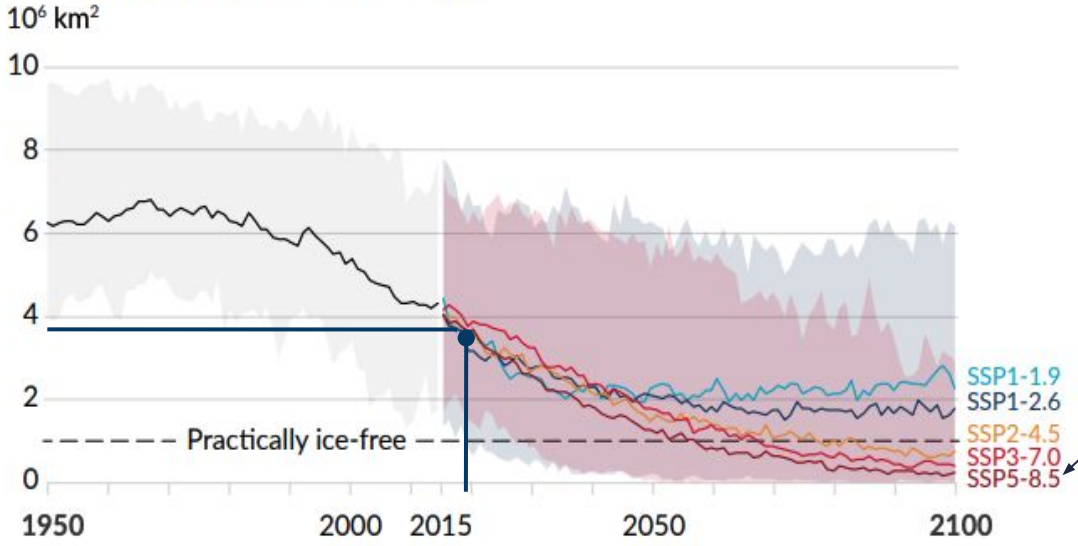
Climate change is expected to continue to impact AK Ecosystems & Fisheries

a) Global surface temperature change relative to 1850-1900



Warming will continue and is greater in scenarios with **low CO_2 mitigation and higher warming**

b) September Arctic sea ice area



Sea Ice will continue to decline, more so under scenarios with **high global warming and low CO_2 mitigation**

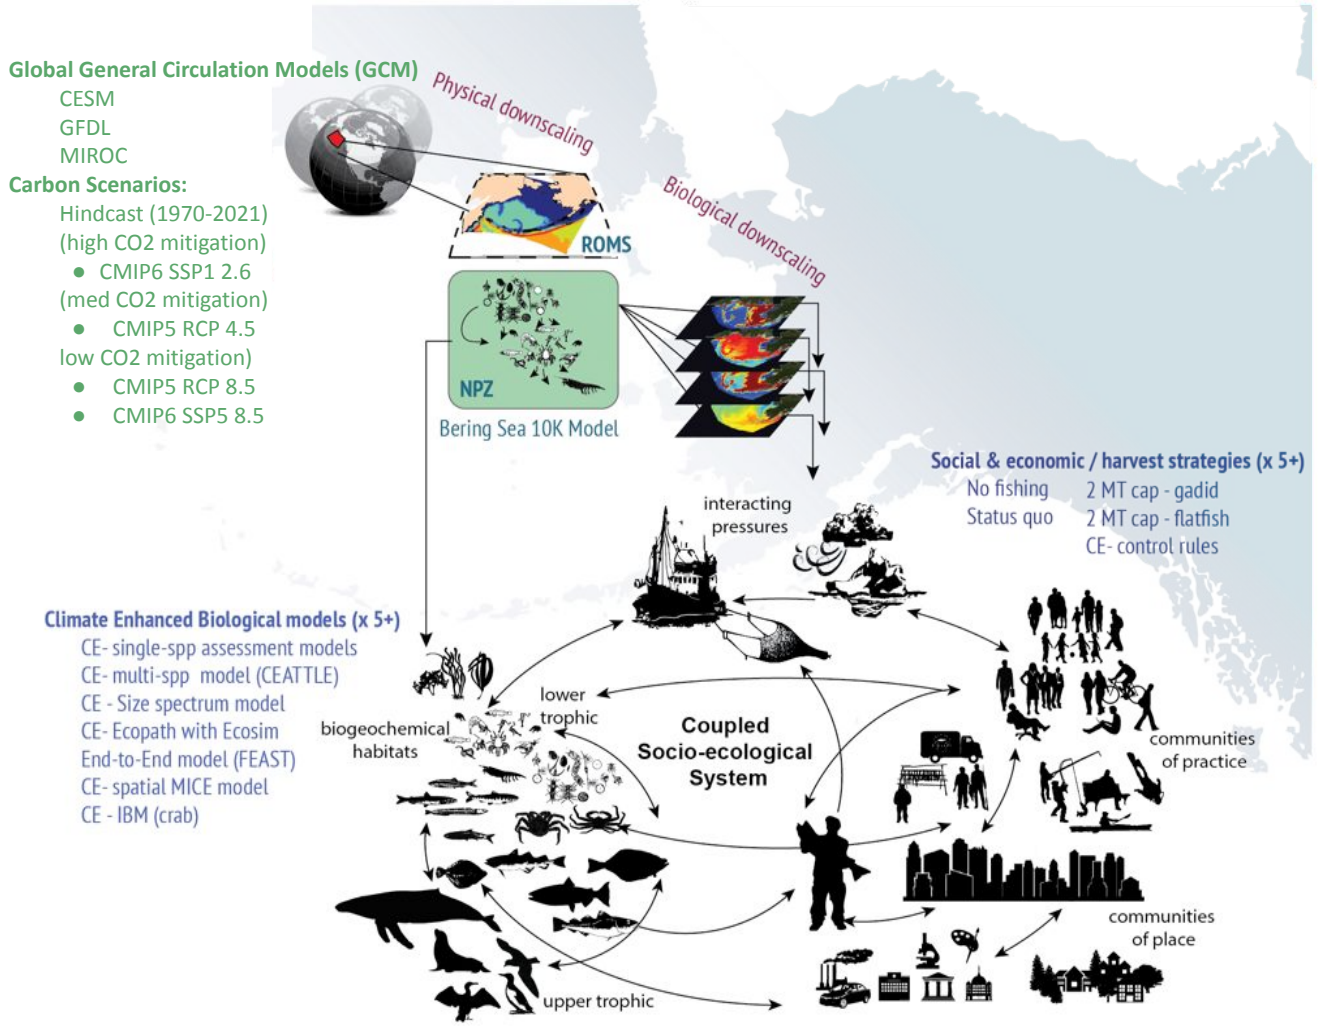
The Alaska Climate Integrated Modeling Project



Goal: To address climate information needs with best available science & tools

What to expect?

- Project physical and ecological conditions under levels of climate change (levels of global carbon mitigation)
- Characterize uncertainty

What can be done?

- Evaluate effectiveness of adaptation actions including those supported by fisheries management

Scenarios form the basis for comparative simulations & Management Strategy Evaluations

The Alaska Climate Integrated Modeling (ACLIM) project represents a comprehensive, multi-year, interdisciplinary effort to characterize and project climate-driven changes to the eastern Bering Sea (EBS) ecosystem, from physics to fishing communities. Results from the ACLIM project are being used to understand how different regional fisheries management approaches can help promote adaptation to climate-driven changes to sustain fish and shellfish populations and to inform managers and fishery dependent communities of the risks associated with different future climate scenarios. The project relies on iterative communications and outreaches with managers and fishery-dependent communities that have informed the selection of fishing scenarios. This iterative approach ensures that the research team focuses on policy relevant scenarios that explore realistic adaptation options for managers and communities. Within each iterative cycle, the interdisciplinary research team continues to improve: methods for downscaling climate models, climate-enhanced biological models, socio-economic modeling, and management strategy evaluation (MSE) within a common analytical framework. The evolving nature of the ACLIM framework ensures improved understanding of system responses and feedbacks are considered within the projections and that the fishing scenarios continue to reflect the management objectives of the regional fisheries management bodies. The multi-model approach used for projection of biological responses, facilitates the quantification of the relative contributions of climate forcing scenario, fishing scenario, parameter, and structural uncertainty with and between models. Ensemble means and variance within and between models inform risk assessments under different future scenarios. The first phase of projections of climate conditions to the end of the 21st century is complete,

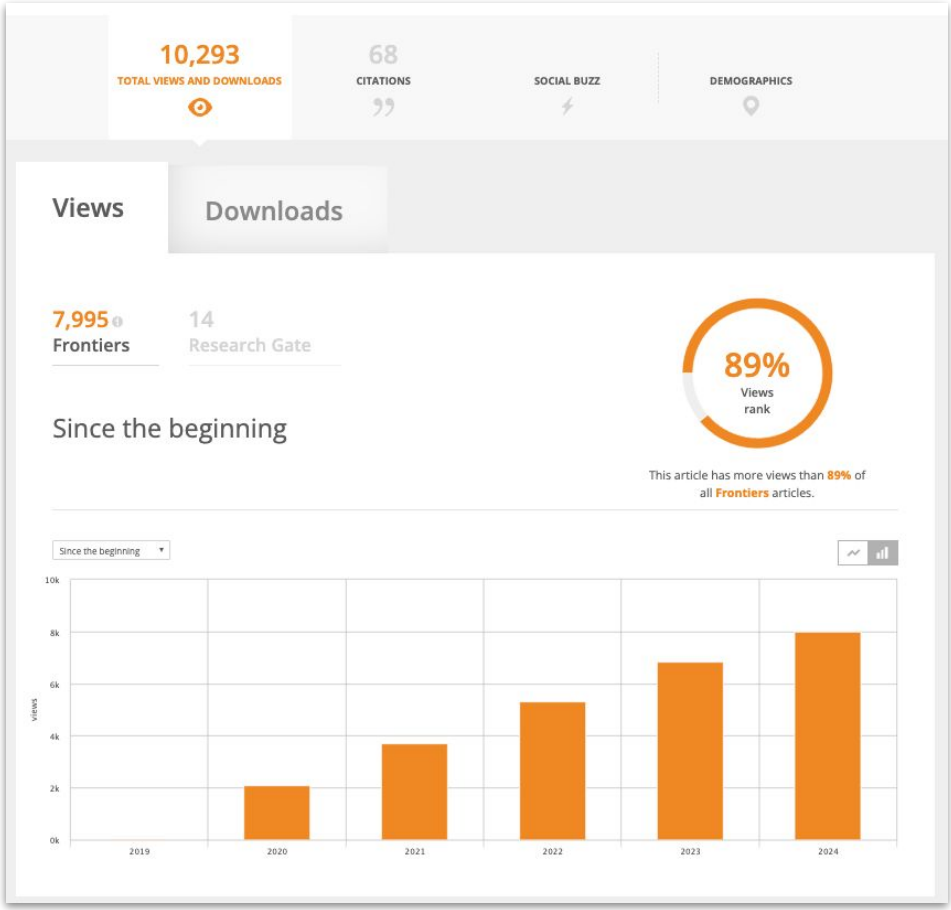
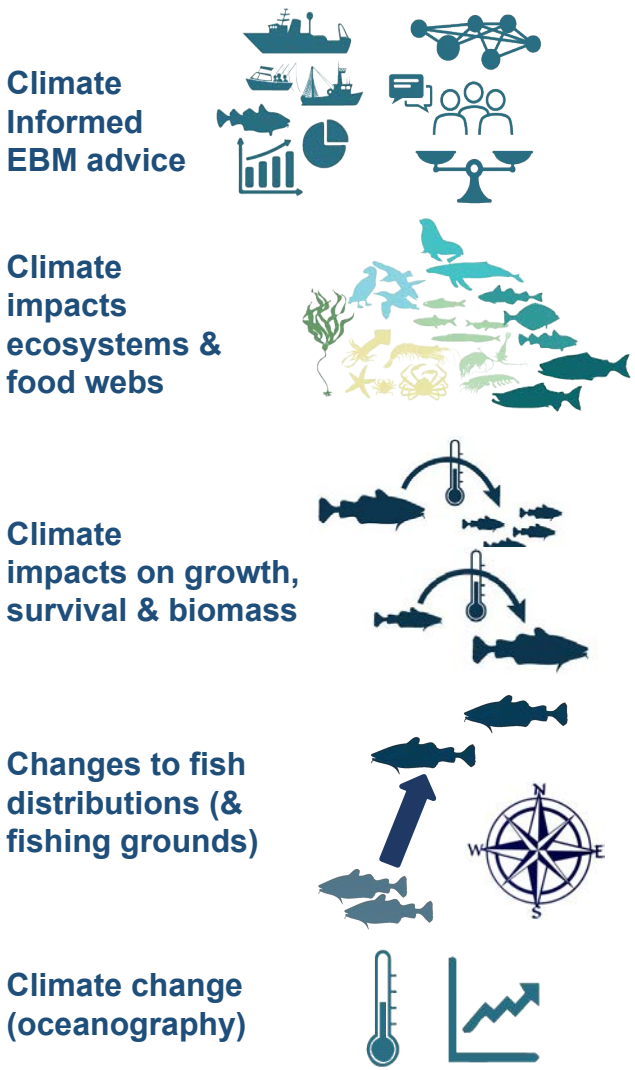
ACLIM overview paper



Also see list of 20+ publications at end of ppt

Key Takeaways from ACLIM to date



1. Need to account for ecosystem-wide productivity changes
2. Manage predator-prey Interactions using new approaches
3. Need to (and can) adapt to climate-driven species range shifts
4. Expand Ecosystem-Based Fisheries Management through coordination and collaboration
5. Address uncertainty with ensembles and participatory scenario planning
6. Incorporate socio-economic resilience into planning and response
7. Strengthen research and monitoring infrastructure

Key Outcomes of ACLIM to date

1. **Provided baseline engineering capacity for ocean and ecosystems predictions and forecasts**
2. Identified key couplings, and gaps and needs in linked climate- oceanographic- biological- social-economic models
3. Evaluated trajectories under future scenarios, alternative management strategies, alternative harvest control rules → emergent understanding of common pitfalls and best practices
4. Sustained community of practice for climate-informed advice, including support for partnership building around adaptation planning

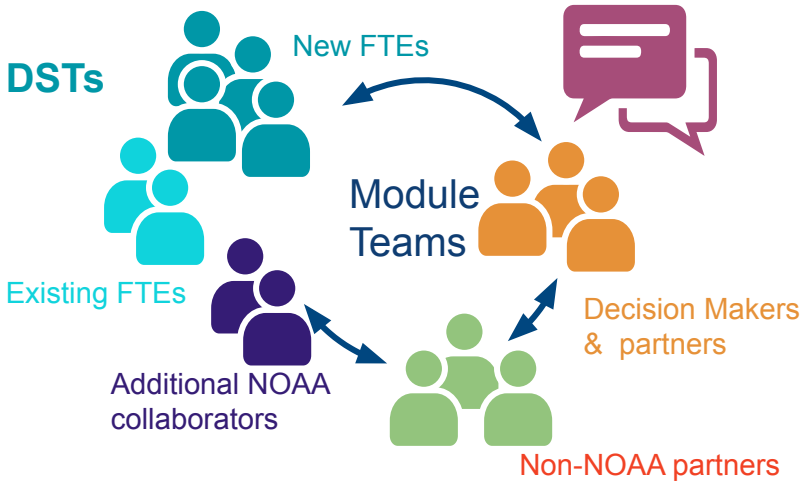
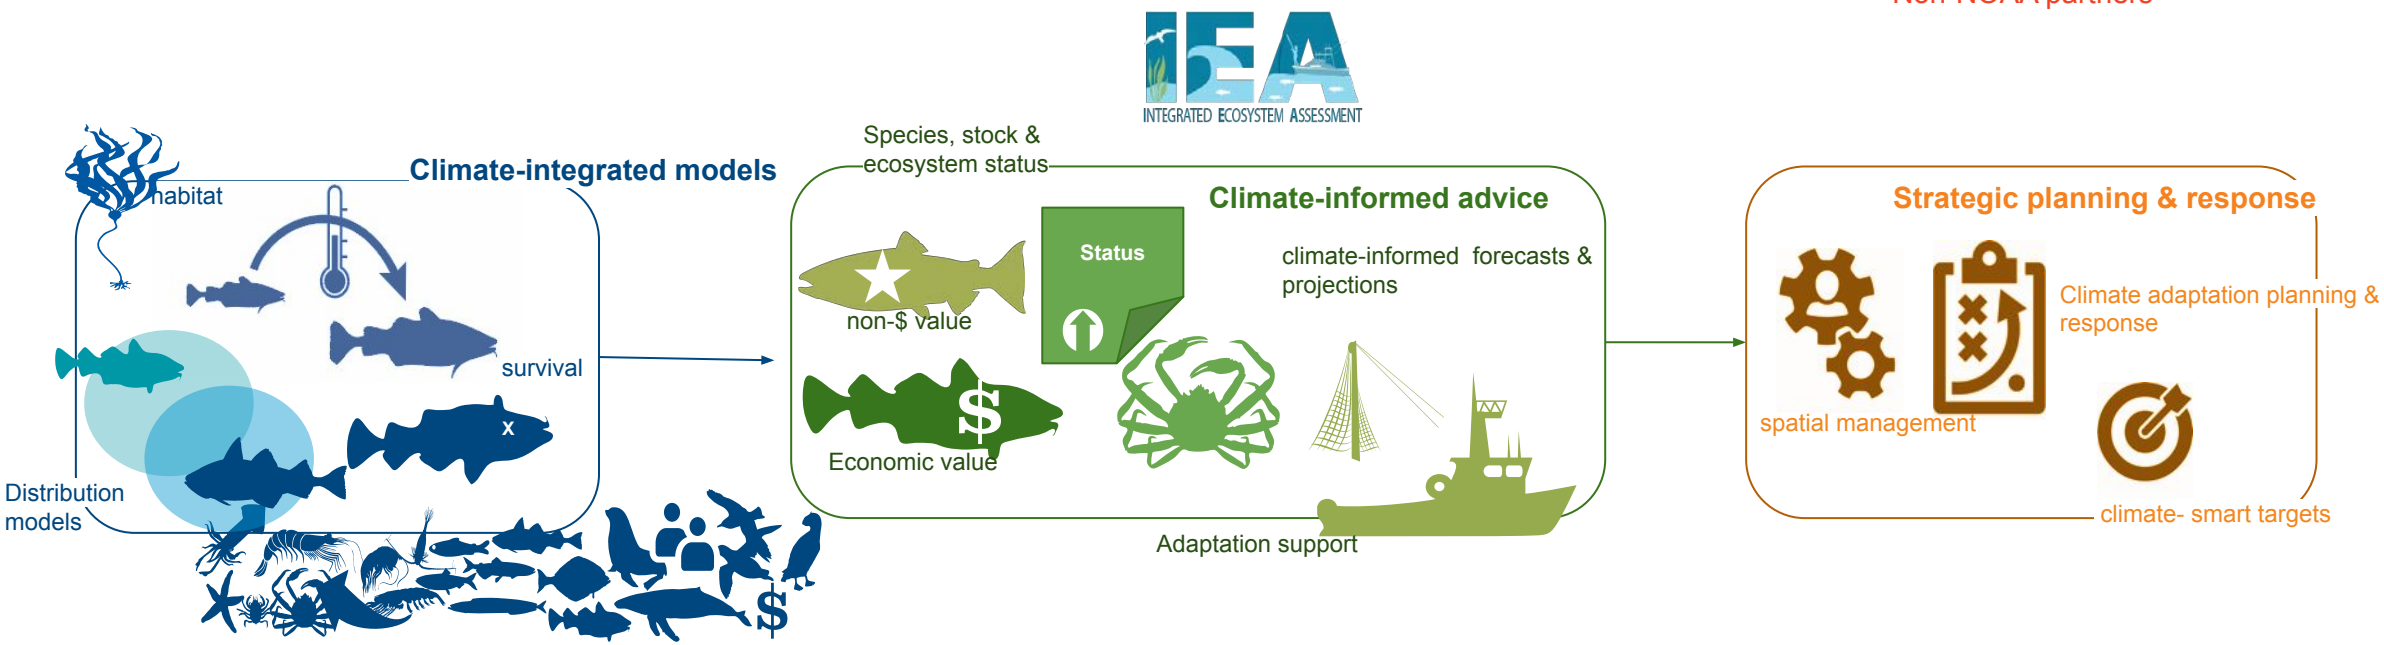
NOAA Climate, Ecosystems, & Fisheries Initiative

Decision Support Teams

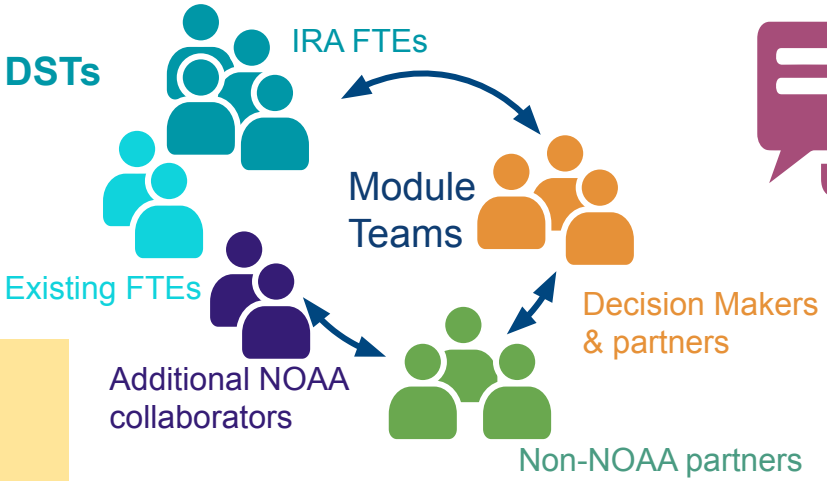
Co-generate regionally, locally, and community tailored tools & advice





What are Decision Support Teams?

Transdisciplinary nested teams that will help deliver climate informed products and advice, specifically tailored to decision maker needs.



1) Understand current capacity for inclusion of climate informed advice
2) Identify near-term needs for CI-advice
3) Identify long-term needs for development
4) Link CEFI, IEA, Stock Assessment, and Other NOAA products to meet needs

Support and co-leverage

not repeat or re-invent

Decision Support Delivery Steps

2024

Step 1: Engagement & Partnership Building

Identify key partners and collaborators and begin or advance discussions around climate change planning and needs

2024

Step 2: Co-identify on-ramps

In coordination and collaboration with partners and decision makers, identify existing and needed climate specific decision support needs

2025

Step 3: Co-identify needs & prioritize

Co-identify needs and prioritize decision support information, needs, and products

2025

Step 4: Design, build & TEST

Match resources and tools to needs and test skill relative to co-identified metrics of performance

2027

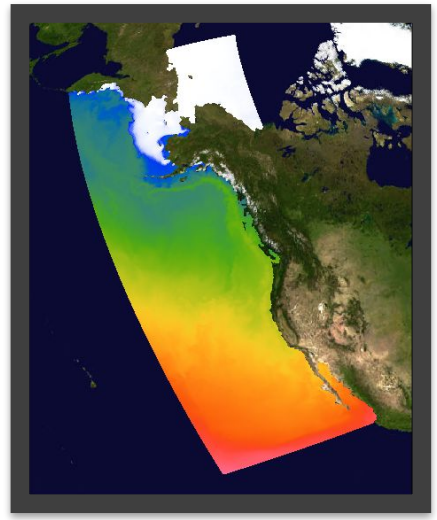
Step 5: Deliver & refine

Deliver decision support tools and advice; iterate and refine products with feedback and engagement

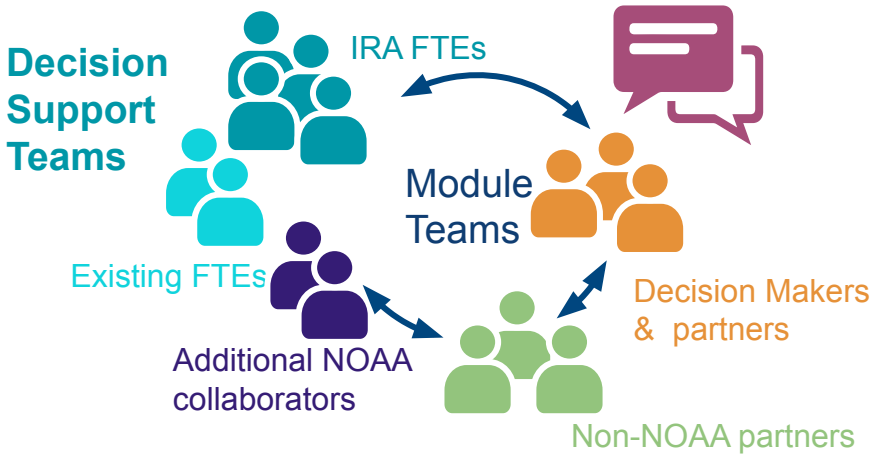
MOM6

Parallel process

Test ocean model output



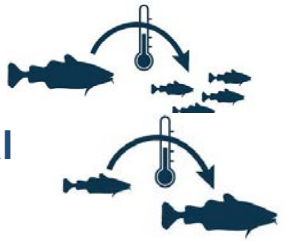
- **Is there an existing tool/product that meets the need?**
- **Do the scales match advice?**
- **Does the output skillfully meet needs?**



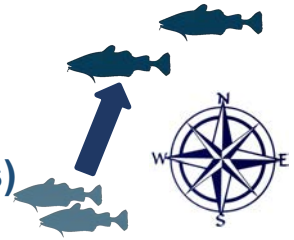
Types of Management Actions

Climate impacts ecosystems & food webs

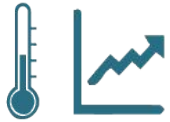
Climate impacts on growth, survival & biomass



Changes to fish distributions (& fishing grounds)



Climate change (oceanography)



Climate Informed EBM advice

- Catch Quotas
- Gear Types and Seasons
- Bycatch and PSC Limits
- Protected Resources
- Habitat
- Community Protections
- Limited Access Privileges

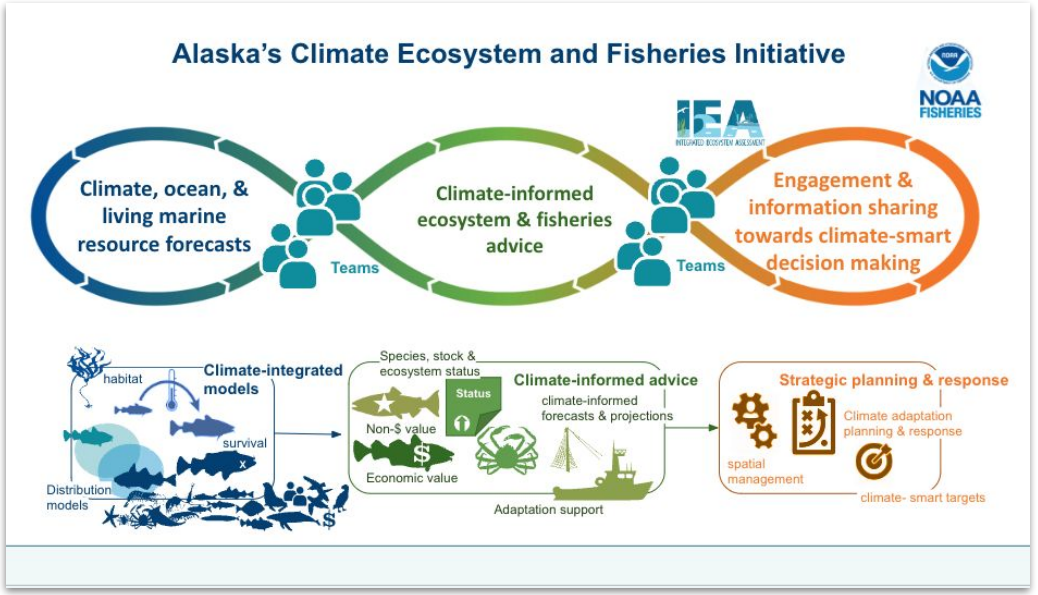
Draft Focal Areas for Alaska CEFI

FOCAL AREA 1: Web accessible and regionally tailored climate change products & trainings (cross cutting)

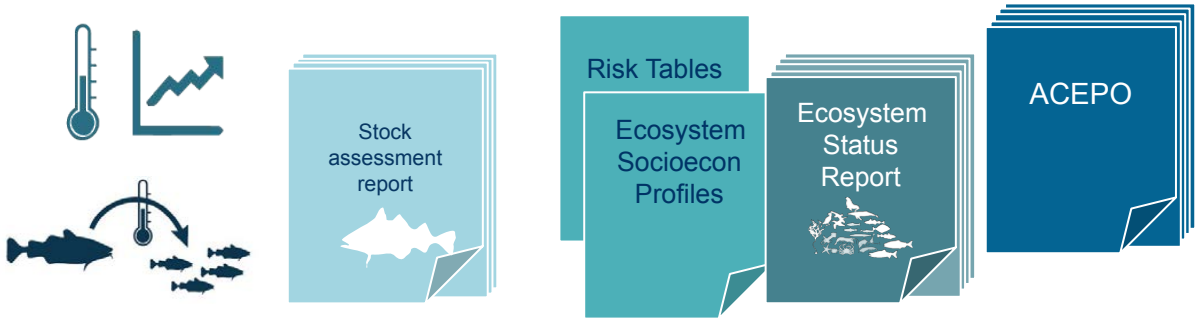
FOCAL AREA 2: Climate-integrated fisheries assessments and EBM

FOCAL AREA 3: Decision support for Climate aware regulatory frameworks

FOCAL AREA 4: Climate resilience community planning and response

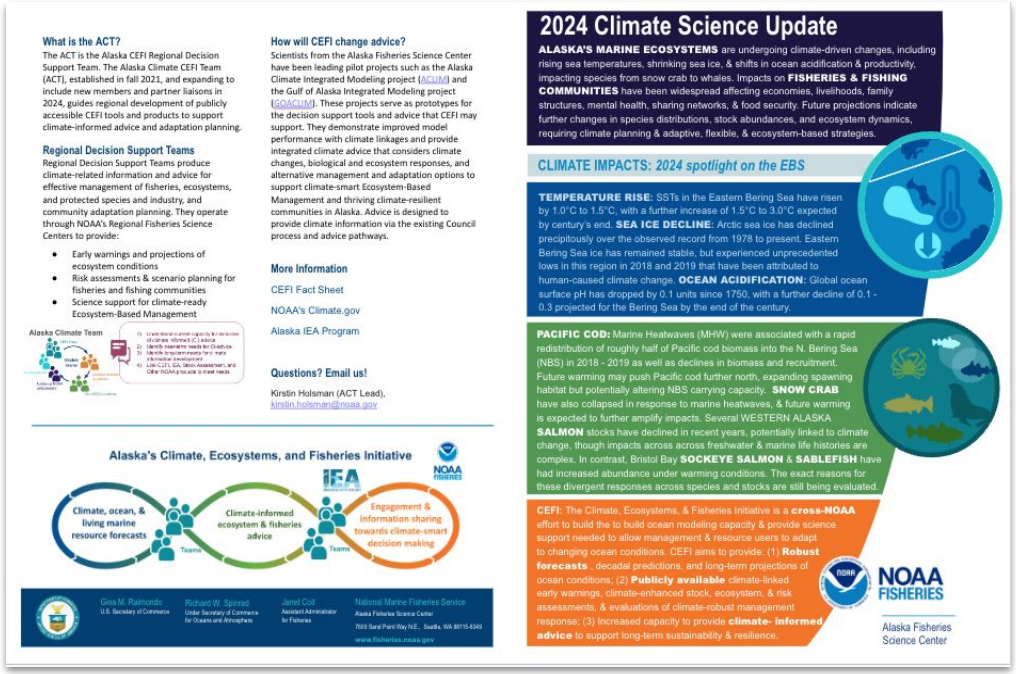


Provide in addition to climate information on-ramps in ESPs, ESRs, Stock assessments, ACEPO, etc.



New this year: Prototype Climate information overview

Feedback welcome!



What is the ACT?

The ACT is the Alaska CEFI Regional Decision Support Team. The Alaska Climate CEFI Team (ACT), established in fall 2021, and expanding to include new members and partner liaisons in 2024, guides regional development of publicly accessible CEFI tools and products to support climate-informed advice and adaptation planning.

Regional Decision Support Teams

Regional Decision Support Teams produce climate-related information and advice for effective management of fisheries, ecosystems, and protected species and industry, and community adaptation planning. They operate through NOAA's Regional Fisheries Science Centers to provide:

- Early warnings and projections of ecosystem conditions
- Risk assessments & scenario planning for fisheries and fishing communities
- Science support for climate-ready Ecosystem-Based Management

How will CEFI change advice?

Scientists from the Alaska Fisheries Science Center have been leading pilot projects such as the Alaska Climate Integrated Modeling project (ACLIM) and the Gulf of Alaska Integrated Modeling project (GOACLIM). These projects serve as prototypes for the decision support tools and advice that CEFI may support. They demonstrate improved model performance with climate linkages and provide integrated climate advice that considers climate changes, biological and ecosystem responses, and alternative management and adaptation options to support climate-smart Ecosystem-Based Management and thriving climate-resilient communities in Alaska. Advice is designed to provide climate information via the existing Council process and advice pathways.

Alaska's Climate, Ecosystems, and Fisheries Initiative

Climate, ocean, & living marine resource forecasts → Climate-informed ecosystem & fisheries advice → Engagement & information sharing towards climate-smart decision making

2024 Climate Science Update

ALASKA'S MARINE ECOSYSTEMS are undergoing climate-driven changes, including rising sea temperatures, shrinking sea ice, & shifts in ocean acidification & productivity, impacting species from snow crab to whales. Impacts on **FISHERIES & FISHING COMMUNITIES** have been widespread affecting economies, livelihoods, family structures, mental health, sharing networks, & food security. Future projections indicate further changes in species distributions, stock abundances, and ecosystem dynamics, requiring climate planning & adaptive, flexible, & ecosystem-based strategies.

CLIMATE IMPACTS: *2024 spotlight on the EBS*

TEMPERATURE RISE: SSTs in the Eastern Bering Sea have risen by 1.0°C to 1.5°C, with a further increase of 1.5°C to 3.0°C expected by century's end. **SEA ICE DECLINE:** Arctic sea ice has declined precipitously over the observed record from 1978 to present. Eastern Bering Sea ice has remained stable, but experienced unprecedented lows in this region in 2018 and 2019 that have been attributed to human-caused climate change. **OCEAN ACIDIFICATION:** Global ocean surface pH has dropped by 0.1 units since 1750, with a further decline of 0.1 - 0.3 projected for the Bering Sea by the end of the century.

PACIFIC COD: Marine Heatwaves (MHW) were associated with a rapid redistribution of roughly half of Pacific cod biomass into the N. Bering Sea (NBS) in 2018 - 2019 as well as declines in biomass and recruitment. Future warming may push Pacific cod further north, expanding spawning habitat but potentially altering NBS carrying capacity. **SNOW CRAB** have also collapsed in response to marine heatwaves, & future warming is expected to further amplify impacts. Several WESTERN ALASKA **SALMON** stocks have declined in recent years, potentially linked to climate change, though impacts across across freshwater & marine life histories are complex. In contrast, Bristol Bay **SOCKEYE SALMON** & **SABLEFISH** have had increased abundance under warming conditions. The exact reasons for these divergent responses across species and stocks are still being evaluated.

CEFI: The Climate, Ecosystems, & Fisheries Initiative is a **cross-NOAA** effort to build the to build ocean modeling capacity & provide science support needed to allow management & resource users to adapt to changing ocean conditions. CEFI aims to provide: (1) **Robust forecasts** , decadal predictions, and long-term projections of ocean conditions; (2) **Publicly available** climate-linked early warnings, climate-enhanced stock, ecosystem, & risk assessments, & evaluations of climate-robust management response; (3) Increased capacity to provide **climate- informed advice** to support long-term sustainability & resilience.

NOAA FISHERIES — Alaska Fisheries Science Center

What we are planning & what we will do

Oceanographic

Region-specific oceanographic products will be developed for public use to support climate change adaptation. This includes the current Bering10K Regional Ocean Modeling System (ROMS) and the advanced Modular Ocean Model 6 (MOM6). These high resolution, three dimensional ocean models effectively simulate past ocean conditions and lower trophic level dynamics, from phytoplankton to krill, and are instrumental in forecasting future changes.

Hindcasts: hindcasts are a powerful tool for reconstructing the climate and environmental conditions of the recent past. Through CEFI, hincasts will be produced to recreate the oceanic and sea ice states over the past several decades. The ACT will evaluate the accuracy of these reconstructions by comparing them with historical ocean observations. Once validated, these model outputs will provide continuous data on ocean conditions from seabed to the surface. This information will enhance understanding of the ocean dynamics during different fishing and harvest seasons, and will help identify the drivers of species population changes, spatial shifts, and broader ecosystem responses to warming and marine heatwaves.

Forecasts: Forecasts from the same models will be updated each season to provide neartern projections of ocean conditions one to twelve months out.

Decadal predictions will provide data-driven outlook of potential ocean conditions up to 10 years into the future.

Long-term projections under high and low warming scenarios will deliver detailed information to support risk analyses and climate adaptation planning.

Climate-integrated models

habitat | survival | Distribution models

What we are planning & what we will do

Social & Economic

Develop **social hindcast methodology** with pilot of community responses to climate-induced changes in Alaska fisheries (2018-2023) to better understand community adaptation strategies.

Identify possible **social indicators** using existing data sources to detect and monitor the effects of climate-induced changes associated with resilience and vulnerability of Alaska fishing communities.

Support development of **publicly accessible, collaborative tools** allowing communities to view CEFI information products on climate-induced shifts in species distributions and ecological and oceanographic conditions.

Explore **pathways and examine barriers** for utilizing social and economic information to inform Council decision-making on climate resilient fisheries management.

Angela Abolhassani, angela.abolhassani@noaa.gov
Sarah Wise, sarah.wise@noaa.gov

Collaboratively identify drivers of Yukon River Chinook salmon marine survival using ROMS ocean temperature outputs, wind hindcasts, and Traditional Knowledge in partnership with the Yukon River Drainage Fisheries Association.

Ellen Yasumiishi, ellen.yasumiishi@noaa.gov
Sarah Wise, sarah.wise@noaa.gov

Species, stock & ecosystem status | Status | non-$ value | Economic value | Climate-informed advice | climate-informed forecasts & projections | Adaptation support

Council Coordination

In coordination with the Council points of contact, develop a process for **regular reporting of climate change impacts and responses to the Council** through existing pathways (or "on-ramps"). Fisheries Initiative (CEFI) potential projects and outputs could also help support the Council's climate readiness planning. This information will highlight current and proposed synergies between CEFI products and Council planning. Coordination on the development of these products will involve collaboration among the Council, NOAA's Alaska CEFI team (ACT) and partners, and the Alaska Fisheries Information Network.

Facilitate Council planning for climate change impacts on fisheries and fishing communities in Alaska through iterative discussions, workshops, information reporting, and synthesis of medium to long-term impacts on Alaska marine ecosystems. Support management strategy evaluations (MSEs) to evaluate the performance of alternative management measures and assessments under future climate scenarios.

Annual climate-informed advice: Develop interactive and publicly accessible resources for decision making and exploring tradeoffs in annual fisheries management decisions. Support climate-informed biological reference points and harvest control rules.

Rapid response: Support the development and delivery of tools to aid in-season management and navigate emergent climate challenges.

Strategic planning & response | Climate adaptation planning & response | spatial management | climate- smart targets

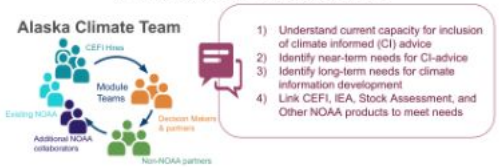
What is the ACT?

The ACT is the Alaska CEFI Regional Decision Support Team. The Alaska Climate CEFI Team (ACT), established in fall 2021, and expanding to include new members and partner liaisons in 2024, guides regional development of publicly accessible CEFI tools and products to support climate-informed advice and adaptation planning.

Regional Decision Support Teams

Regional Decision Support Teams produce climate-related information and advice for effective management of fisheries, ecosystems, and protected species and industry, and community adaptation planning. They operate through NOAA's Regional Fisheries Science Centers to provide:

- Early warnings and projections of ecosystem conditions
- Risk assessments & scenario planning for fisheries and fishing communities
- Science support for climate-ready Ecosystem-Based Management



How will CEFI change advice?

Scientists from the Alaska Fisheries Science Center have been leading pilot projects such as the Alaska Climate Integrated Modeling project (ACLIM) and the Gulf of Alaska Integrated Modeling project (GOACLIM). These projects serve as prototypes for the decision support tools and advice that CEFI may support. They demonstrate improved model performance with climate linkages and provide integrated climate advice that considers climate changes, biological and ecosystem responses, and alternative management and adaptation options to support climate-smart Ecosystem-Based Management and thriving climate-resilient communities in Alaska. Advice is designed to provide climate information via the existing Council process and advice pathways.

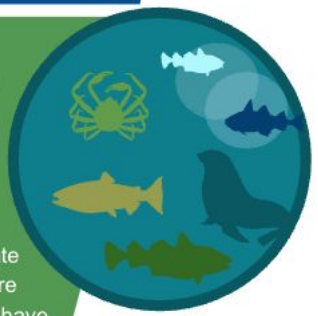
2024 Climate Science Update

ALASKA'S MARINE ECOSYSTEMS are undergoing climate-driven changes, including rising sea temperatures, shrinking sea ice, & shifts in ocean acidification & productivity, impacting species from snow crab to whales. Impacts on **FISHERIES & FISHING COMMUNITIES** have been widespread affecting economies, livelihoods, family structures, mental health, sharing networks, & food security. Future projections indicate further changes in species distributions, stock abundances, and ecosystem dynamics, requiring climate planning & adaptive, flexible, & ecosystem-based strategies.

CLIMATE IMPACTS: *2024 spotlight on the EBS*

TEMPERATURE RISE: SSTs in the Eastern Bering Sea have risen by 1.0°C to 1.5°C, with a further increase of 1.5°C to 3.0°C expected by century's end. **SEA ICE DECLINE:** Arctic sea ice has declined precipitously over the observed record from 1978 to present. Eastern Bering Sea ice has remained stable, but experienced unprecedented lows in this region in 2018 and 2019 that have been attributed to human-caused climate change. **OCEAN ACIDIFICATION:** Global ocean surface pH has dropped by 0.1 units since 1750, with a further decline of 0.1 - 0.3 projected for the Bering Sea by the end of the century.



PACIFIC COD: Marine Heatwaves (MHW) were associated with a rapid redistribution of roughly half of Pacific cod biomass into the N. Bering Sea (NBS) in 2018 - 2019 as well as declines in biomass and recruitment. Future warming may push Pacific cod further north, expanding spawning habitat but potentially altering NBS carrying capacity. **SNOW CRAB** have also collapsed in response to marine heatwaves, & future warming is expected to further amplify impacts. Several WESTERN ALASKA **SALMON** stocks have declined in recent years, potentially linked to climate change, though impacts across across freshwater & marine life histories are complex. In contrast, Bristol Bay **SOCKEYE SALMON** & **SABLEFISH** have had increased abundance under warming conditions. The exact reasons for these divergent responses across species and stocks are still being evaluated.

CEFI: The Climate, Ecosystems, & Fisheries Initiative is a **cross-NOAA** effort to build the to build ocean modeling capacity & provide science support needed to allow management & resource users to adapt to changing ocean conditions. CEFI aims to provide: (1) **Robust forecasts** , decadal predictions, and long-term projections of ocean conditions; (2) **Publicly available** climate-linked early warnings, climate-enhanced stock, ecosystem, & risk assessments, & evaluations of climate-robust management response; (3) Increased capacity to provide **climate- informed advice** to support long-term sustainability & resilience.

NOAA FISHERIES

Alaska Fisheries Science Center

What we are planning & what we will do

Oceanographic

Region-specific oceanographic products will be developed for public use to support climate change adaptation. This includes the current Bering10K Regional Ocean Modeling System (ROMS) and the advanced Modular Ocean Model 6 (MOM6). These high resolution, three dimensional ocean models effectively simulate past ocean conditions and lower trophic level dynamics, from phytoplankton to krill, and are instrumental in forecasting future changes.

Hindcasts: hindcasts are a powerful tool for reconstructing the climate and environmental conditions of the recent past. Through CEFI, hincasts will be produced to recreate the oceanic and sea ice states over the past several decades. The ACT will evaluate the accuracy of these reconstructions by comparing them with historical ocean observations. Once validated, these model outputs will provide continuous data on ocean conditions from seabed to the surface. This information will enhance understanding of the ocean dynamics during different fishing and harvest seasons, and will help identify the drivers of species population changes, spatial shifts, and broader ecosystem responses to warming and marine heatwaves.

Forecasts: Forecasts from the same models will be updated each season to provide neartem projections of ocean conditions one to twelve months out.

Decadal predictions will provide data-driven outlook of potential ocean conditions up to 10 years into the future.

Long-term projections under high and low warming scenarios will deliver detailed information to support risk analyses and climate adaptation planning.

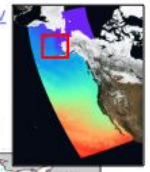
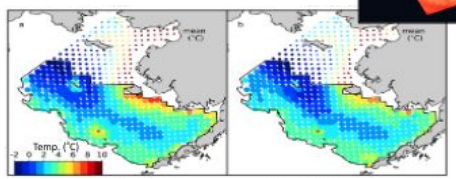
Wei Cheng, wei.cheng@noaa.gov



MOM6 Bering Sea Cold Pool



Model NMFS trawl survey

Biological

Develop dynamic climate-informed **multispecies distribution models** for Bering Sea groundfish, crab, and marine mammal species.

Assess **changes in spatial overlap** among species based on range projections under various climate scenarios.

Elizabeth McHuron, liz.mchuron@noaa.gov
Maurice Goodman, goodmm2@uw.edu

Link models and use ensemble approaches to quantify relationships between climate-ecosystem variables and **population dynamics** across fish species.

Identify best practices for selecting which climate-ecosystem variables can help predict stock dynamics.

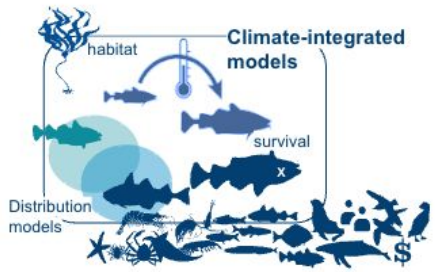
Jennifer Bigman, jennifer.bigman@noaa.gov
Grant Adams, grant.adams@noaa.gov
André Punt, aepunt@uw.edu

Develop **climate-linked harvest control rules** to determine ABC buffers for the North Pacific Fisheries Management Council.

Develop software to produce climate-informed short-term **growth and mortality forecasts** for NPFMC harvest control rules.

Support **climate-informed stock assessments and multispecies models** for groundfish in the Gulf of Alaska and Bering Sea.

Grant Adams, grant.adams@noaa.gov
Kirstin Holsman, kirstin.holsman@noaa.gov
André Punt, aepunt@uw.edu



What we are planning & what we will do

Social & Economic

Develop **social hindcast methodology** with pilot of community responses to climate-induced changes in Alaska fisheries (2018-2023) to better understand community adaptation strategies.

Identify possible **social indicators** using existing data sources to detect and monitor the effects of climate-induced changes associated with resilience and vulnerability of Alaska fishing communities.

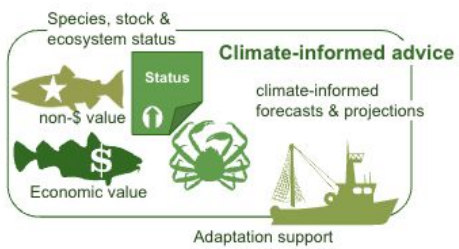
Support development of **publicly accessible, collaborative tools** allowing communities to view CEFI information products on climate-induced shifts in species distributions and ecological and oceanographic conditions.

Explore **pathways and examine barriers** for utilizing social and economic information to inform Council decision-making on climate resilient fisheries management.

Angela Abolhassani, angela.abolhassani@noaa.gov
Sarah Wise, sarah.wise@noaa.gov

Collaboratively identify drivers of Yukon River Chinook salmon marine survival using ROMS ocean temperature outputs, wind hindcasts, and Traditional Knowledge in partnership with the Yukon River Drainage Fisheries Association.

Ellen Yasumiishi, ellen.yasumiishi@noaa.gov
Sarah Wise, sarah.wise@noaa.gov



Council Coordination

In coordination with the Council points of contact, develop a process for **regular reporting of climate change impacts and responses to the Council** through existing pathways (or "on-ramps"). Fisheries Initiative (CEFI) potential projects and outputs could also help support the Council's climate readiness planning. This information will highlight current and proposed synergies between CEFI products and Council planning. Coordination on the development of these products will involve collaboration among the Council, NOAA's Alaska CEFI team (ACT) and partners, and the Alaska Fisheries Information Network.

Facilitate Council planning for climate change impacts on fisheries and fishing communities in Alaska through iterative discussions, workshops, information reporting, and synthesis of medium to long-term impacts on Alaska marine ecosystems. Support management strategy evaluations (MSEs) to evaluate the performance of alternative management measures and assessments under future climate scenarios.

Annual climate-informed advice: Develop interactive and publicly accessible resources for decision making and exploring tradeoffs in annual fisheries management decisions. Support climate-informed biological reference points and harvest control rules.

Rapid response: Support the development and delivery of tools to aid in-season management and navigate emergent climate challenges.

Angela Abolhassani, angela.abolhassani@noaa.gov

Climate change is challenging but solvable

Overall, the latest studies on the net economic implications of decarbonisation – which also account for avoided climate damages – **point to overall benefit from the transition.**
-Prof Valentina Bosetti

If people are provided with opportunities to make choices supported by policies, infrastructure and technologies, there is an untapped mitigation potential to **bring down global emissions by between 40 and 70% by 2050** compared to a baseline scenario.

-Prof Joyashree Roy

The evidence is clear: there are now mitigation options available in all sectors that could together **halve global greenhouse gas emissions by 2030.** *-Dr Céline Guivarch*
