

Climate update

Dec 2024

Kirstin Holsman

NOAA Alaska Fisheries Science Center

kirstin.holsman@noaa.gov

Today's talk

Part 1: Climate challenges continue to grow, with uncertainty about future trajectories

Part 2: Climate-informed tools are available to support future sustainable fisheries (ACLIM)

Part 3: CEFI accelerates the capacity to deliver climate-informed tools and advice

1 Climate challenges continue to grow, with uncertainty about future trajectories

Greenhouse gases reached record observed levels in 2023.

Real time data indicate that they continued to rise in 2024.

Figure 1: Annual global mean temperature anomalies (relative to 1850–1900) from 1850 to 2024 from six datasets. The 2024 average is based on data from January-September.

January-September 2024 was 1.54±0.13°C above the pre-industrial average.

Greenhouse gases reached record observed levels in 2023.

Real time data indicate that they continued to rise in 2024.

- CO₂

420.0 ppm ± 0.2

151% of pre-industrial levels
- CH₄

1934 ppb ± 2

265% of pre-industrial levels.
- N₂O

336.9 ppb ± 0.1

124% of pre-industrial levels

2.0 C of Warming : Critical Tipping point

Figure 1: Annual global mean temperature anomalies (relative to 1850–1900) from 1850 to 2024 from six datasets. The 2024 average is based on data from January–September.

January-September 2024 was 1.54±0.13°C above the pre-industrial average.

Climate change is expected to continue to impact AK Ecosystems & Fisheries

a) Global surface temperature change relative to 1850-1900

Warming will continue and is greater in scenarios with **low CO₂ mitigation and higher warming**

b) September Arctic sea ice area

Sea Ice will continue to decline, more so under scenarios with **high global warming and low CO₂ mitigation**

Figures from the IPCC AR6 WGI Summary for Policymakers:
https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC_AR6_WGI_SPM.pdf

UNFCCC 2024 Nationally Determined Contributions (NDCs) Synthesis report

PARIS CLIMATE AGREEMENT

1.  $<2^{\circ}\text{C}$

 NET ZERO EMISSIONS
 Limit the avg. global temperature increase to $< 2^{\circ}$ centigrade + achieve net zero emissions by mid-century

2. 
 Enhance resilience and adaptation to climate impacts certain to occur

3. 
 Align financial flows in the world with these objectives

ACLIM found fisheries have higher risk above this (SSP585, RCP8.5)

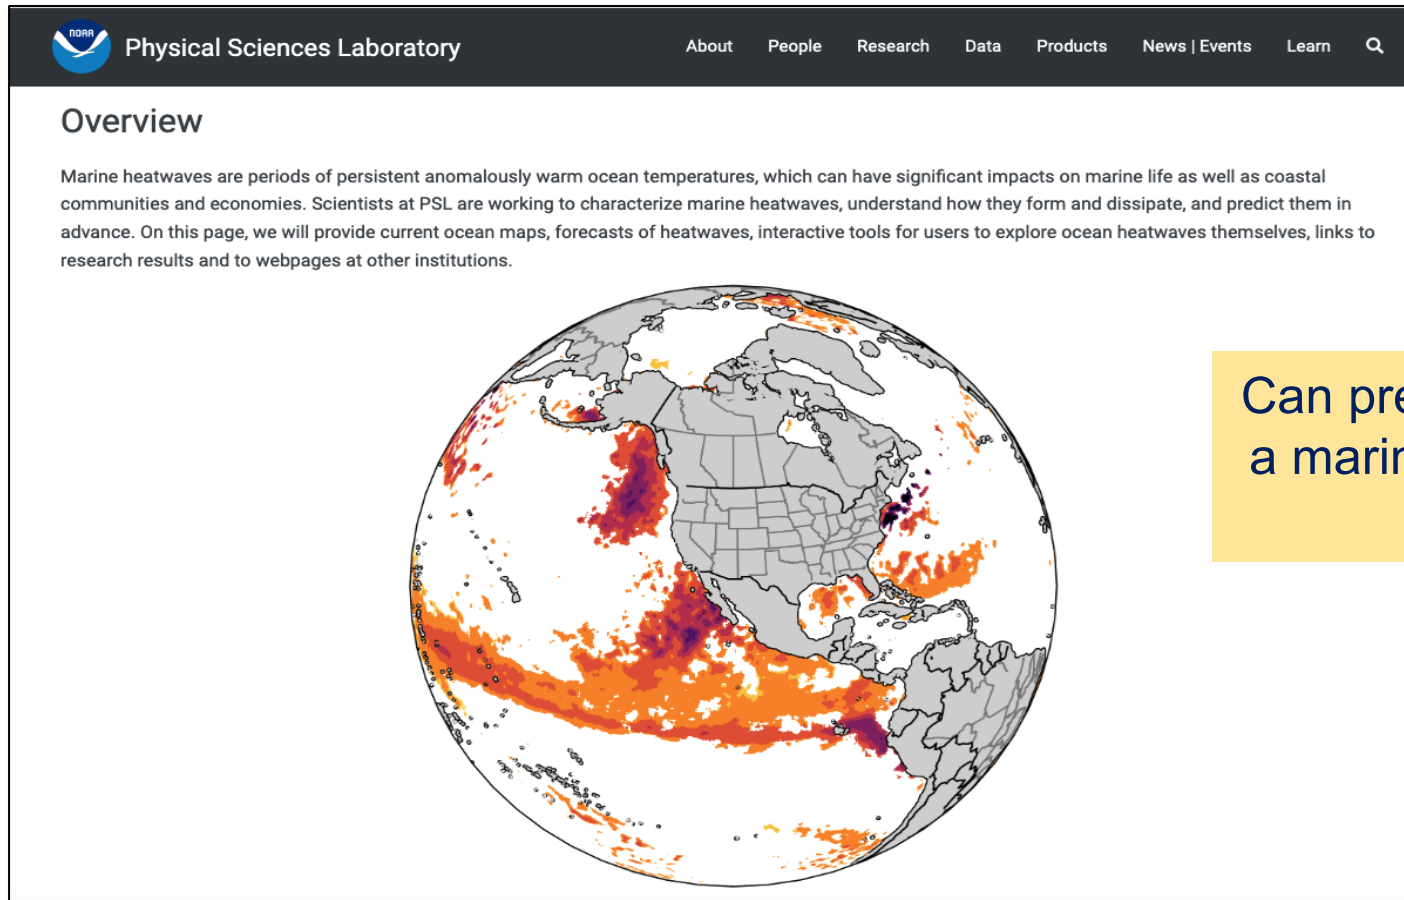

ACLIM found fisheries have lower risk in this scenario (SSP126)

2 Climate-informed tools are available to support future sustainable fisheries

New predictive tools can help fisheries prepare & plan

psl.noaa.gov/marine-heatwaves

The screenshot shows the NOAA Physical Sciences Laboratory website. The header includes the NOAA logo, the text "Physical Sciences Laboratory", and navigation links for "About", "People", "Research", "Data", "Products", "News | Events", "Learn", and a search icon. The main content area is titled "Overview" and contains a paragraph: "Marine heatwaves are periods of persistent anomalously warm ocean temperatures, which can have significant impacts on marine life as well as coastal communities and economies. Scientists at PSL are working to characterize marine heatwaves, understand how they form and dissipate, and predict them in advance. On this page, we will provide current ocean maps, forecasts of heatwaves, interactive tools for users to explore ocean heatwaves themselves, links to research results and to webpages at other institutions." Below the text is a globe showing ocean temperature anomalies, with significant areas of red and orange indicating warm events, particularly in the North Pacific and North Atlantic.

Can predict the probability of a marine heatwave 1-12 mo ahead of time

Climate “on ramps” through the Council process

Climate informed annual* stock and ecosystem assessments & EBFM advice

Climate information in near-term ecosystem based management targets

Climate-ready Ecosystem Based Fisheries Management planning, information & design

KEY: Matching climate information & projections to the scale of decision making & advice

On-ramp 1

Tactical Near-term Advice (<2 yr)

Climate change information incorporated into stock assessment models, stock-specific indicators (ESPs), stock-specific risk tables (as appropriate).

E.g., ABC based on climate forecasts

On-ramp 2

Strategic Near-term Advice (<2 yr)

Climate change context for observed changes in social, ecological, & oceanographic conditions relevant for harvest advice and targets.

E.g., Forecasts of climate-driven distributions, tipping points, & thresholds

On-ramp 3 (new)

Strategic & Long-term Advice (>2 yr)

Climate - informed long-term strategic decision making & planning informed by IK, LK, and climate & management scenario evaluations, risk assessments, & adaptation efficacy & feasibility evaluations.

E.g., Targets based on climate projections

Legend

- Existing tools or process
- Help ID climate change gaps
- New tools or process

AFSC Integrated Climate Modeling Projects

The Alaska Climate Integrated Modeling Project

Goal: To address climate information needs with best available science & tools

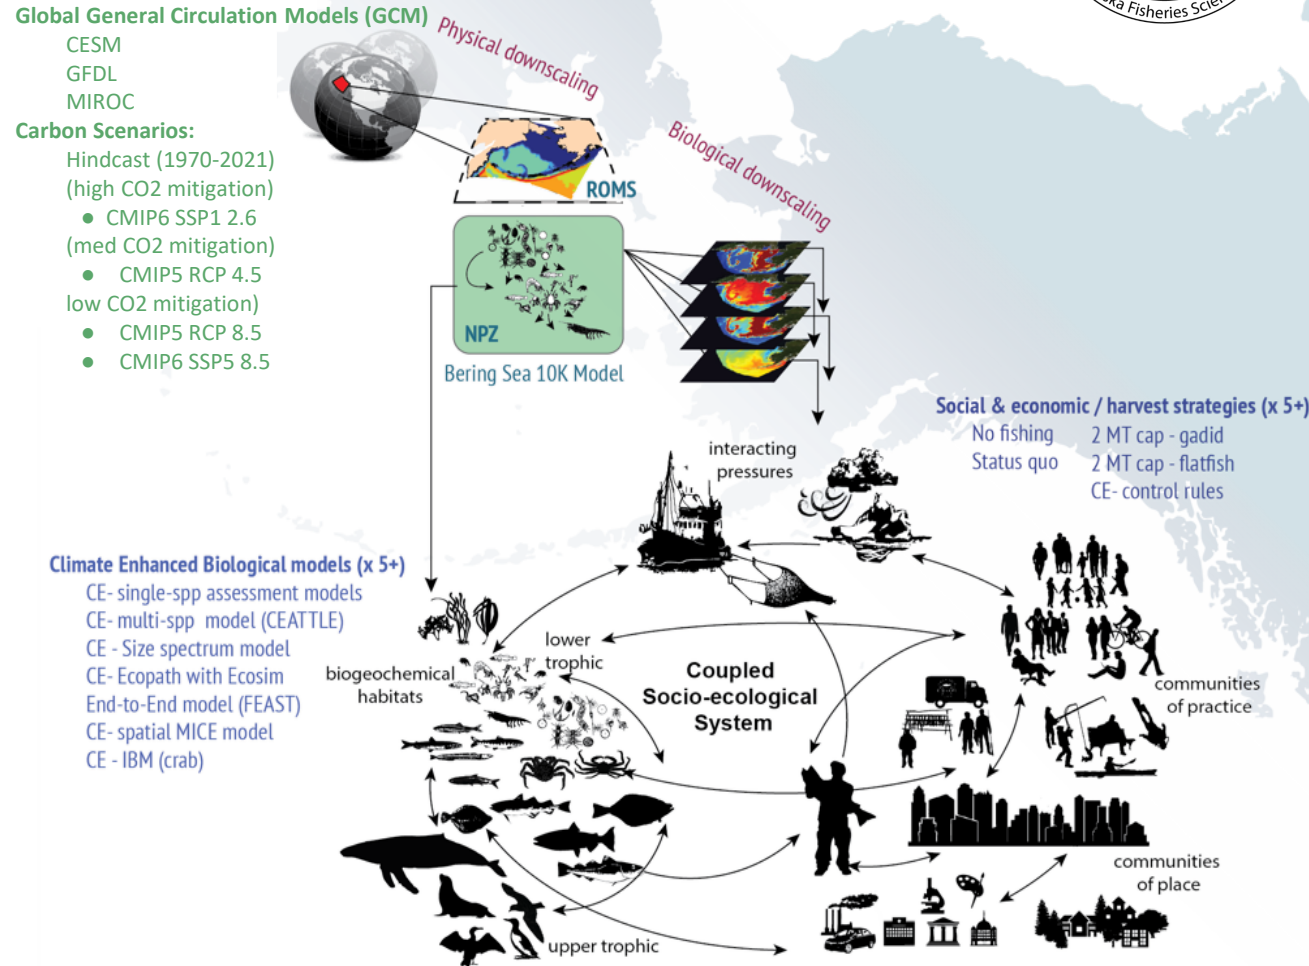

What to expect?

- Project physical and ecological conditions under levels of climate change (levels of global carbon mitigation)
- Characterize uncertainty

What can be done?

- Evaluate effectiveness of adaptation actions including those supported by fisheries management

Scenarios form the basis for comparative simulations & Management Strategy Evaluations

The Alaska Climate Integrated Modeling (ACLIM) project represents a comprehensive, multi-year, interdisciplinary effort to characterize and project climate-driven changes to the eastern Bering Sea (EBS) ecosystem, from physics to fishing communities. Results from the ACLIM project are being used to understand how different regional fisheries management approaches can help promote adaptation to climate-driven changes to sustain fish and shellfish populations and to inform managers and fishery dependent communities of the risks associated with different future climate scenarios. The project relies on iterative communications and outreaches with managers and fishery-dependent communities that have informed the selection of fishing scenarios. This iterative approach ensures that the research team focuses on policy relevant scenarios that explore realistic adaptation options for managers and communities. Within each iterative cycle, the interdisciplinary research team continues to improve: methods for downscaling climate models, climate-enhanced biological models, socio-economic modeling, and management strategy evaluation (MSE) within a common analytical framework. The evolving nature of the ACLIM framework ensures improved understanding of system responses and feedbacks are considered within the projections and that the fishing scenarios continue to reflect the management objectives of the regional fisheries management bodies. The multi-model approach used for projection of biological responses, facilitates the quantification of the relative contributions of climate forcing scenario, fishing scenario, parameter, and structural uncertainty within and between models. Ensemble means and variance within and between models inform risk assessments under different future scenarios. The first phase of projections of climate conditions to the end of the 21st century is complete,

Hollowed et al. 2020 ACLIM overview paper

Key Takeaways from ACLIM to date

Climate Informed EBM advice

Climate impacts ecosystems & food webs

Climate impacts on growth, survival & biomass

Changes to fish distributions (& fishing grounds)

Climate change (oceanography)

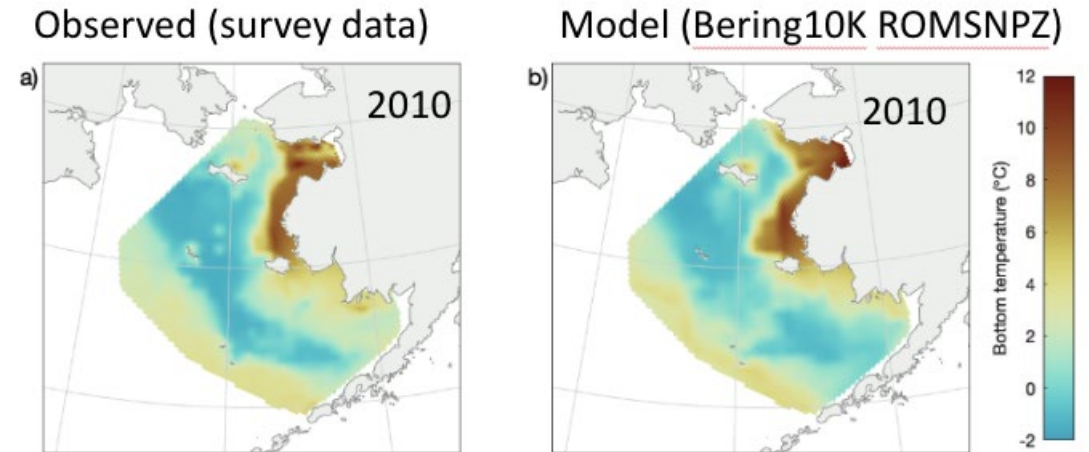

1. Need to account for ecosystem-wide productivity changes
2. Manage predator-prey Interactions using new approaches
3. Need to (and can) adapt to climate-driven species range shifts
4. Expand Ecosystem-Based Fisheries Management through coordination and collaboration
5. Address uncertainty with ensembles and participatory scenario planning
6. Incorporate socio-economic resilience into planning and response
7. Strengthen research and monitoring infrastructure

Key Outcomes of ACLIM to date

1. **Provided baseline engineering capacity for ocean and ecosystems predictions and forecasts**
2. Identified key couplings, and gaps and needs in linked climate- oceanographic- biological- social-economic models
3. Evaluated trajectories under future scenarios, alternative management strategies, alternative harvest control rules → emergent understanding of common pitfalls and best practices
4. Sustained community of practice for climate-informed advice, including support for partnership building around adaptation planning

High-res model reproduces the Bering Sea environment

Adapting reference points to reflect changes in productivity

- MSA directs reference points to reflect current and probable future environmental conditions
- Changing reference points for stocks undergoing climate-related productivity shifts can result in counter-intuitive management actions:
 - Declining stocks could be fished harder
 - Flourishing stocks could be fished more conservatively

Szuwalski et al. 2023

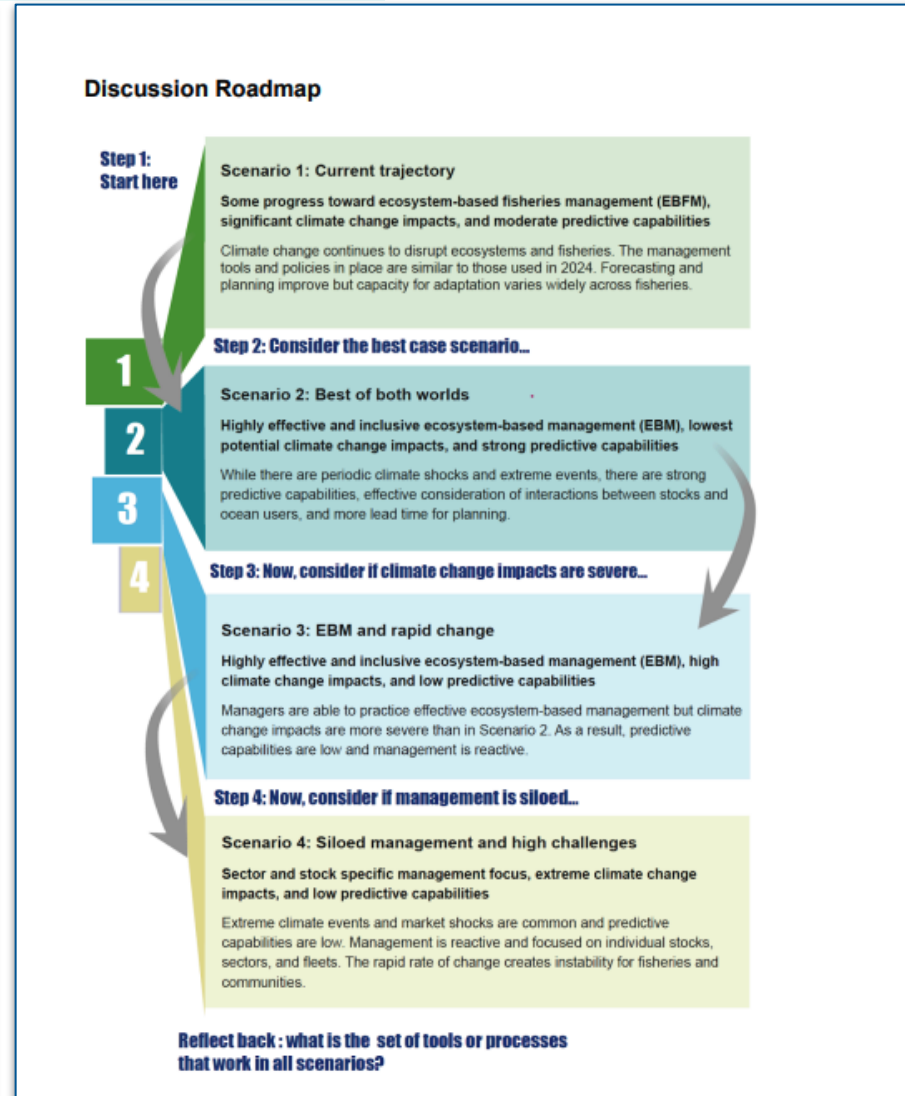

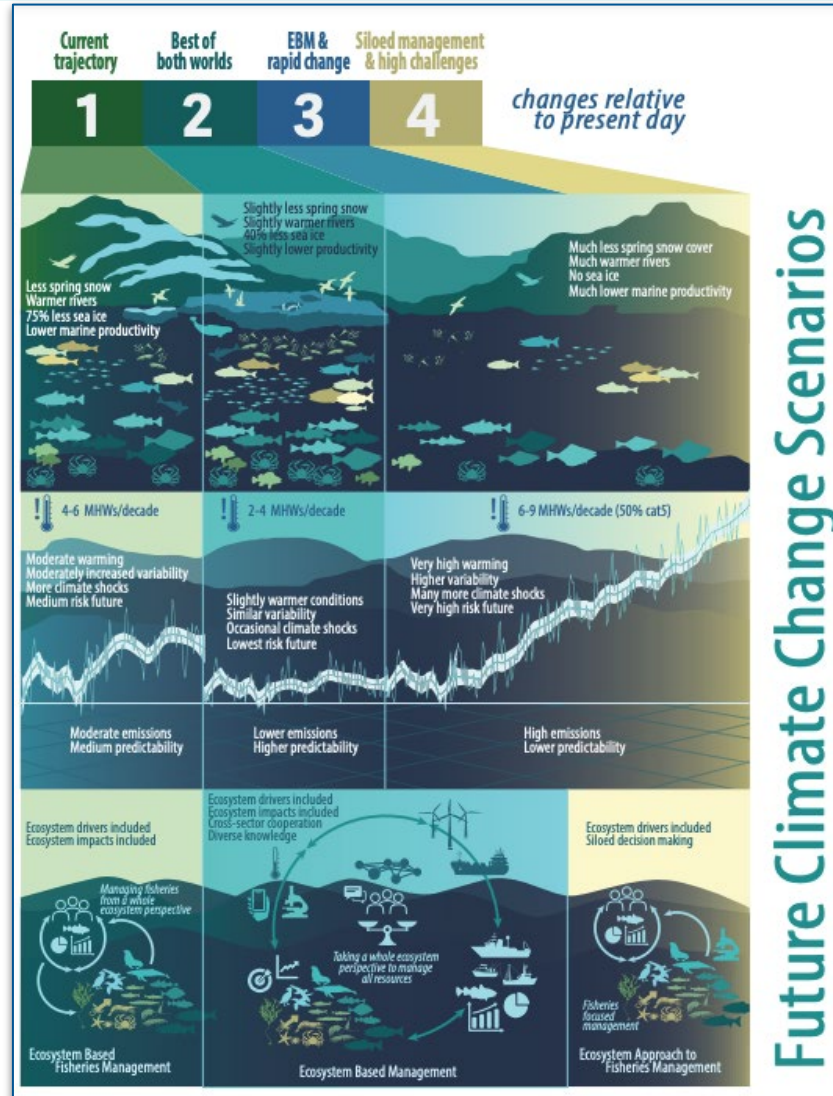

A) Biological reference points

ACLIM2 SDMs: Species range and overlap forecasts

Species 1: arrowtooth flounder
Species 2: walleye pollock
Species 1 size bin: adult
Species 2 size bin: juvenile

Compute overlap indices using: Estimated biomass, Probability of occurrence

Climate scenarios: SSP1-2.6 (CMIP6), RCP 4.5 (CMIP5), SSP5-8.5 (CMIP6)

Climate models: Ensemble, CESM, GFDL, MIROC

Download output: Overlap, Species 1, Species 2

Background
This interface displays fitted means and confidence intervals from SDMs built for a suite of eastern Bering Sea groundfish and crab species as part of the ACLIM2 project. Generalized additive models (GAMs) were built for each species with environmental covariates selected using time-series cross validation (i.e., by optimizing several-year-ahead predictive performance). Terms considered in the models include temperature, depth, oxygen, pH, and spatially-varying effects of the cold pool. Models were fit separately for juveniles and adults for most species, but not for snow crabs, and red king crab - when plotting these species, choose 'all' for the size bin. Models were fit as delta-GAMs, with a binomial component for estimating probability of occurrence, and lognormal component for estimating positive (non-zero) biomass. Overlap projections are plotted below, with model summaries and range projections for individual species available in tabs to the right.

Spatial overlap
Each of the below overlap metrics varies between 0 and 1, with 0 indicating no overlap and 1 indicating complete overlap, and each is invariant under linear transformation, i.e., impacted only by the relative biomass distributions of each species, not by the aggregate sum biomass in a given year. The years containing groundfish survey data (1982-2019) are shaded.

Local index of collocation
$$\frac{\sum p_x p_y}{\sum p_x^2 \sum p_y^2}$$

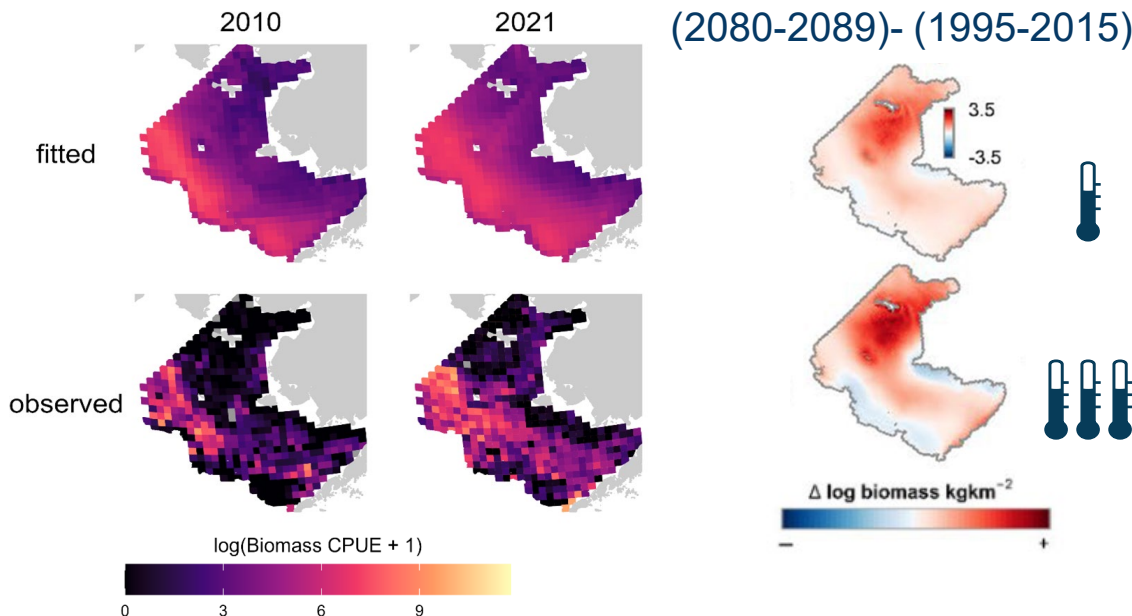

The local index of collocation is (loosely) a relative metric of interspecies encounter, which measures co-occurrence as a non-centered correlation among estimated species biomass:

NOAA Climate, Ecosystems, & Fisheries Initiative

Decision Support Teams

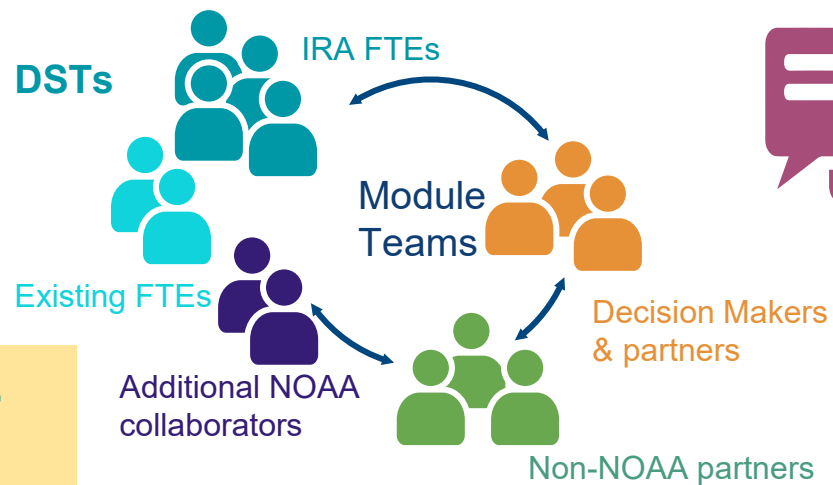

Co-generate regionally, locally, and community tailored tools & advice

What are Decision Support Teams?

Transdisciplinary nested teams that will help deliver climate informed products and advice, specifically tailored to decision maker needs.

- 1) Understand current capacity for inclusion of climate informed advice
- 2) Identify near-term needs for CI-advice
- 3) Identify long-term needs for development
- 4) Link CEFI, IEA, Stock Assessment, and Other NOAA products to meet needs

Support and co-leverage

not repeat or re-invent

Decision Support Delivery Steps

2023 **Step 1: Engagement & Partnership Building**

Identify key partners and collaborators and begin or advance discussions around climate change planning and needs

2024 **Step 2: Co-identify on-ramps**

In coordination and collaboration with partners and decision makers, identify existing and needed climate specific decision support needs

2025 **Step 3: Co-identify needs & prioritize**

Co-identify needs and prioritize decision support information, needs, and products

2026 **Step 4: Design, build & TEST**

Match resources and tools to needs and test skill relative to co-identified metrics of performance

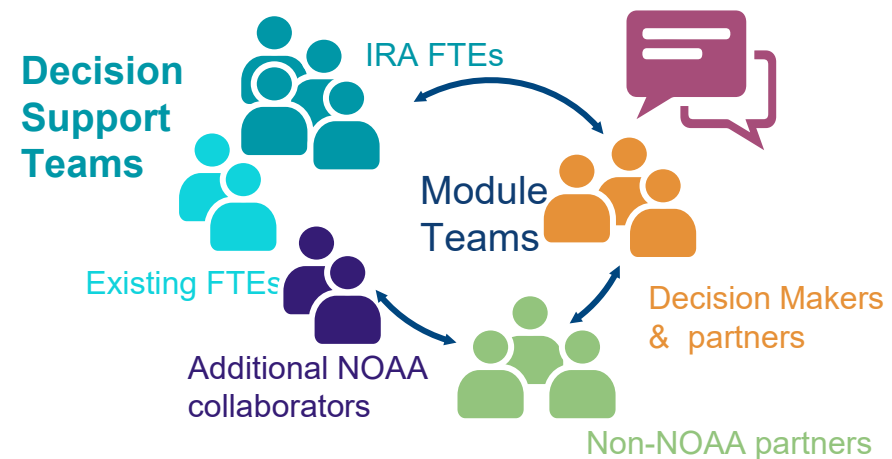

2027 **Step 5: Deliver & refine**

Deliver decision support tools and advice; iterate and refine products with feedback and engagement

MOM6

- Is there an existing tool/product that meets the need?
- Do the scales match advice?
- Does the output skillfully meet needs?

Types of Management Actions

Climate impacts ecosystems & food webs

Climate impacts on growth, survival & biomass

Changes to fish distributions (& fishing grounds)

Climate change (oceanography)

Climate Informed EBM advice

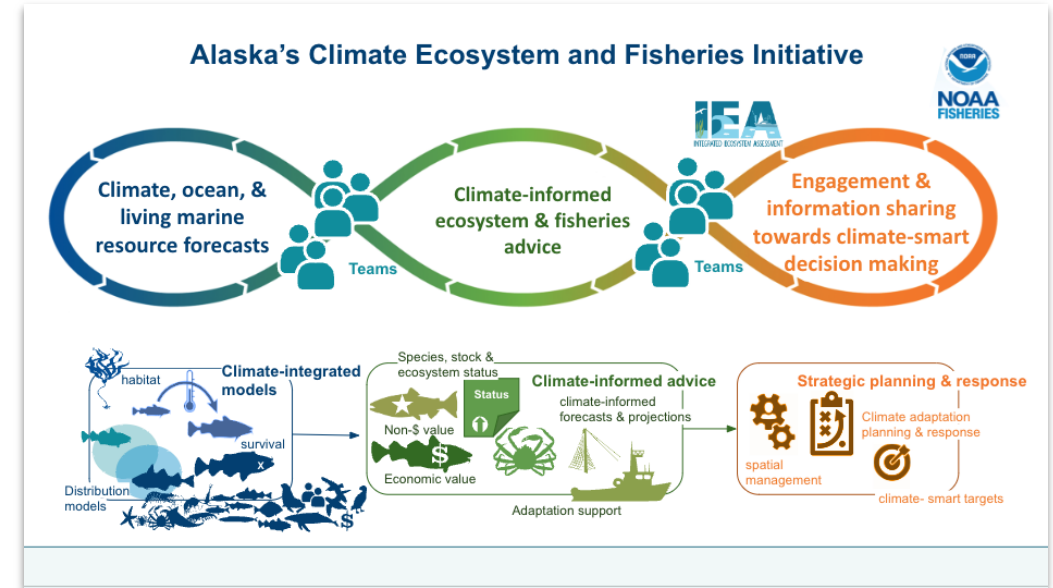

Draft Focal Areas for Alaska CEFI

FOCAL AREA 1: Web accessible and regionally tailored climate change products & trainings (cross cutting)

FOCAL AREA 2: Climate-integrated fisheries assessments and EBM tools

FOCAL AREA 3: Decision support for climate aware regulatory frameworks

FOCAL AREA 4: Climate resilience community planning and response

Provide via climate information on-ramps in ESPs, ESRs, Stock assessments, ACEPO, etc.

New this year: Prototype
Climate information overview

Feedback welcome!

2024 Climate Science Update

ALASKA'S MARINE ECOSYSTEMS are undergoing climate-driven changes, including rising sea temperatures, shrinking sea ice, & shifts in ocean acidification & productivity, impacting species from snow crab to whales. Impacts on **FISHERIES & FISHING COMMUNITIES** have been widespread affecting economies, livelihoods, family structures, mental health, sharing networks, & food security. Future projections indicate further changes in species distributions, stock abundances, and ecosystem dynamics, requiring climate planning & adaptive, flexible, & ecosystem-based strategies.

CLIMATE IMPACTS: 2024 spotlight on the EBS

TEMPERATURE RISE: SSTs in the Eastern Bering Sea have risen by 1.0°C to 1.5°C, with a further increase of 1.5°C to 3.0°C expected by century's end. **SEA ICE DECLINE:** Arctic sea ice has declined precipitously over the observed record from 1978 to present. Eastern Bering Sea ice has remained stable, but experienced unprecedented lows in this region in 2018 and 2019 that have been attributed to human-caused climate change. **OCEAN ACIDIFICATION:** Global ocean surface pH has dropped by 0.1 units since 1750, with a further decline of 0.1 - 0.3 projected for the Bering Sea by the end of the century.

PACIFIC COD: Marine Heatwaves (MHW) were associated with a rapid redistribution of roughly half of Pacific cod biomass into the N. Bering Sea (NBS) in 2018 - 2019 as well as declines in biomass and recruitment. Future warming may push Pacific cod further north, expanding spawning habitat but potentially altering NBS carrying capacity. **SNOW CRAB** have also collapsed in response to marine heatwaves, & future warming is expected to further amplify impacts. Several WESTERN ALASKA **SALMON** stocks have declined in recent years, potentially linked to climate change, though impacts across across freshwater & marine life histories are complex. In contrast, Bristol Bay **SOCKEYE SALMON** & **SABLEFISH** have had increased abundance under warming conditions. The exact reasons for these divergent responses across species and stocks are still being evaluated.

CEFI: The Climate, Ecosystems, & Fisheries Initiative is a **cross-NOAA** effort to build the to build ocean modeling capacity & provide science support needed to aid management & resource users to adapt to changing ocean conditions. CEFI aims to provide: (1) **Robust forecasts**, decadal predictions, and long-term projections of ocean conditions; (2) **Publicly available** climate-linked early warnings, climate-enhanced stock, ecosystem, & risk assessments, & evaluations of climate-robust management response; (3) increased capacity to provide **climate-informed advice** to support long-term sustainability & resilience.

Alaska's Climate, Ecosystems, and Fisheries Initiative

Climate, ocean, & living marine resource forecasts → Teams → Climate-informed ecosystem & fisheries advice → Engagement & information sharing towards climate-smart decision making

NOAA FISHERIES Alaska Fisheries Science Center

What we are planning & what we will do

Oceanographic

Region-specific oceanographic products will be developed for public use to support climate change adaptation. This includes the current Regional Ocean Modeling System (ROMS) and the advanced Modular Ocean Model 6 (MOM6). These high resolution, three dimensional ocean models effectively simulate past ocean conditions and lower trophic level dynamics, from phytoplankton to kill, and are instrumental in forecasting future changes.

Hindcasts: hindcasts are a powerful tool for reconstructing the climate and environmental conditions of the recent past. Through CEFI, hindcasts will be produced to recreate the oceanic and sea ice states over the past several decades. The ACT will evaluate the accuracy of these reconstructions by comparing them with historical ocean observations. Once validated, these model outputs will provide continuous data on ocean conditions from seabed to the surface. This information will enhance understanding of the ocean dynamics during different fishing and harvest seasons, and help identify the drivers of species population changes, spatial shifts, and broader ecosystem responses to warming and marine heatwaves.

Forecasts: Forecasts from the same models will be updated each season to provide near-term projections of ocean conditions one to twelve months out.

Decadal predictions will provide data-driven outlook of potential ocean conditions up to 10 years into the future.

Long-term projections under high and low warming scenarios will deliver detailed information to support risk analyses and climate adaptation planning.

Kelly Kearney, kelly.kearney@noaa.gov
Wei Cheng, wei.cheng@noaa.gov

Biological

Develop dynamic climate-informed multispecies distribution models for Bering Sea groundfish, crab, and marine mammal species.

Assess changes in spatial overlap among species based on range projections under various climate scenarios.

Elizabeth McHuron, elizabeth.mchuron@noaa.gov
Maurice Goodman, goodman@uw.edu

Link models and use ensemble approaches to quantify relationships between climate-ecosystem variables and population dynamics across fish species.

Identify best practices for selecting which climate-ecosystem variables can help predict stock dynamics.

Jennifer Bigman, jennifer.bigman@noaa.gov
Grant Adams, grant.adams@noaa.gov
André Punt, apunt@uw.edu

Develop climate-linked harvest control rules to determine ADC buffers for the North Pacific Fisheries Management Council.

Develop software to produce climate-informed short-term growth and mortality forecasts for NPFMC harvest control rules.

Support climate-informed stock assessments and multispecies models for groundfish in the Gulf of Alaska and Bering Sea.

Grant Adams, grant.adams@noaa.gov
Kirstin Holtsman, kirstin.holtsman@noaa.gov
André Punt, apunt@uw.edu

Social & Economic

Develop social hindcast methodology with pilot of community responses to climate-induced changes in Alaska fisheries (2018-2023) to better understand community adaptation strategies.

Identify possible social indicators using existing data sources to detect and monitor the effects of climate-induced changes associated with resilience and vulnerability of Alaska fishing communities.

Support development of publicly accessible, collaborative tools allowing communities to view CEFI information products on climate-induced shifts in species distributions and ecological and oceanographic conditions.

Explore pathways and examine barriers for utilizing social and economic information to inform Council decision-making on climate resilient fisheries management.

Angela Abolhasani, angela.abolhasani@noaa.gov
Sarah Wise, sarah.wise@noaa.gov

Collaboratively identify drivers of Yukon River Chinook salmon marine survival using ROMS ocean temperature outputs, wind hindcasts, and Traditional Knowledge in partnership with the Yukon River Drainage Fisheries Association.

Ellen Yasumishi, ellen.yasumishi@noaa.gov
Sarah Wise, sarah.wise@noaa.gov

Council Coordination

In coordination with the Council points of contact, develop a process for regular reporting of climate change impacts and responses to the Council through existing pathways (or "on-ramps"). Fisheries Initiative (CEFI) potential projects and outputs could also help support the Council's climate readiness planning. This information will highlight current and proposed synergies between CEFI products and Council planning. Coordination on the development of these products will involve collaboration among the Council, NOAA's Alaska CEFI team (ACT) and partners, and the Alaska Fisheries Information Network.

Facilitate Council planning for climate change impacts on fisheries and fishing communities in Alaska through iterative discussions, workshops, information reporting, and synthesis of medium to long-term impacts on Alaska marine ecosystems. Support management strategy evaluations (MSEs) to evaluate the performance of alternative management measures and assessments under future climate scenarios.

Annual climate-informed advice: Develop interactive and publicly accessible resources for decision making and exploring tradeoffs in annual fisheries management decisions. Support climate-informed biological reference points and harvest control rules.

Rapid response: Support the development and delivery of tools to aid in-season management and navigate emergent climate challenges.

Strategic planning & response

Climate adaptation planning & response
Spatial management
Climate-smart targets
Adaptation support

What is the ACT?

The ACT is the Alaska CEFI Regional Decision Support Team. The Alaska Climate CEFI Team (ACT), established in fall 2021, and expanding to include new members and partner liaisons in 2024, guides regional development of publicly accessible CEFI tools and products to support climate-informed advice and adaptation planning.

Regional Decision Support Teams

Regional Decision Support Teams produce climate-related information and advice for effective management of fisheries, ecosystems, and protected species and industry, and community adaptation planning. They operate through NOAA's Regional Fisheries Science Centers to provide:

- Early warnings and projections of ecosystem conditions
- Risk assessments & scenario planning for fisheries and fishing communities
- Science support for climate-ready Ecosystem-Based Management

How will CEFI change advice?

Scientists from the Alaska Fisheries Science Center have been leading pilot projects such as the Alaska Climate Integrated Modeling project (ACLIM) and the Gulf of Alaska Integrated Modeling project (GOACLIM). These projects serve as prototypes for the decision support tools and advice that CEFI may support. They demonstrate improved model performance with climate linkages and provide integrated climate advice that considers climate changes, biological and ecosystem responses, and alternative management and adaptation options to support climate-smart Ecosystem-Based Management and thriving climate-resilient communities in Alaska. Advice is designed to provide climate information via the existing Council process and advice pathways.

2024 Climate Science Update

ALASKA'S MARINE ECOSYSTEMS are undergoing climate-driven changes, including rising sea temperatures, shrinking sea ice, & shifts in ocean acidification & productivity, impacting species from snow crab to whales. Impacts on **FISHERIES & FISHING COMMUNITIES** have been widespread affecting economies, livelihoods, family structures, mental health, sharing networks, & food security. Future projections indicate further changes in species distributions, stock abundances, and ecosystem dynamics, requiring climate planning & adaptive, flexible, & ecosystem-based strategies.

CLIMATE IMPACTS: 2024 spotlight on the EBS

TEMPERATURE RISE: SSTs in the Eastern Bering Sea have risen by 1.0°C to 1.5°C, with a further increase of 1.5°C to 3.0°C expected by century's end. **SEA ICE DECLINE:** Arctic sea ice has declined precipitously over the observed record from 1978 to present. Eastern Bering Sea ice has remained stable, but experienced unprecedented lows in this region in 2018 and 2019 that have been attributed to human-caused climate change. **OCEAN ACIDIFICATION:** Global ocean surface pH has dropped by 0.1 units since 1750, with a further decline of 0.1 - 0.3 projected for the Bering Sea by the end of the century.

PACIFIC COD: Marine Heatwaves (MHW) were associated with a rapid redistribution of roughly half of Pacific cod biomass into the N. Bering Sea (NBS) in 2018 - 2019 as well as declines in biomass and recruitment. Future warming may push Pacific cod further north, expanding spawning habitat but potentially altering NBS carrying capacity. **SNOW CRAB** have also collapsed in response to marine heatwaves, & future warming is expected to further amplify impacts. Several **WESTERN ALASKA SALMON** stocks have declined in recent years, potentially linked to climate change, though impacts across across freshwater & marine life histories are complex. In contrast, Bristol Bay **SOCKEYE SALMON & SABLEFISH** have had increased abundance under warming conditions. The exact reasons for these divergent responses across species and stocks are still being evaluated.

CEFI: The Climate, Ecosystems, & Fisheries Initiative is a **cross-NOAA** effort to build the to build ocean modeling capacity & provide science support needed to allow management & resource users to adapt to changing ocean conditions. CEFI aims to provide: (1) **Robust forecasts**, decadal predictions, and long-term projections of ocean conditions; (2) **Publicly available** climate-linked early warnings, climate-enhanced stock, ecosystem, & risk assessments, & evaluations of climate-robust management response; (3) **Increased capacity to provide climate-informed advice** to support long-term sustainability & resilience.

Climate change is challenging but solvable

Overall, the latest studies on the net economic implications of decarbonisation – which also account for avoided climate damages – **point to overall benefit from the transition.** -

Prof Valentina Bosetti

If people are provided with opportunities to make choices supported by policies, infrastructure and technologies, there is an untapped mitigation potential to **bring down global emissions by between 40 and 70% by 2050** compared to a baseline scenario.

-Prof Joyashree Roy

The evidence is clear: there are now mitigation options available in all sectors that could together **halve global greenhouse gas emissions by 2030.** *-Dr Céline Guivarch*
