## **Introduction**

Electronic monitoring (EM) programs use video monitoring to track fishery activities. EM can be a practical alternative to carrying an on-board observer, particularly when the space or cost of an observer is prohibitive. The North Pacific Fisheries Management Council (NPFMC) established an intent to incorporate electronic monitoring (EM) as a tool of the North Pacific Observer Program for catch estimation in the fixed gear groundfish and halibut fisheries. In 2018, the NPFMC EM program fully incorporated EM in regulation as a monitoring option for fixed gear vessels in the partial coverage category of the North Pacific Observer Program.

The Pacific States Marine Fisheries Commission (PSMFC) began developing the Electronic Monitoring program in 2012 to evaluate the efficacy of using EM in the West Coast Trawl Rationalization Program. This effort ultimately led to the implementation of the current West Coast EM regulatory program in 2024. PSMFC has participated in the NPFMC working group and has conducted EM data review for the Alaska fixed gear EM program since 2014.

The vessels in the partial coverage category using EM are small boats (<60' LOA) fishing with longline or pot gear and targeting sablefish (*Anoplopoma fimbria*), Pacific cod (*Gadus macrocephalus*) and Pacific halibut (*Hippoglossus stenolepis*). Archipelago Marine Research (AMR) and Saltwater Inc. (SWI) provided and installed the EM systems, and PSMFC conducted the EM data review. This report outlines the EM data collected throughout 2023.

## **Vessel Participation**

Vessels in the partial coverage category that use fixed gear have the option to use EM instead of carrying an onboard observer. Vessel operators must register each fishing trip in ODDS before departure and will receive notification via ODDS if the trip is selected for EM trip coverage and review. Vessels made landings in ports including Homer, Kodiak, Sand Point, and Sitka.

## **Electronic Monitoring Systems**

AMR and SWI were contracted to provide and install EM systems, and to provide technical and logistical support. The on-board systems included a sensor to capture hydraulic pressure activity; a GPS to capture locations from which the speed of the vessel was calculated; and 3-5 cameras.

Sensor data (GPS and hydraulics) were collected at 10-second intervals when the EM system was fully powered on. Video began recording when the hydraulic pressure exceeded a trigger threshold set by the EM technician and specific to each vessel. In order to capture all catch handling, video recording continued for two hours past the last point when pressure was above the trigger threshold.

Video feed and system information were displayed on the user interface (typically installed in the wheelhouse) providing vessel operators with a live update of system performance, and continuous video feeds (even when not recording).

## **Effort Logs**

Effort logs were distributed to all of the participating vessels. Images of effort logs were transmitted to PSMFC. Longline and Pot effort log examples are provided in [Appendix 1](#).

## **Electronic Monitoring Video Review**

PSMFC reviewers used FishVue Interpret™ software from AMR. The software integrates the hydraulic sensor and GPS data with the synced video output. GPS data, dates and times are automatically recorded and reviewers added annotations to identify trips, hauls, and catch data. A configuration of this software allows review of both the AMR and SWI EM data.

The start and end locations, dates, and times of all trips and hauls were annotated. Other metadata such as the vessel information, ports, and fishery were either recorded by the hardware or annotated by the reviewer.

Reviewers recorded whether a streamer line, used as a seabird deterrent, was present or absent for each longline gear trip. Reviewers would randomly check at least 2 setting events to determine if streamer lines were used or not, and would record use as 'partial' if streamer lines were used on one haul, but not the other.

Reviewers recorded whether sensor and video data were complete for each haul based on the quantitative data from the sensor readings. Reviewers also assessed data quality and image quality for each haul. "Data Quality" was defined as the overall ability of the reviewer to effectively quantify and accurately identify catch data. Data quality could be impacted by a diversity of factors such as the image quality, catch handling, and camera angles or operation. Reviewers also gave specific ratings of the image quality and reasons for decreases in image quality (e.g. water spots on the camera, night lighting, etc.)

Species and counts of catch were recorded for a subset of hauls. In 2023, one of every three hauls were reviewed for trips with three or more hauls, and all hauls were reviewed for trips with less than three hauls. Catch was defined as anything seen by an EM reviewer, excluding free-moving marine birds and mammals alongside the vessel. The reviewers were instructed to record species to the lowest identifiable taxonomic level or grouping as required by the Alaska region.

Catch that was kept on the vessel (excluding use as bait or food) was considered retained; otherwise, catch was recorded as discarded<sup>1</sup>. Discards included marine organisms that fell off or out of fishing gear before it came onboard the vessel, or that were free-floating on the surface. For cases where the video stopped recording before catch handling was completed, fish that were onboard at the time of the video ending were reported as retained.

Discards were categorized as intentional or unintentional depending on the method of discard. Any fish that dropped off the gear (i.e., without visible shaking or other interaction by a crew member, or without hitting the roller) was defined as unintentional. All other discards were categorized as intentional. If a halibut was discarded, reviewers assessed the release method and condition when longline gear was used, and the condition only when pot gear was used.

Video reviewers recorded the number of minutes it took to review each haul. On-deck sort time was calculated from the start and end times of catch handling in the video. Review rate was calculated as review minutes divided by sort minutes.

---

<sup>1</sup> If camera views were not sufficient to see the whole deck, fish were recorded as retained or discarded based on whether they were retained or discarded at the rail. It is possible that some fish were brought onboard and later discarded out of view of the rail cameras; these fish would be recorded as retained in the EM data since the discard was not visible to the EM reviewer. In instances where fish were initially retained and later discarded in view of the rail cameras, the fish were recorded as discarded.

## Results

In 2023, there were 103 fixed gear vessels that participated in the EM program, completing 149 longline trips and 62 pot trips. By target species, there were 107 halibut trips, 32 Pacific cod trips, and 72 sablefish trips ([Table 1](#)). The data spanned 541 halibut sea days, 147 Pacific cod sea days, and 410 sablefish sea days for a total of 1,098 sea days with trips averaging 5.3 days across all fisheries.

There were 7,190 total hauls that comprised the reviewed trips, with 2,429 of these hauls reviewed for catch-level data collection. All catch data presented is from this subset of hauls.

**Table 1.** Summary of EM monitored fishing activity for 2023.

	Halibut Target		Pacific Cod Target		Sablefish Target				All Fisheries

Average Trip Length (Days)	6.0	4.1	4.8	4.2	4.2	5.7	7.8	5.8	5.3

## Effort Log

A complete logbook (either the EM effort log, or an alternative such as the IPHC logbook) was submitted with the video data for 209 of the 211 trips (99%; [Table 2](#)). The remaining 2 trips had no logbook submitted.

**Table 2.** Logbook submissions.

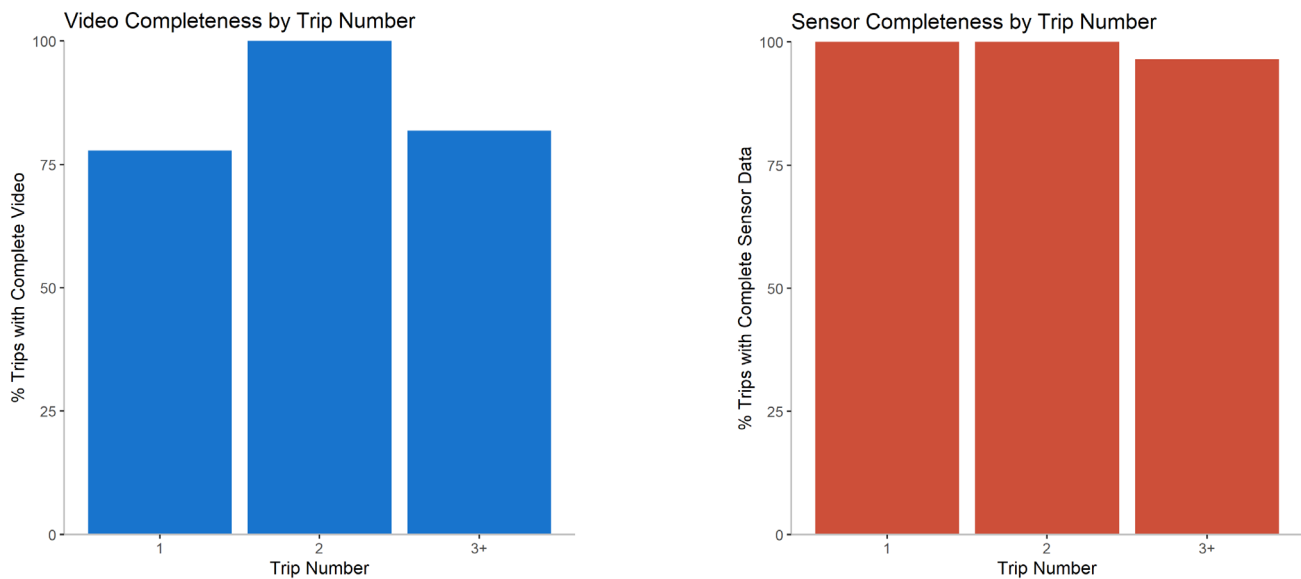

Logbook Submitted	Halibut Target		Pacific Cod Target		Sablefish Target				Total	%

## Data quality

Aspects of data quality including video and sensor completeness, overall data quality, and image quality were noted by reviewers for every reviewed haul ([Table 3](#)).

Video gaps were present in 18% of fixed gear trips, and 3% of hauls had video gaps that occurred during fishing activity; most often these gaps resulted from video ending before catch handling ended, video starting after catch handling had begun, one or more cameras not working, or from intermittent gaps in video coverage. All of these issues suggest technical problems relating to the set-up of the EM system. In the past, video data was somewhat more likely to be incomplete on the first trip that a boat took with an EM system ([Figure 1](#)), though that was not the case in 2023.

Data quality was rated as high or medium for 86% of the 2,429 reviewed hauls. The most common reason for low data quality was video completeness, followed by glare.

**Figure 1.** Video and sensor completeness in relation to the number of trips the electronic monitoring system had been on a specific vessel

**Table 3.** Data quality including video and sensor completeness, data quality, and image quality.

### Trip Level Data Quality

## Review Rate

Review rate for halibut and sablefish target fisheries ranged from 0.62 to 0.79 minutes of review per minute of video ([Table 4](#)). The review rate in the Pacific cod target fishery was slower and close to real time (e.g., one hour of catch handling could be reviewed in just under an hour).

Pacific cod longline hauls tended to have a larger variety of species caught, as well as being the only fishery where stern hauling was conducted. Stern haulers were more difficult to review due to a side view of the line (as opposed to a top down view), as well as poor lighting on the line at night.

**Table 4.** Review rate by target fishery. Review of both retained and discarded catch included.

	Halibut Target		Pacific Cod Target		Sablefish Target			
	Fixed Hook Longline	Snap Longline	Snap Longline	Single Pot - Rigid	Fixed Hook Longline	Snap Longline	String Pot - Rigid	String Pot - Slinky
Haul Count	240	138	91	1,668	32	24	63	173
Average Sort Min/Haul	115	126	98	4	164	146	104	121
Average Review Min/Haul	86	77	83	4	126	97	68	76
Average Review Min/Sort Min	0.79	0.65	0.87	0.99	0.75	0.71	0.64	0.62

## Seabird Deterrents

Streamer lines are used as seabird deterrents during longline gear deployment. In 2023, 65% of longline trips were confirmed to have used a streamer line. No streamer line was used for 22% of longline trips, and streamers were partially deployed for 3% of longline trips. The presence or absence of a streamer line could not be determined for 10% of longline trips.

**Table 5.** Presence of streamer lines on EM monitored longline trips.

Streamer Line Status	Halibut Target		Pacific Cod Target	Sablefish Target		Total
	Fixed Hook Longline	Snap Longline	Snap Longline	Fixed Hook Longline	Snap Longline	
Streamer Line Present	32	33	12	13	7	97
No Streamer Line	13	12	6	-	2	33
Partial	2	2	-	-	-	4
Unknown	8	5	1	1	-	15
NA	-	-	-	-	-	0
<i>Percent Trips with Streamer Line</i>	<b>58%</b>	<b>63%</b>	<b>63%</b>	<b>93%</b>	<b>78%</b>	<b>65%</b>

## Catch summary

Since total catch accounting is the goal for EM in the SE AK fixed gear sectors, all species of retained or discarded marine organisms were reported and summarized to the target fishery level ([Appendix 2](#)). Video reviewers identified a high proportion of retained and discarded catch to species. Exceptions were primarily those species that reviewers have been instructed to identify to a group level because they are too similar to reliably differentiate (e.g., shortraker/rougeye rockfishes, and arrowtooth/Kamchatka flounders). There were also a small proportion of rockfish that were recorded as “Rockfish – unidentified”.

For most discarded species, the majority were discarded after interaction with the vessel or a crew member ([Appendix 2](#)). Interactions included the crew member throwing the fish overboard after the fish came onboard; a crew member shaking the line or manipulating the hook to release the fish before the fish came onboard; or the fish hitting the vessel and falling back into the water while no crew was attending the line.

## Pacific halibut

Reviewers recorded the method of release (longline only) and the condition of each individual halibut at the time of release. These release methods and condition ratings were identical to those used by the observer program with the addition of three new release methods after consulting with the observer program: “Hand release”, “Other careful release” and “Other non-careful release”. The majority (86%) of Pacific halibut were released carefully using the “Hook twisting and shaking” method ([Table 6](#) and [Appendix 3](#)). The next largest release method (10%) was a “Other non-careful release” method.

**Table 6.** Pacific halibut counts for each release method by target fishery.

Release Method	Pacific Halibut Target				Pacific Cod Target				Sablefish Target				All Fisheries			
	Fixed Hook Longline	Snap Longline	Snap Longline	Single Pot	Fixed Hook	Snap Longline	Pot Rigid	Slinky Pot	Total	% of total

<b>Grand Total</b>	<b>7,240</b>		<b>3,320</b>		<b>1,982</b>		<b>97</b>		<b>355</b>		<b>260</b>		<b>148</b>		<b>1,059</b>	

Most halibut were judged to have minor damage at the time of release, of those that could be assessed (83% of those assessed; [Table 7](#)). Without corresponding release condition data from onboard the vessel, it is not possible to test how well a video reviewer can assess halibut release condition from EM data. A halibut was given a release condition of “unknown” if the video reviewer could not observe both sides of the fish and the injuries could not be observed clearly at point of release. A release condition was not possible to capture for 71% of the discarded halibut across all fisheries.

### **Review Turnaround Time**

In 2022, the AK fixed gear EM review team was expanded from two full-time staff to three full-time staff in an effort to improve review turnaround time. An additional full-time reviewer will be added to the review team in 2024, bringing the total to four full-time review staff for the AK fixed gear EM program, to further improve turnaround time.
