# B REPORT – BYCATCH REPORT

MICHAEL FEY 02/05/26

# BYCATCH REPORT - OVERVIEW

- During the December meeting, the Council requested that staff provide updated bycatch information based on the findings of the Witherell/Fey 2023 paper. This update utilizes the National Bycatch Report Dataset 2026 compiled by AKFIN.
- The *National Bycatch Report* is a national-level compilation of bycatch estimates for U.S. commercial fisheries, produced by the National Marine Fisheries Service. The report documents how much bycatch is occurring across the nation's fisheries.
  - Bycatch is defined in the report as discard of any living marine resource plus any mortality caused by gear interactions
  - The report was published in 2011, 2014, 2016 and 2019
  - NMFS is working towards a modernized database with application for bycatch analysis
- Alaska bycatch data annually compiled by AKFIN and submitted to NMFS for *National Bycatch Report*
  - Groundfish and halibut fisheries
  - All data is in weights - PSC converted to weight
  - Halibut in tons - does not align with standard practice in Alaska

# BYCATCH REPORT - OVERVIEW

- Council staff developed new fisheries grouping in 2022 to consolidate the fishery groupings
  - Trawl grouped into Atka mackerel/rockfish, Pacific cod, pollock, and flatfish
  - Longline grouped into Pacific cod longline, halibut longline and sablefish longline
  - Pot grouped into Pacific cod pot, halibut pot and sablefish pot
- Council staff published a paper with the new groupings and bycatch rates (Witherell/Fey 2023)
  - [Fish Bycatch in the North Pacific Halibut, Hippoglossus Stenolepis, and Groundfish Fisheries](#)
  - Paper concludes Alaska has low bycatch rates compared to National average (4.7% versus ~11% in 2021)
- Tables 3-7 from Witherell/Fey 2023 paper updated in this presentation
  - Potential for future annual reporting
  - Halibut in mortality – aligns with standard management practice in Alaska
- Additional tables provided to show historic bycatch rates for longer term comparison
