

# Alternative Models for BSAI Northern Rock Sole

Carey R. McGilliard and Jim Ianelli  
September 2024

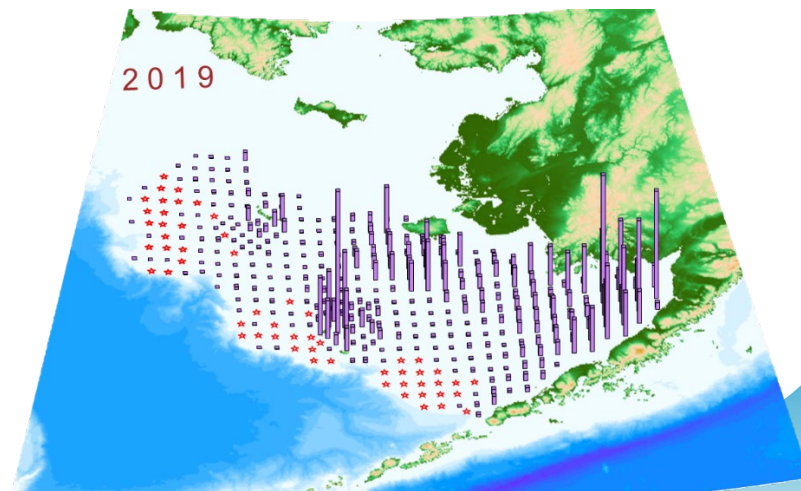

**NOAA**  
**FISHERIES**

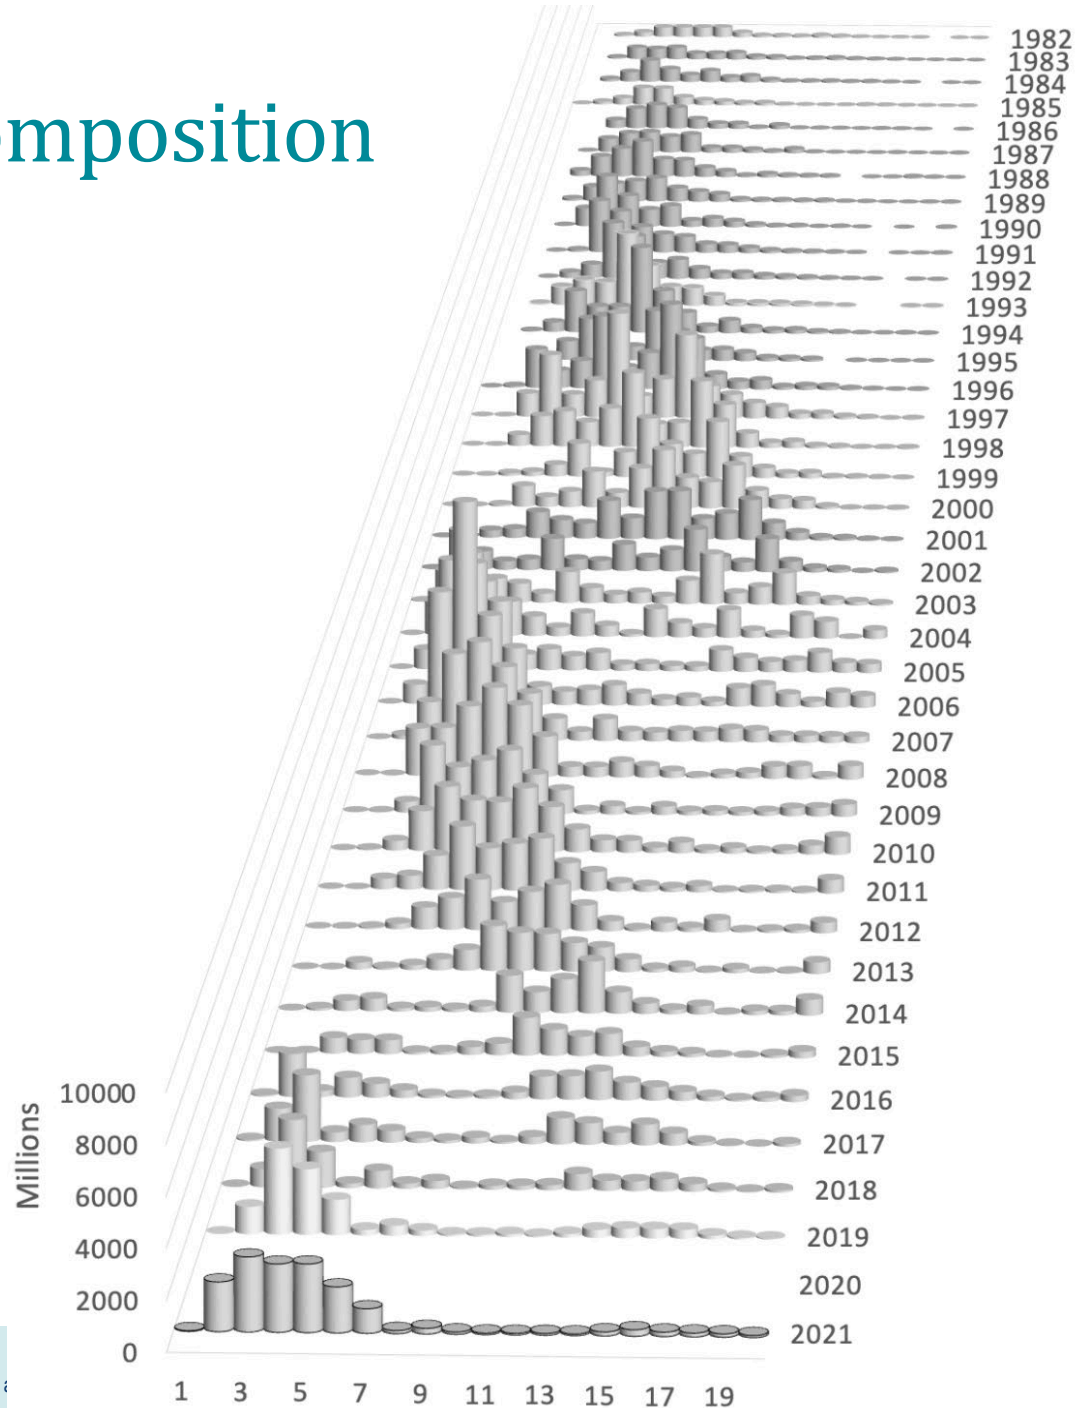

# Catch Time series

# Survey CPUE (previous years)

# Survey age composition

# Data inputs

- Yearly empirical mean weight-at-age estimates
- Fishery age composition
- EBS shelf bottom trawl survey index
- EBS shelf bottom trawl survey ages

# General model setup

- Parameters estimated within the model:
  - Yearly time-varying fishery selectivity (sex-specific)
  - Male fishery selectivity offset (time-invariant)
  - Time-invariant logistic survey selectivity (sex-specific)
  - Survey catchability (with prior), time-invariant
  - Male natural mortality (with prior)
  - Female natural mortality (with prior; Model 24.2)
  - Mean recruitment, mean fishing mortality, recruitment and fishing mortality deviations
  - Initial age comps
  - Bmsy, Fmsy
- Parameters estimated outside of the model
  - $\sigma_R = 0.6$
  - Female natural mortality = 0.15 (Model 18.3\_new, Model, 22.1, Model 24.1)
  - Maturity-at-age

# Life history

- Plus group at age 20 (age 37 has been observed in the data)
- Spawn December – March
- Separate winter spawning and summer feeding grounds
- Northern spawning area near the Pribilof Islands appears very successful in warm years (Cooper et al. 2020)
- Time-varying, sex-specific growth

# Maturity ogive from a 2012 paper

# Models presented and used in bridging

- Model 18.3: The 2022 accepted model
- Model 18.3\_new: the 2022 accepted model with available new data
- Model 22.1: As for 18.3\_new, but with Francis data weighting
  - Current ABC is the OFL from the 2022 version of this model.
- Model 24.1: As for Model 22.1, but with Hulson et al. 2023/Stewart and Hamel 2014 input sample size approach
  - Uses afscISS package for input sample sizes and calculating survey age comp data
- Model 24.2: As for Model 24.1, but estimates female natural mortality with lognormal prior
  - (male M already estimated in all models)

# Candidate models in bold

- Model 18.3: The 2022 accepted model
- **Model 18.3\_new**: the 2022 accepted model with available new data
- Model 22.1: As for 18.3\_new, but with Francis data weighting
  - Current ABC is the OFL from the 2022 version of this model.
- **Model 24.1**: As for Model 22.1, but with Hulson et al. 2023/Stewart and Hamel 2014 input sample size approach
  - Uses afscISS package for input sample sizes and calculating survey age comp data
- **Model 24.2**: As for Model 24.1, but estimates female natural mortality with lognormal prior
  - (male M already estimated in all models)

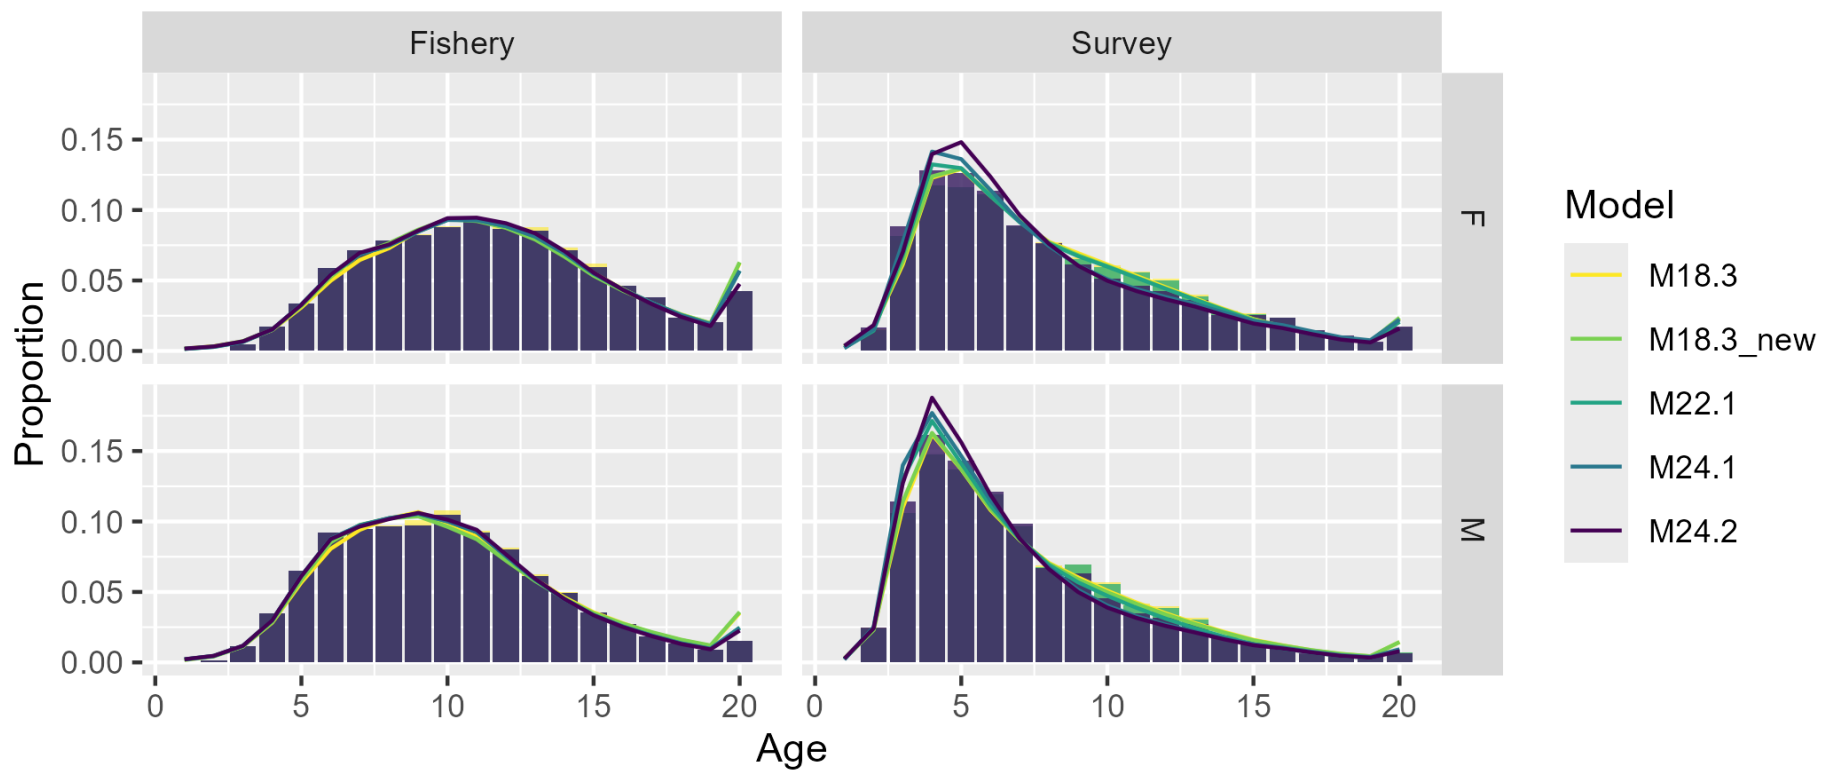

# Bridging: Fits to survey biomass

Bottom trawl survey biomass index

**NOAA**  
FISHERIES

# Bridging: Fits to age composition data

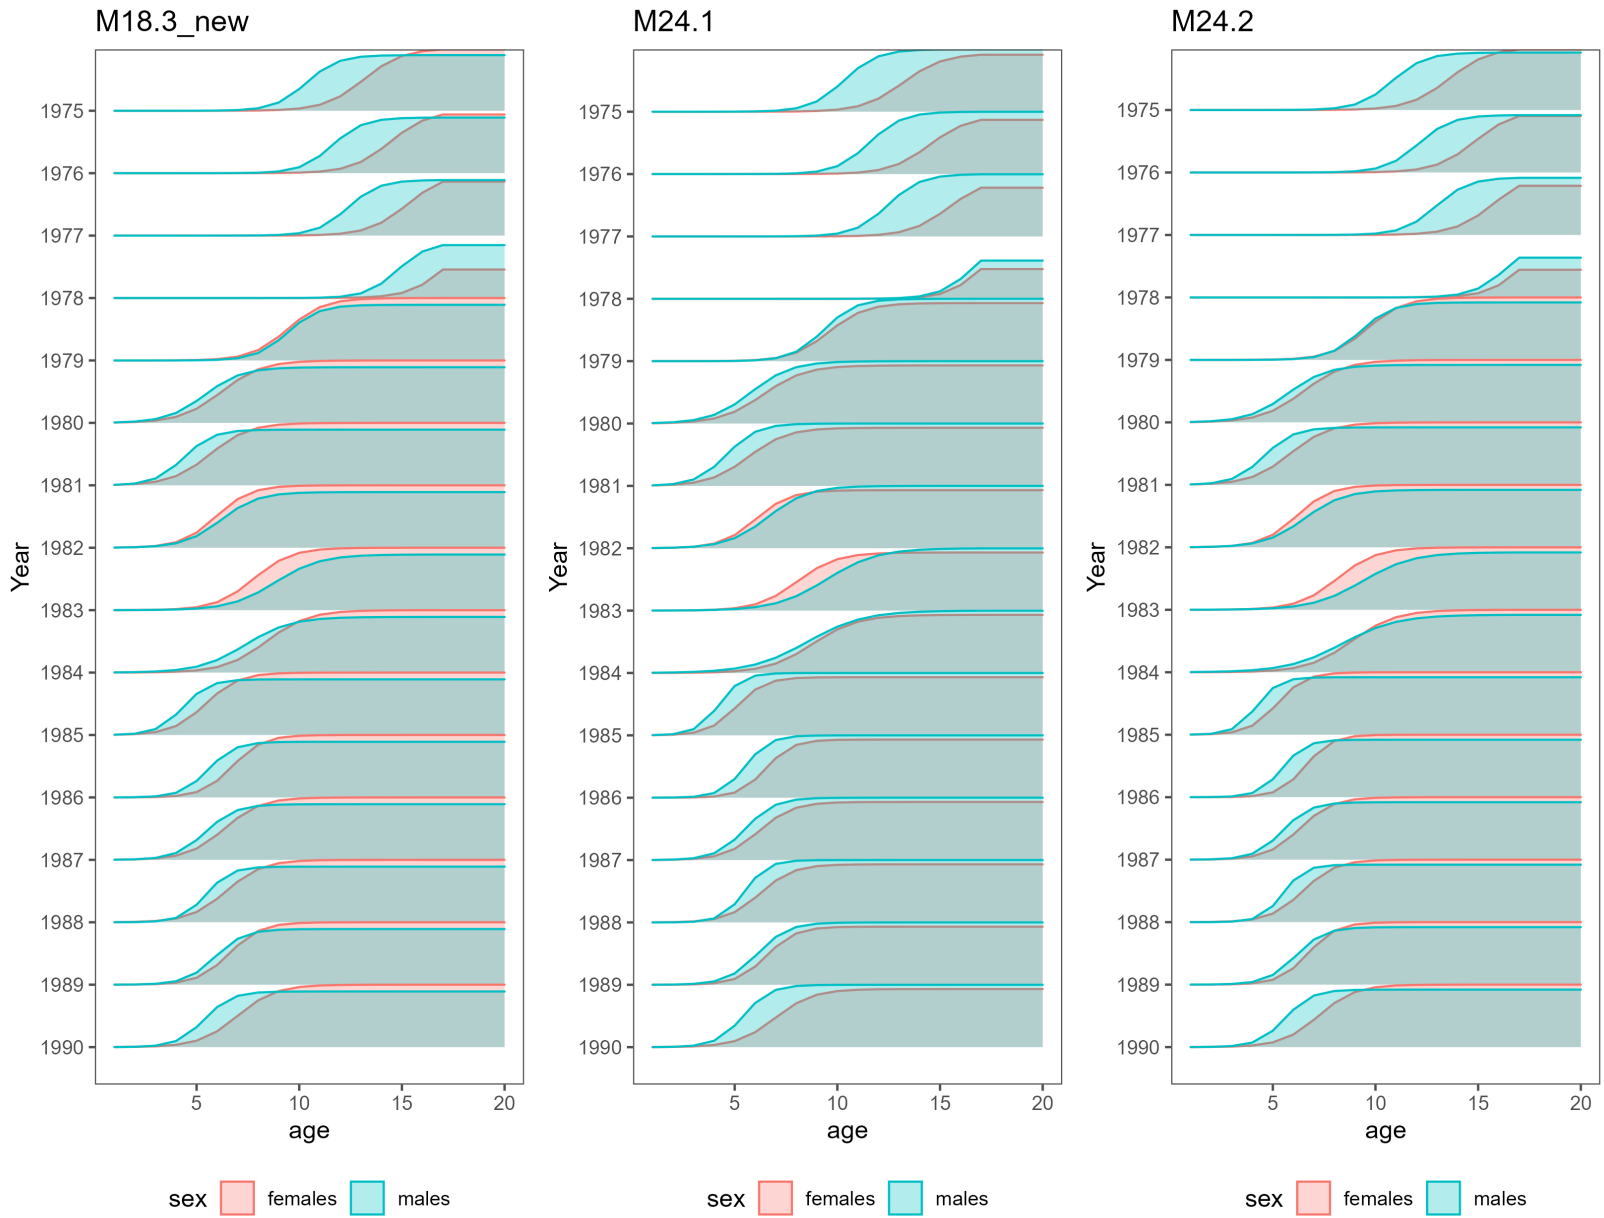

# Bridging: Spawning biomass and recruitment estimates

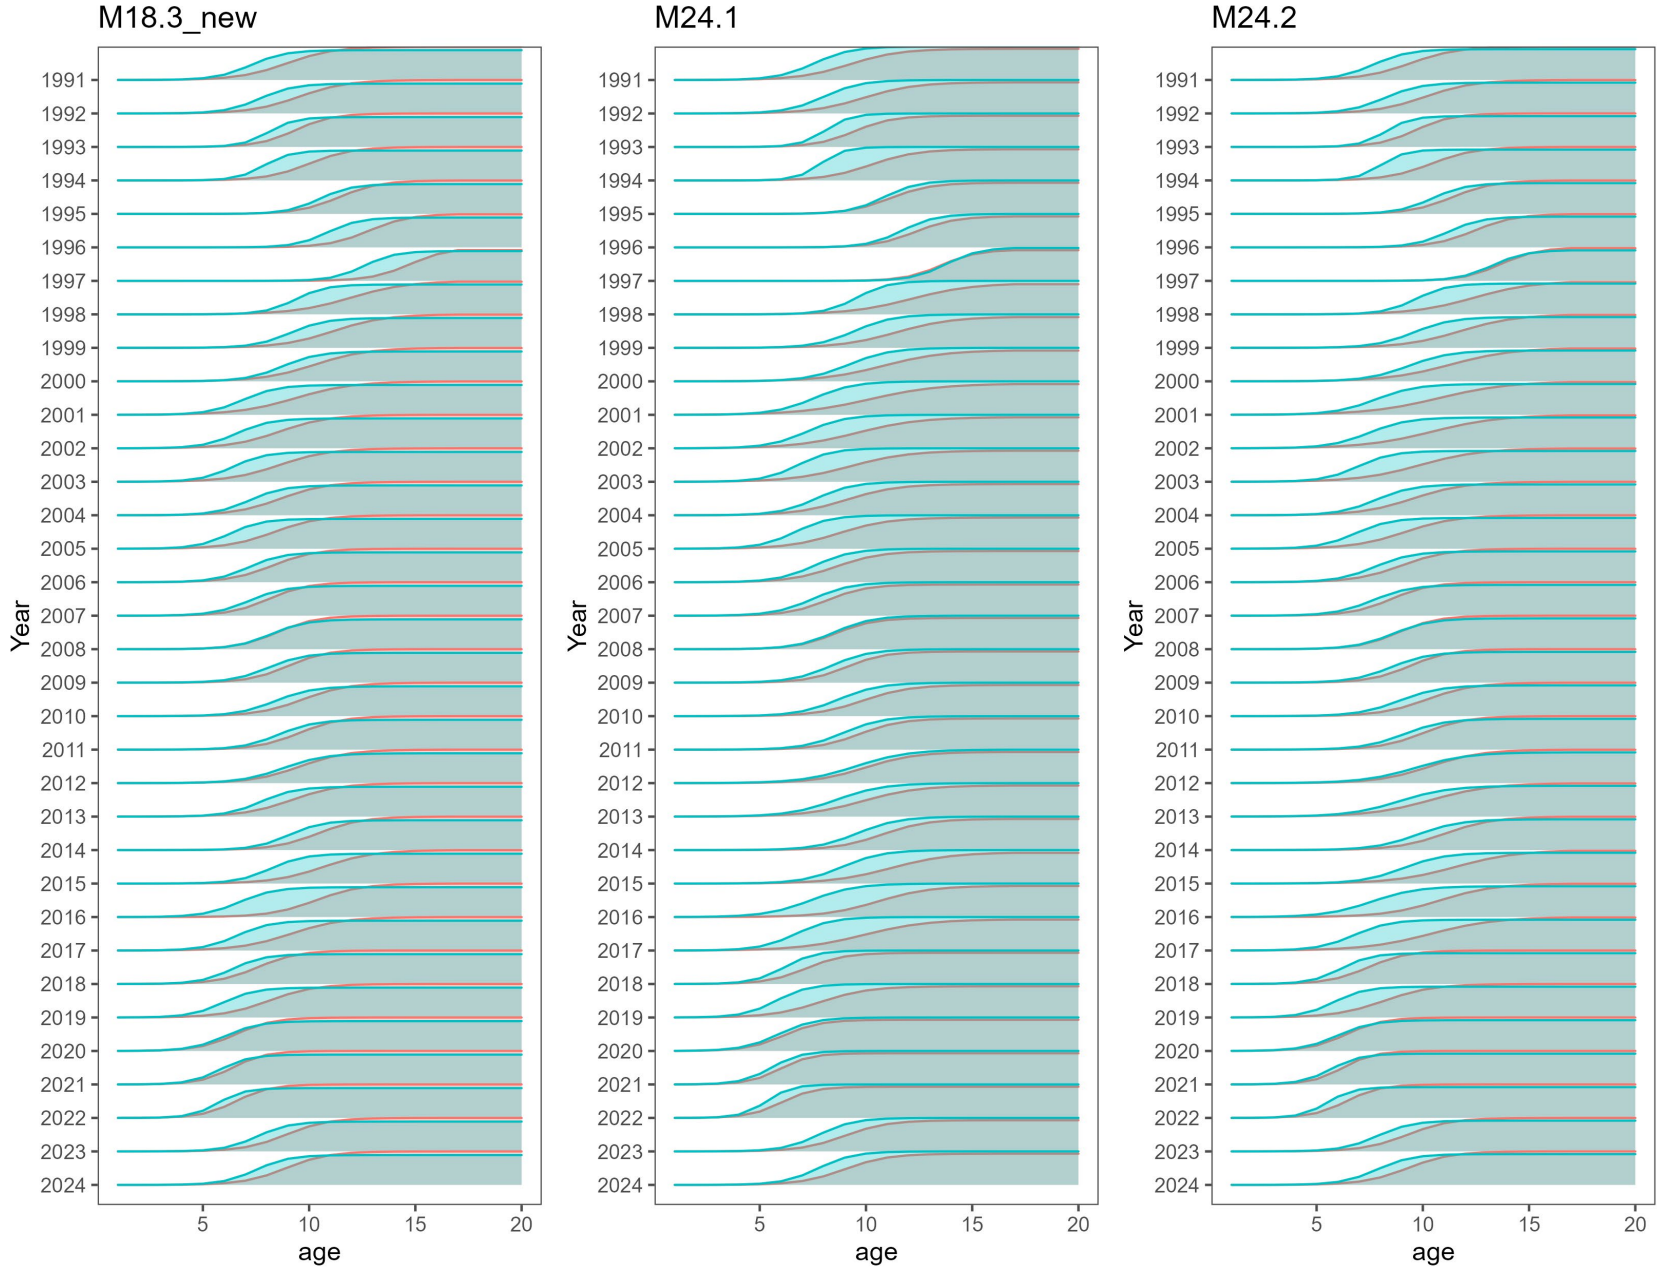

# Bridging: Survey selectivity

# Candidate models: early fishery selectivity

# Candidate models: later fishery selectivity

# Stock-recruit curves

# Sex Ratios

# Retrospective analysis: Spawning biomass

## Model 18.3\_new

## Model 24.1

## Model 24.2

# Retrospective analysis

## Model 18.3\_new

## Model 24.1

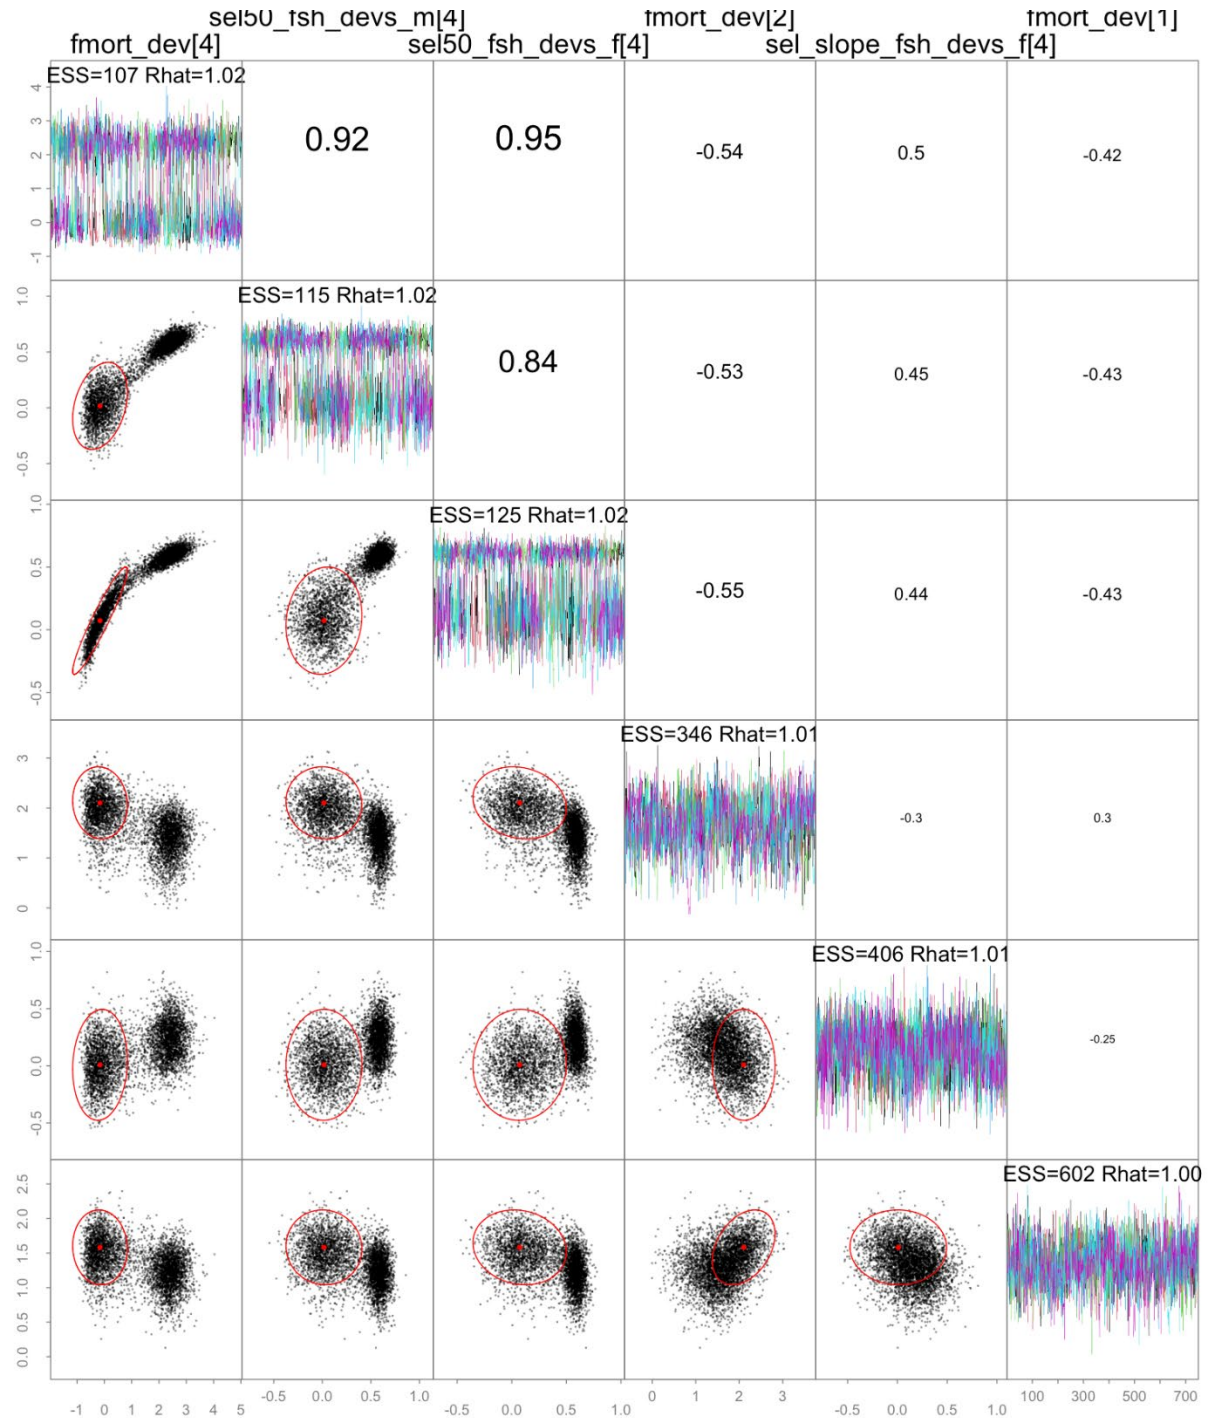

## Model 24.2

# Bayesian analysis: M24.2

## Slowest-mixing parameters

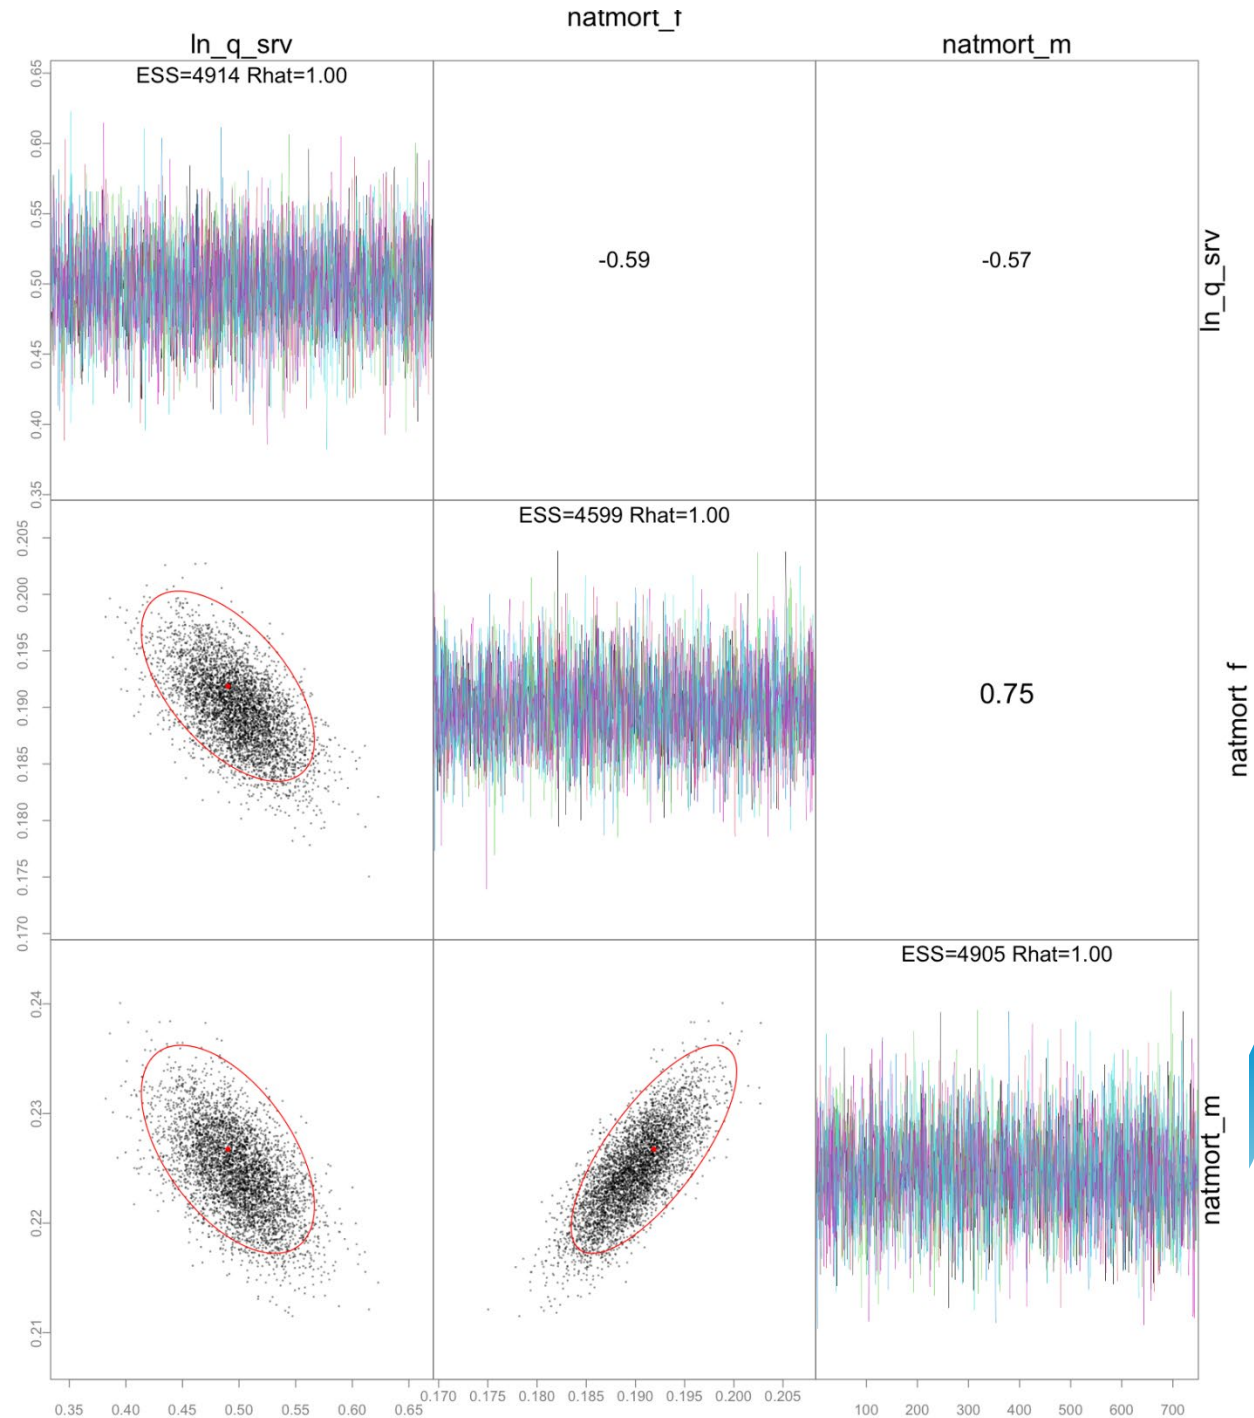

# Bayesian analysis: M24.2

## Natural mortality and catchability

### MLE estimates

- Female M 0.19 (sd 0.003)
- Male M 0.225 (sd 0.004)
- q 1.638 (sd 0.05)

# Bayesian analysis: M24.2

## Marginal posteriors for derived parameters

# Potential future research

- Explore data conflict between survey biomass and survey age data: is age-specific availability to the survey time-varying and why?
- Account for uncertainty in maturity
- Re-parameterize/simplify fishery selectivity for years without fishery age data
- Incorporate ageing-error matrix
- Further exploration of linkages between population dynamics and environmental conditions and accounting for uncertainty in future environmental conditions in estimating future ABCs and OFLs
- Refine fishery input sample sizes based on ongoing research (Hulson, Barbeaux, and others)

## Pearson

# OSA residuals for fishery ages (males)

## Model 18.3\_new

## Model 24.2

## Pearson

## Pearson

# Are the OSA residuals for fishery ages normally distributed?

Model 18.3\_new (females)

Model 24.2 (females)

# Are the OSA residuals for fishery ages normally distributed?

Model 18.3\_new (males)

Model 24.2 (males)

# A few sensitivity runs

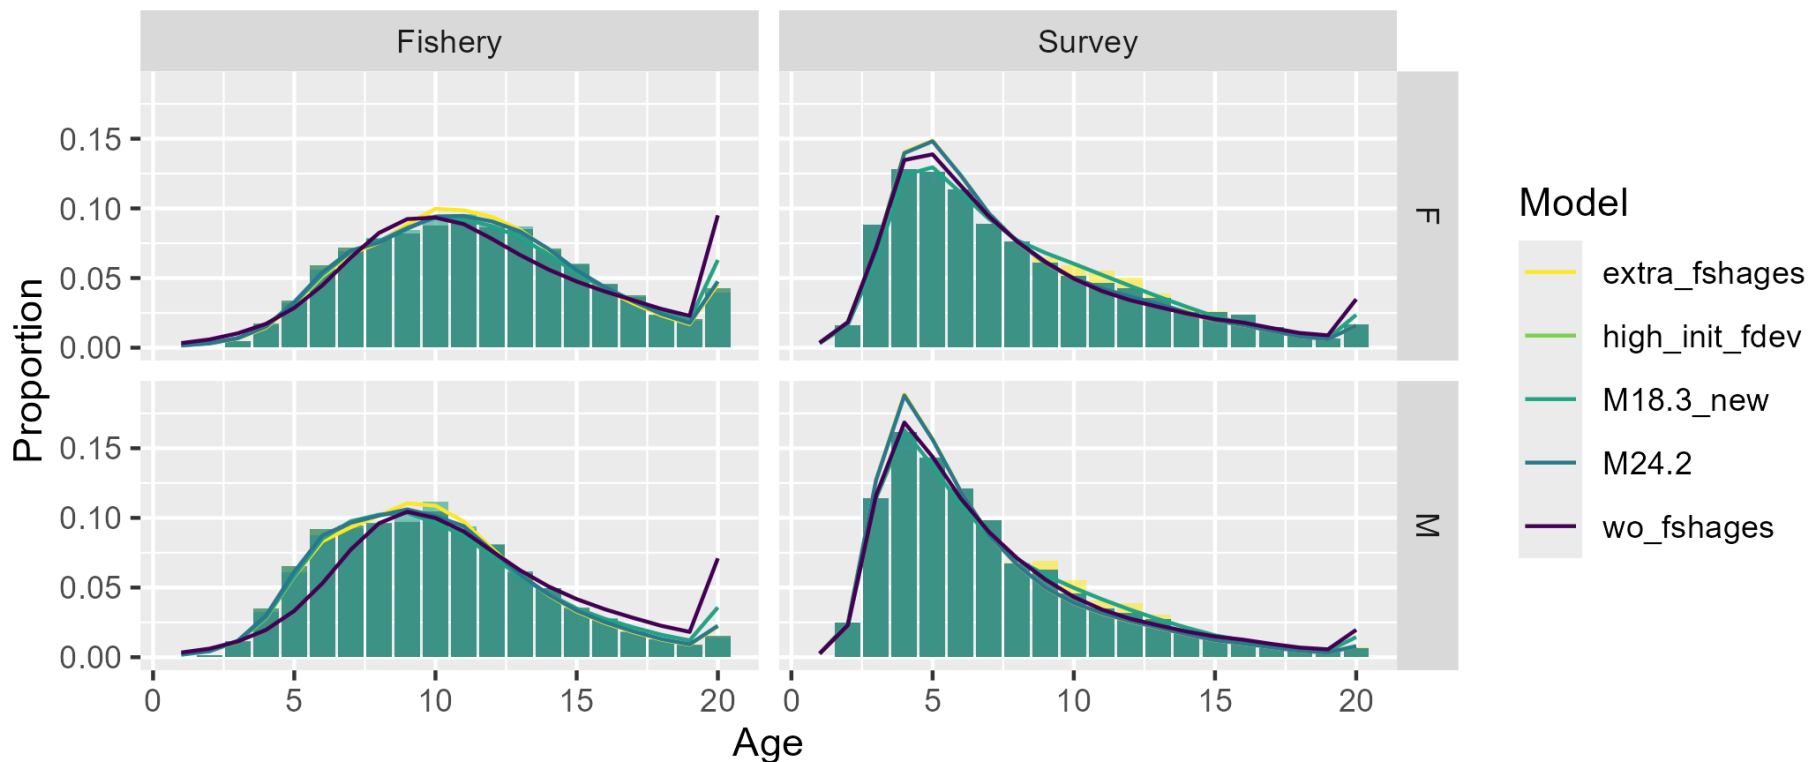

- Include previously used 1995-1997 fishery ages (unknown origin; not in observer database)
- Initiate the model with a high initial F deviation for 1978
- Leave out fishery age compositions from the model
  
- Note: further lowering survey age comp sample sizes after Francis data weighting led to non-convergence
