

GOA ROCKFISH ASSESSMENT UPDATES

- Length-stratified rather than random growth estimation
- Extension of ageing error matrix
 - Update of ageing error matrix for POP
- Plus age group analysis redo

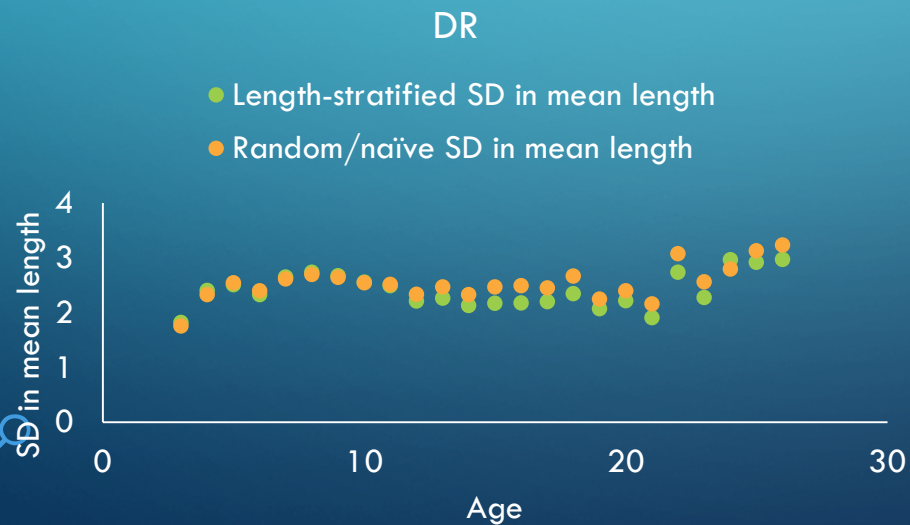

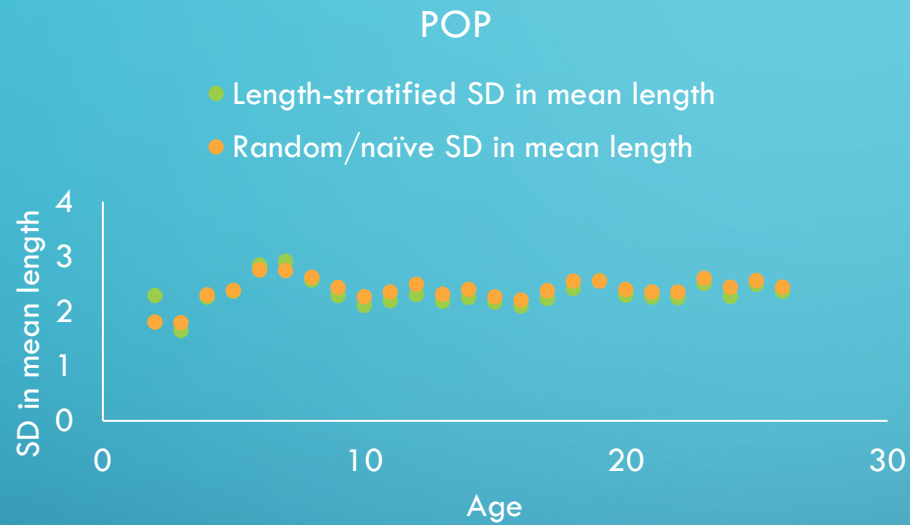

Length-stratified rather than random growth estimation: mean length

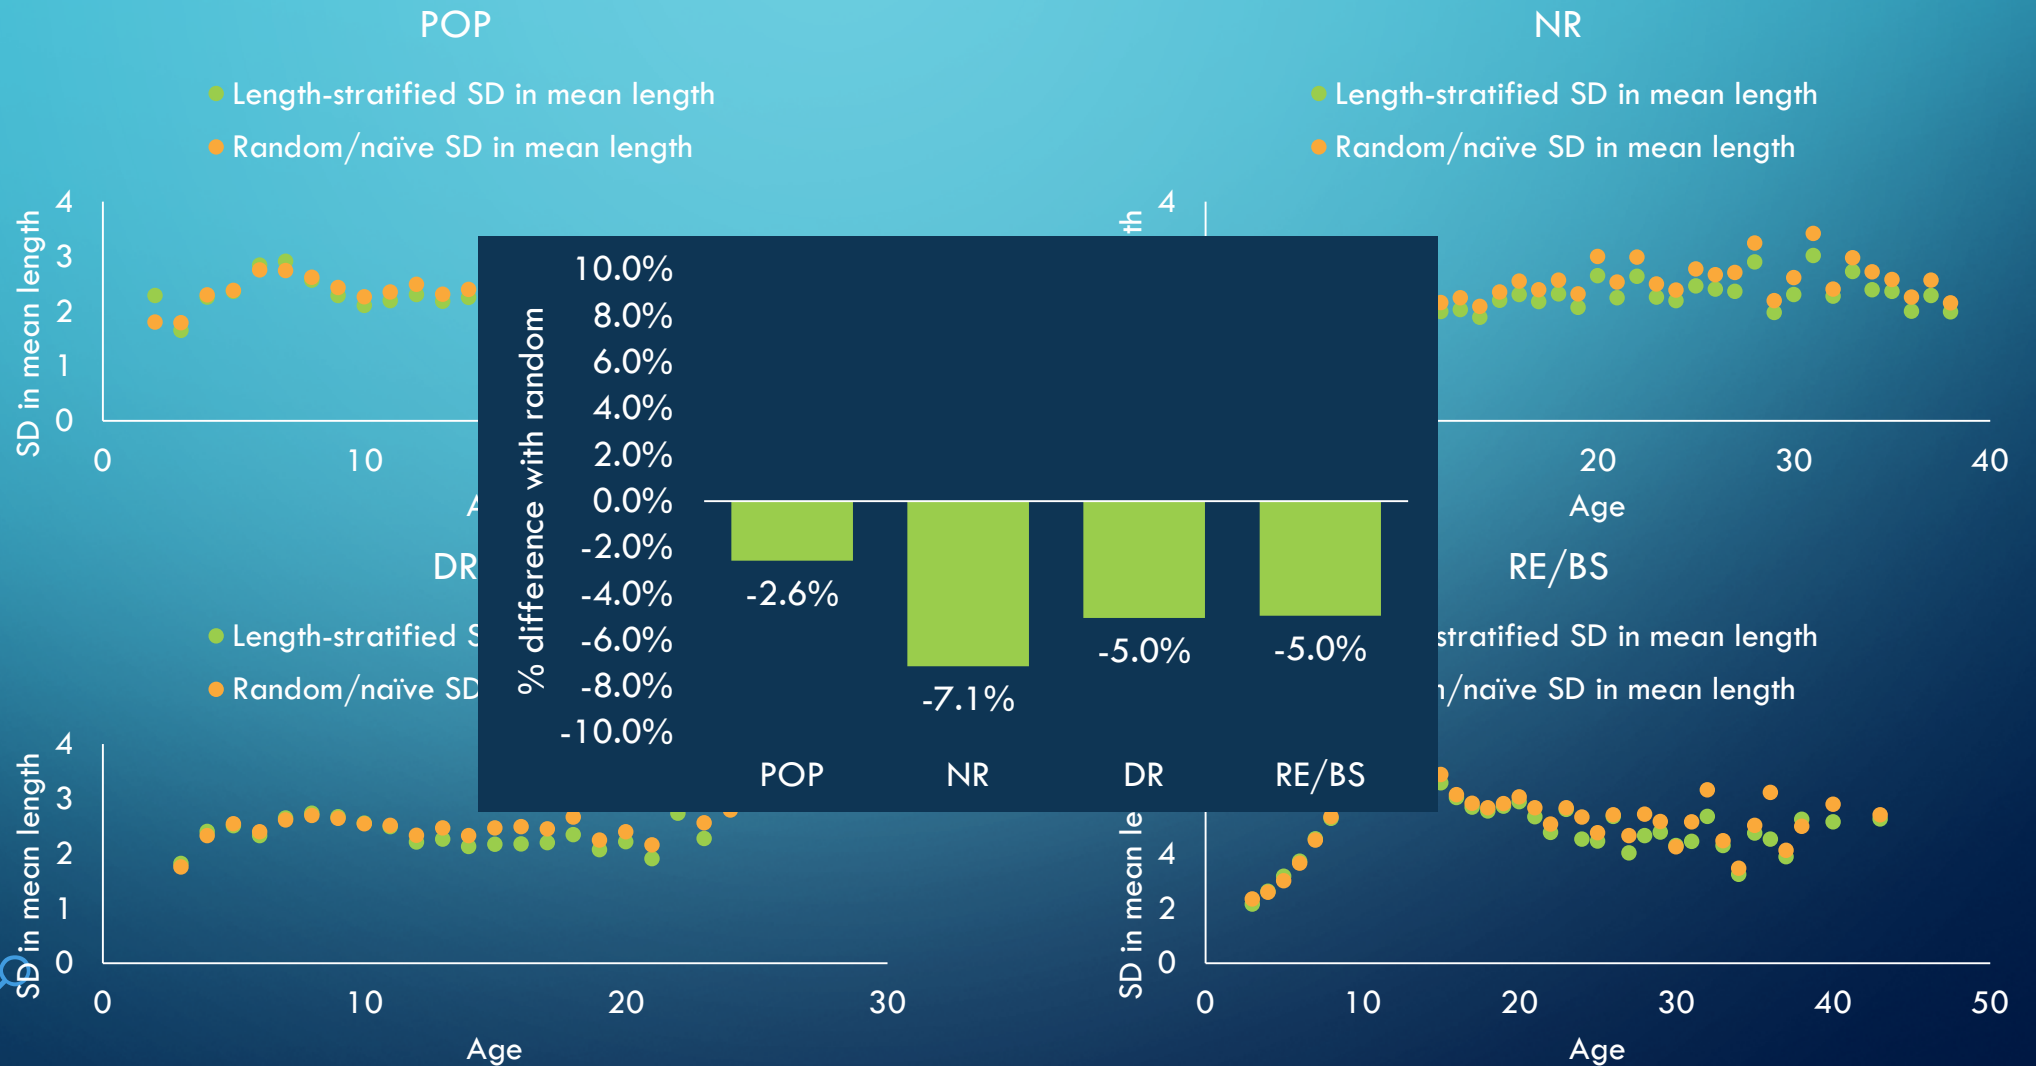

Length-stratified rather than random growth estimation: mean length

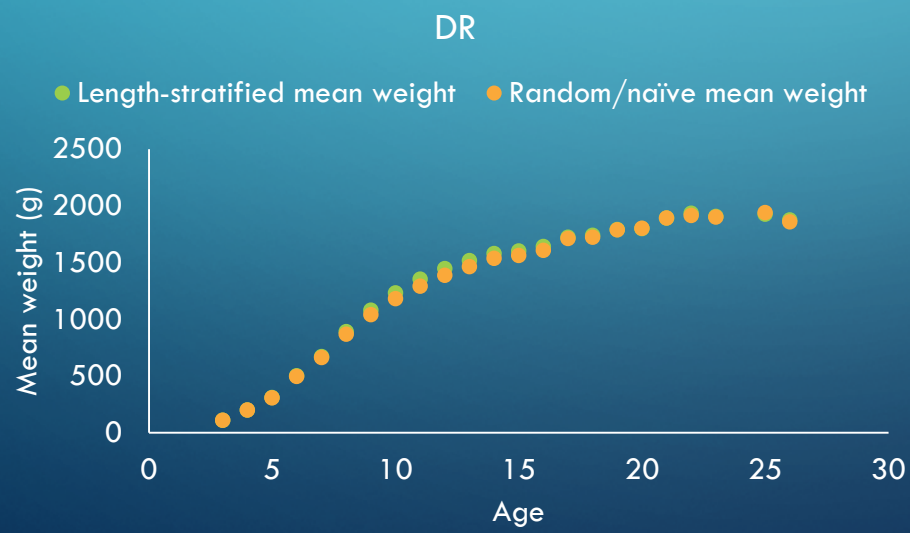

Length-stratified rather than random growth estimation: SD in mean length

Length-stratified rather than random growth estimation: SD in mean length

Length-stratified rather than random growth estimation: mean weight

Length-stratified rather than random growth estimation: mean weight

GOA ROCKFISH ASSESSMENT UPDATES: AGEING ERROR MATRIX

- Reminder: 2 years ago presented alternative to current construction of ageing error matrix, gist was:
 - We were/are having an issue with overestimating the proportion of fish in the age class adjacent to the plus age group
 - One solution was to extend modeled ages out until $>99.9\%$ were in plus age group of data ages (compared a couple other alternatives as well)
 - Had pretty big influence on improving fit to adjacent age to plus age and plus age group itself
 - This year implement into GOA rockfish models

GOA ROCKFISH ASSESSMENT UPDATES: LIKELIHOOD RESULTS

POP			
Likelihood	2014 model	Updated 2014 model	% difference
Catch	0.12	0.12	6.62%
BTS biomass	10.26	11.18	8.96%
Fishery age	27.06	18.20	-32.74%
BTS age	47.67	30.33	-36.38%
Fishery size	54.28	54.52	0.44%

NR			
Likelihood	2013 model	Updated 2013 model	% difference
Catch	0.04	0.06	45.40%
BTS biomass	11.10	10.42	-6.11%
Fishery age	25.54	21.25	-16.77%
BTS age	45.71	42.38	-7.29%
Fishery size	41.59	44.47	6.93%

DR			
Likelihood	2013 model	Updated 2013 model	% difference
Catch	27.14	28.09	3.50%
BTS biomass	38.84	39.94	2.84%
Fishery age	30.23	18.68	-38.19%
BTS age	85.83	79.03	-7.93%
Fishery size	49.93	49.69	-0.49%

RE/BS			
Likelihood	2014 model	Updated 2014 model	% difference
Catch	0.04	0.04	-1.44%
BTS biomass	8.93	8.92	-0.18%
LL RPN	11.92	11.90	-0.20%
Fishery age	37.27	13.52	-63.74%
BTS age	39.30	37.44	-4.73%
Fishery size	51.36	49.00	-4.61%
LL size	97.71	85.62	-12.37%

GOA ROCKFISH ASSESSMENT UPDATES: AGEING ERROR

GOA ROCKFISH ASSESSMENT UPDATES: AGEING ERROR

GOA ROCKFISH ASSESSMENT UPDATES: AGEING ERROR

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

- With new ageing error matrix, was curious to see how that influenced where we set the data plus age
 - Needed to investigate for RE/BS anyway, ran for others as well
 - Extended data plus age from age 20 to 77
 - Stored SDNR of age comps, likelihoods, etc.

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

Scaled SDNR: POP

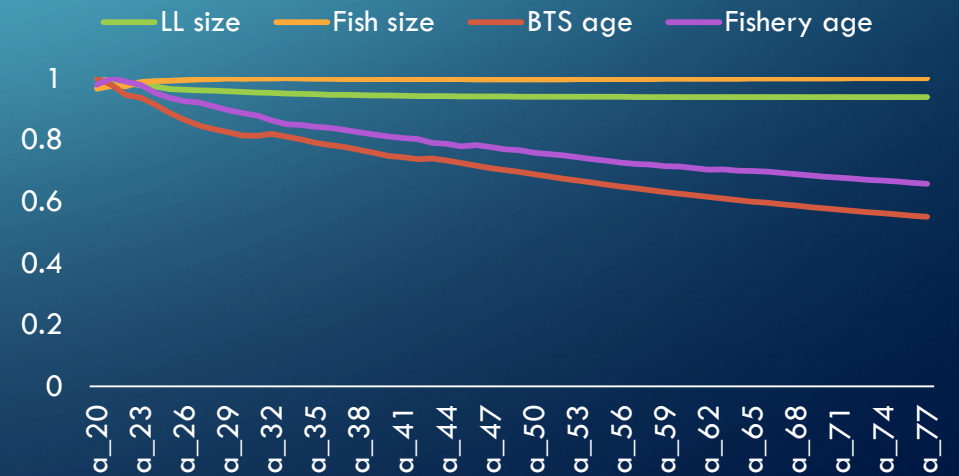

Scaled SDNR: NR

Scaled SDNR: DR

Scaled SDNR: RE/BS

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

Scaled likelihoods: POP

Scaled likelihoods: NR

Scaled likelihoods: DR

Scaled likelihoods: RE/BS

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

- Total likelihood plateaus/minimizes around:
 - 35-40 for POP, 50-55 for NR, 35-40 for DR, and 45-50 for RE/BS

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

GOA ROCKFISH ASSESSMENT UPDATES: PLUS AGE ANALYSIS

- Overall, hard to pinpoint general recommendations for setting plus age group
- Plateauing of total seemed the only consistent statistic, but could be others
- Plan: rerun with updated 2015 data, see consistency as well as possible recommendations for extending plus age group

An underwater photograph showing a group of reddish-brown fish, likely Blackspotted Rockfish, swimming near a large, green, branching coral structure. The background is dark blue, suggesting deep water. The fish are positioned in the lower half of the frame, moving towards the right. The coral is on the left side, with some white starfish-like organisms attached to it.

GOA Rougheye & Blackspotted Rockfish

Shotwell, Hanselman, Hulson, Heifetz

SSC and Plan Team 2014

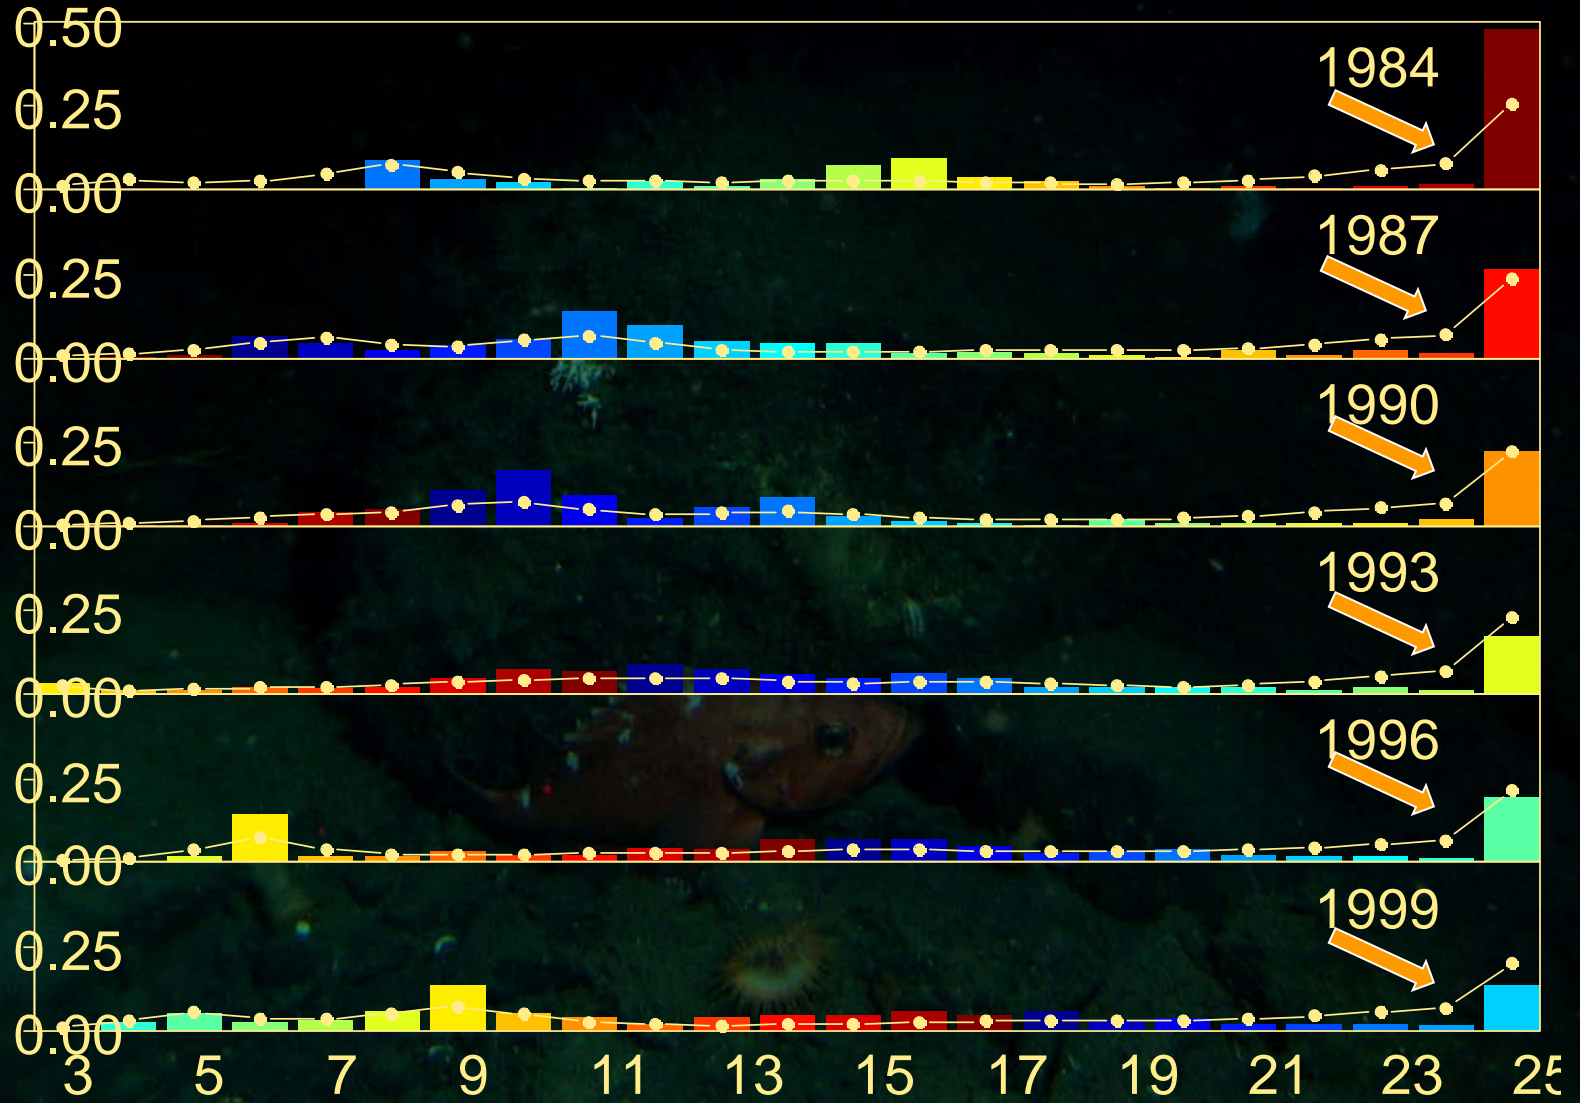

“The assessment authors note that the choice of the plus group age, and the computation of the age error for the plus group, will be addressed in the 2015 assessment. The Plan Team supports the planned work to address these issues.”

“The SSC requests that the authors further examine trawl selectivity, as it seems unusual for age 9-11 rockfish to be selected 20% more than other ages. The SSC supports the authors’ intent to reevaluate that age of the plus group...”

1) RE/BS Selectivity

2) Nonplussed (Trawl)

Selectivity Background

- All GOA rockfish models used non-parametric selectivities in the past
 - A vector of selectivity coefficients were estimated up to a maximum age and the rest held at that value up to the plus group
 - The coefficients are “regularized” by second differences (the differences between the differences)
 - A penalty is applied that minimizes these differences
- 

Differences

Parameters

<u>Differences</u>	1	4	6	10	12	15	20	
1st		3	2	4	2	3	5	$9+4+16+4$ $+9+25=67$
2nd		1	2	2	1	2		$1+4+4+1$ $+4 = 14$
3rd			1	1	1			$1+1+1=3$
4th				0	0			$0+0=0$

Selectivity Options

- RE/BS is only GOA rockfish still using non-parametric, most are logistic now, with one gamma
- The current trawl survey selectivity is very lightly penalized
- Implies a dome-shape
- Impose smoother form?

Selectivity options

- BASE (very low 2nd difference penalty) implies linear *a priori*
- 3rd Diff_10 (penalty of 100 on 3rd differences), fixed selectivity after age 12 implies dome *a priori*
- 3rd Diff_Hi (penalty of 100 on 3rd differences), fixed selectivity after age 20 implies dome *a priori*
- 3rd Diff_Lo (penalty of 20 on 3rd differences), fixed selectivity after age 20 implies dome *a priori*
- 3rd Diff_max_5 (penalty of 100 on 3rd differences), selectivity is fixed at least 5 ages before maximum age
- Gamma (imposes a dome, though can be slight)
- Logistic (forces asymptotic)

Plus group

- Pete already talked about modeling ages out to aging error matrix $p > 0.99$
- Growth, maturity, etc extended (work on this)
- Simultaneously look at trawl selectivity and plus age group
- Look at likelihood fits to key data components

Plus age: scaled (value divided by max)

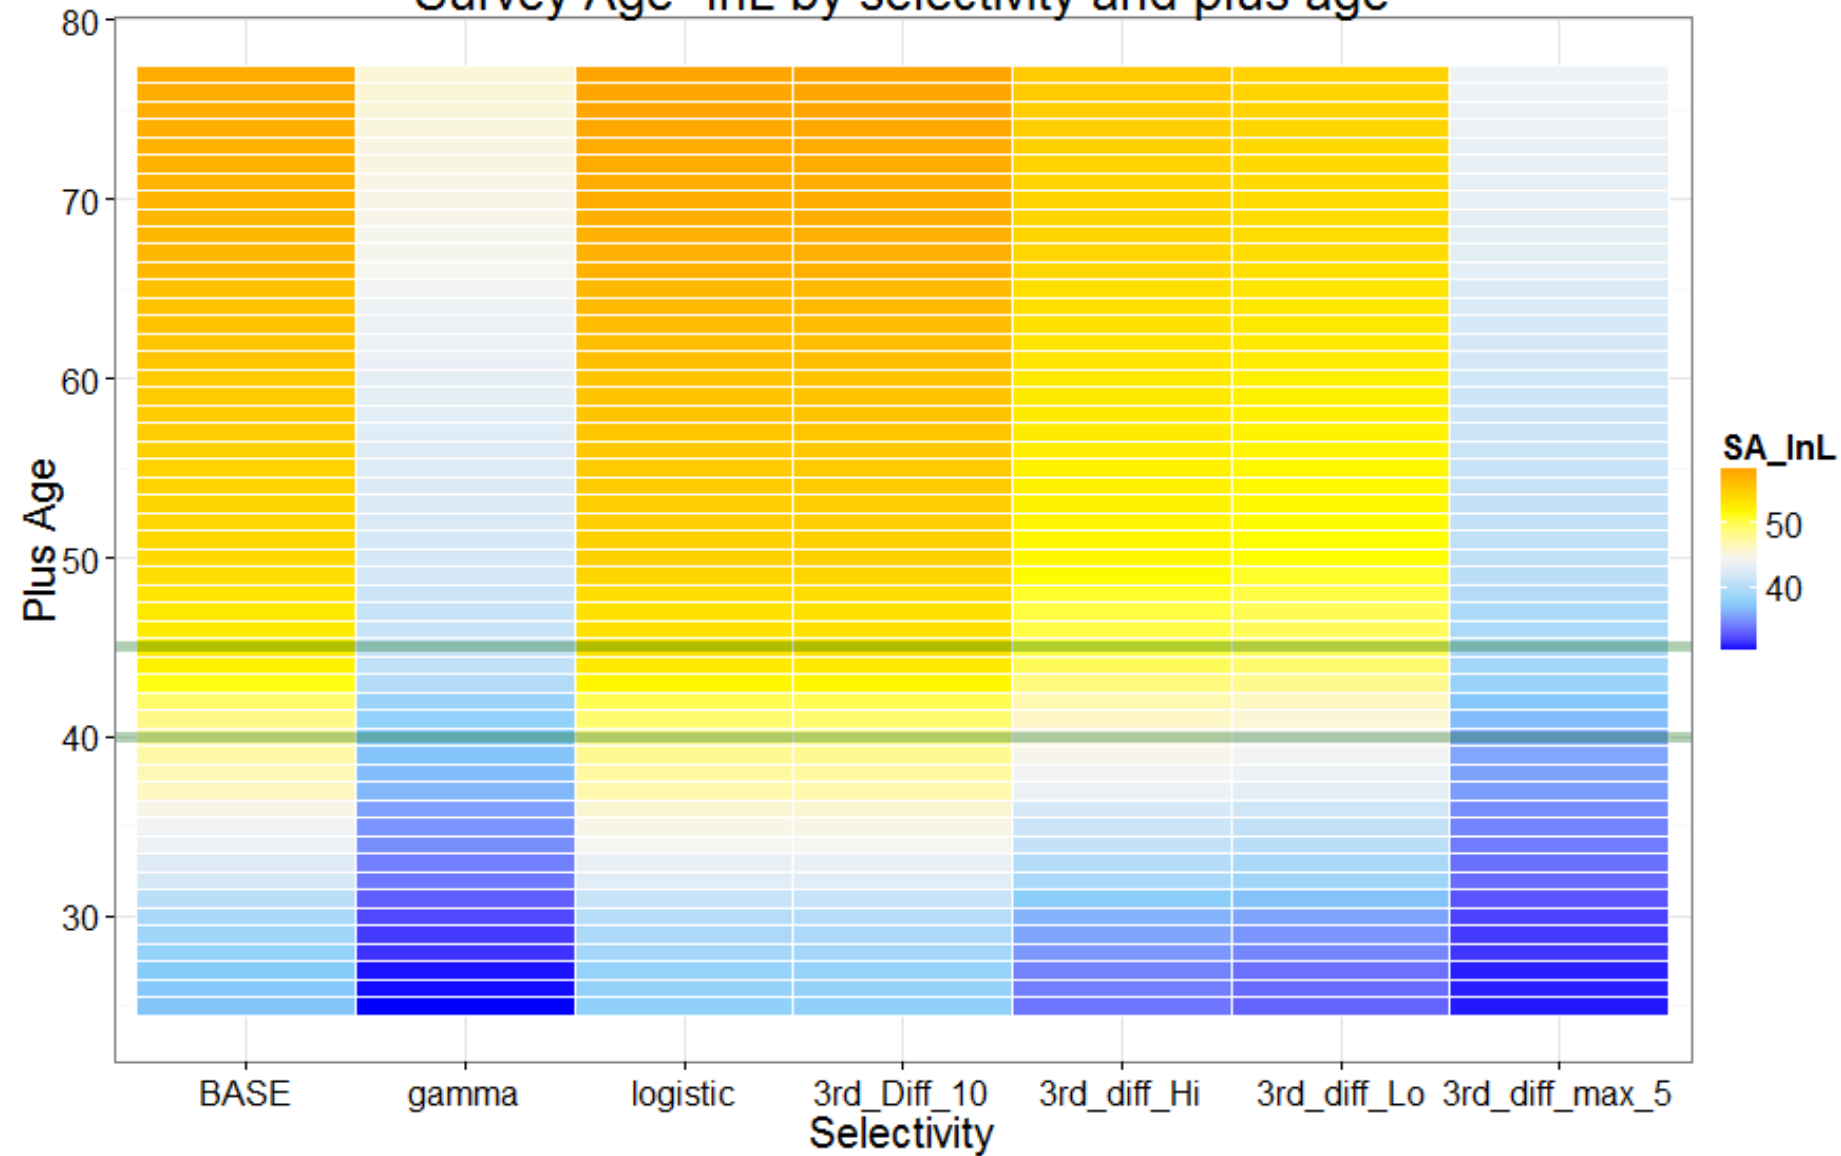

- Scaled likelihood for indices shows tradeoff between BTS and LL. At age 37 is where the scaled values meet...
- For total/data likelihoods, total flattens out around age 45, data likelihood keeps on increasing but seems to bend at 42
- Suggests maybe setting plus age >37 as a starting point

Data -lnL by selectivity and plus age

Survey Age -InL by selectivity and plus age

Trawl Survey -InL by selectivity and plus age

LL Survey size -lnL by selectivity and plus age

ABC by selectivity and plus age

Selectivity curves for plus age 42

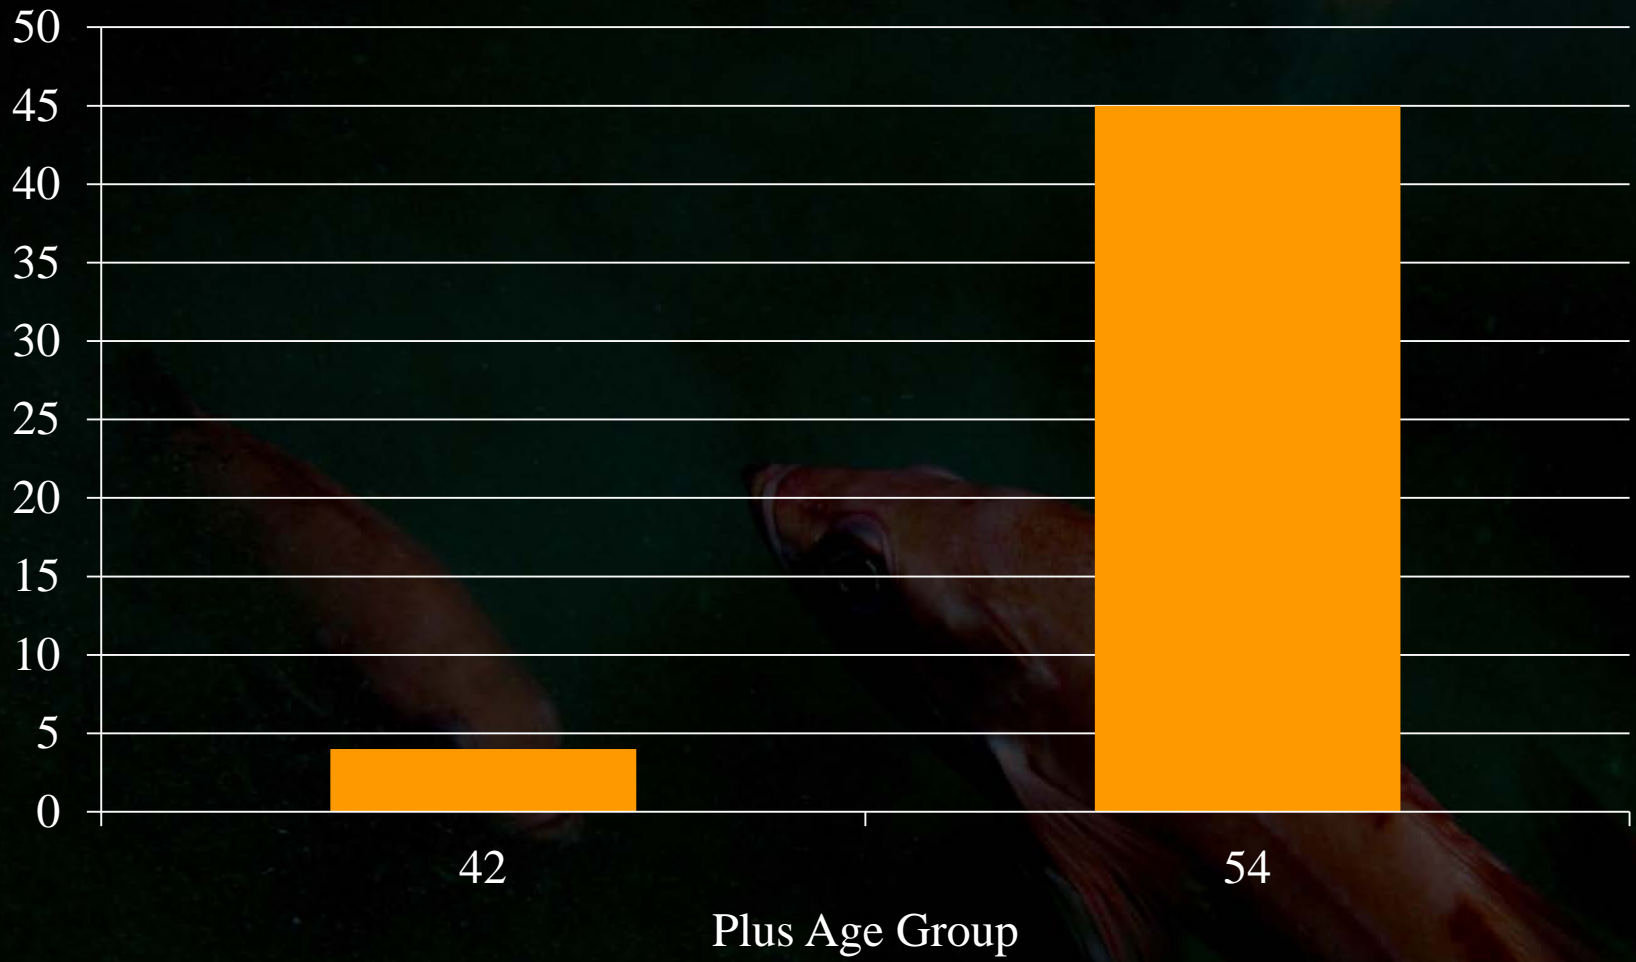

Other diagnostics

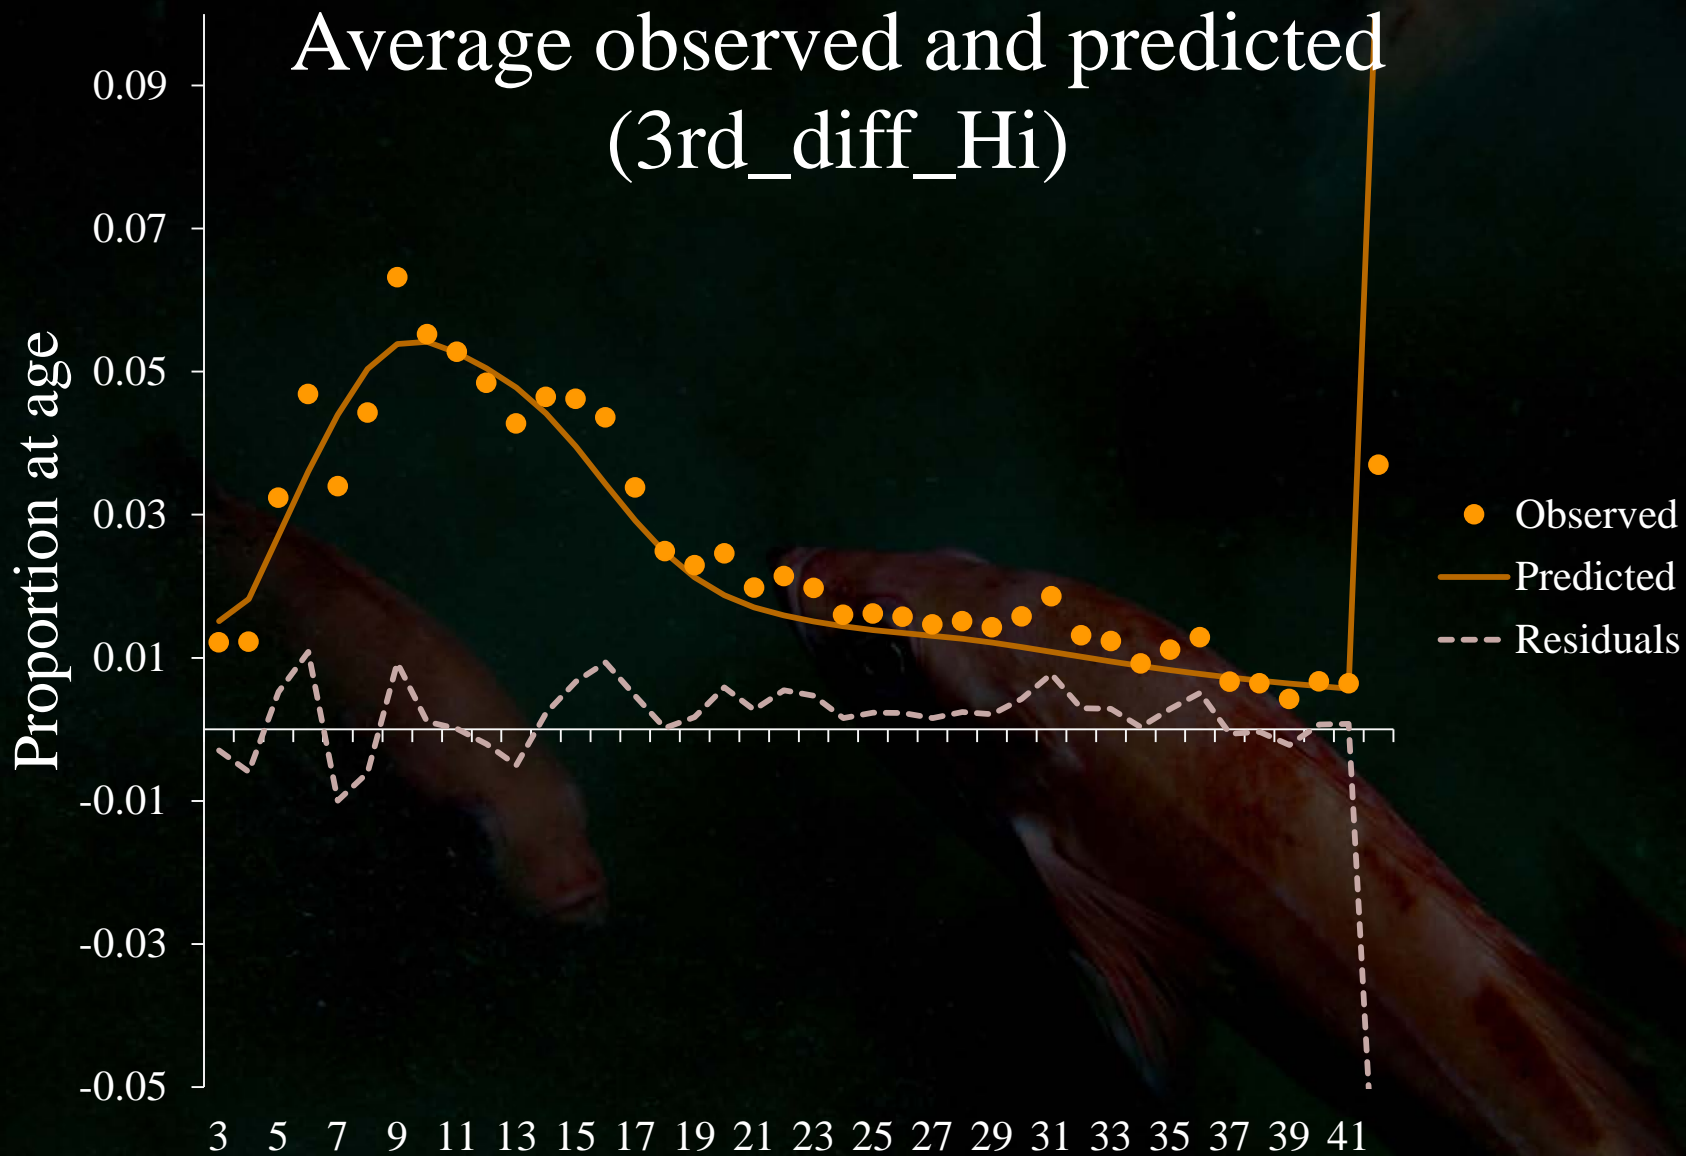

- Number of zeros in age comps
- Graphs of plus group size by fish/survey
- Graphs of average age fit to predicted
- Looked at SDNR, not shown here

Proportion in Plus Group

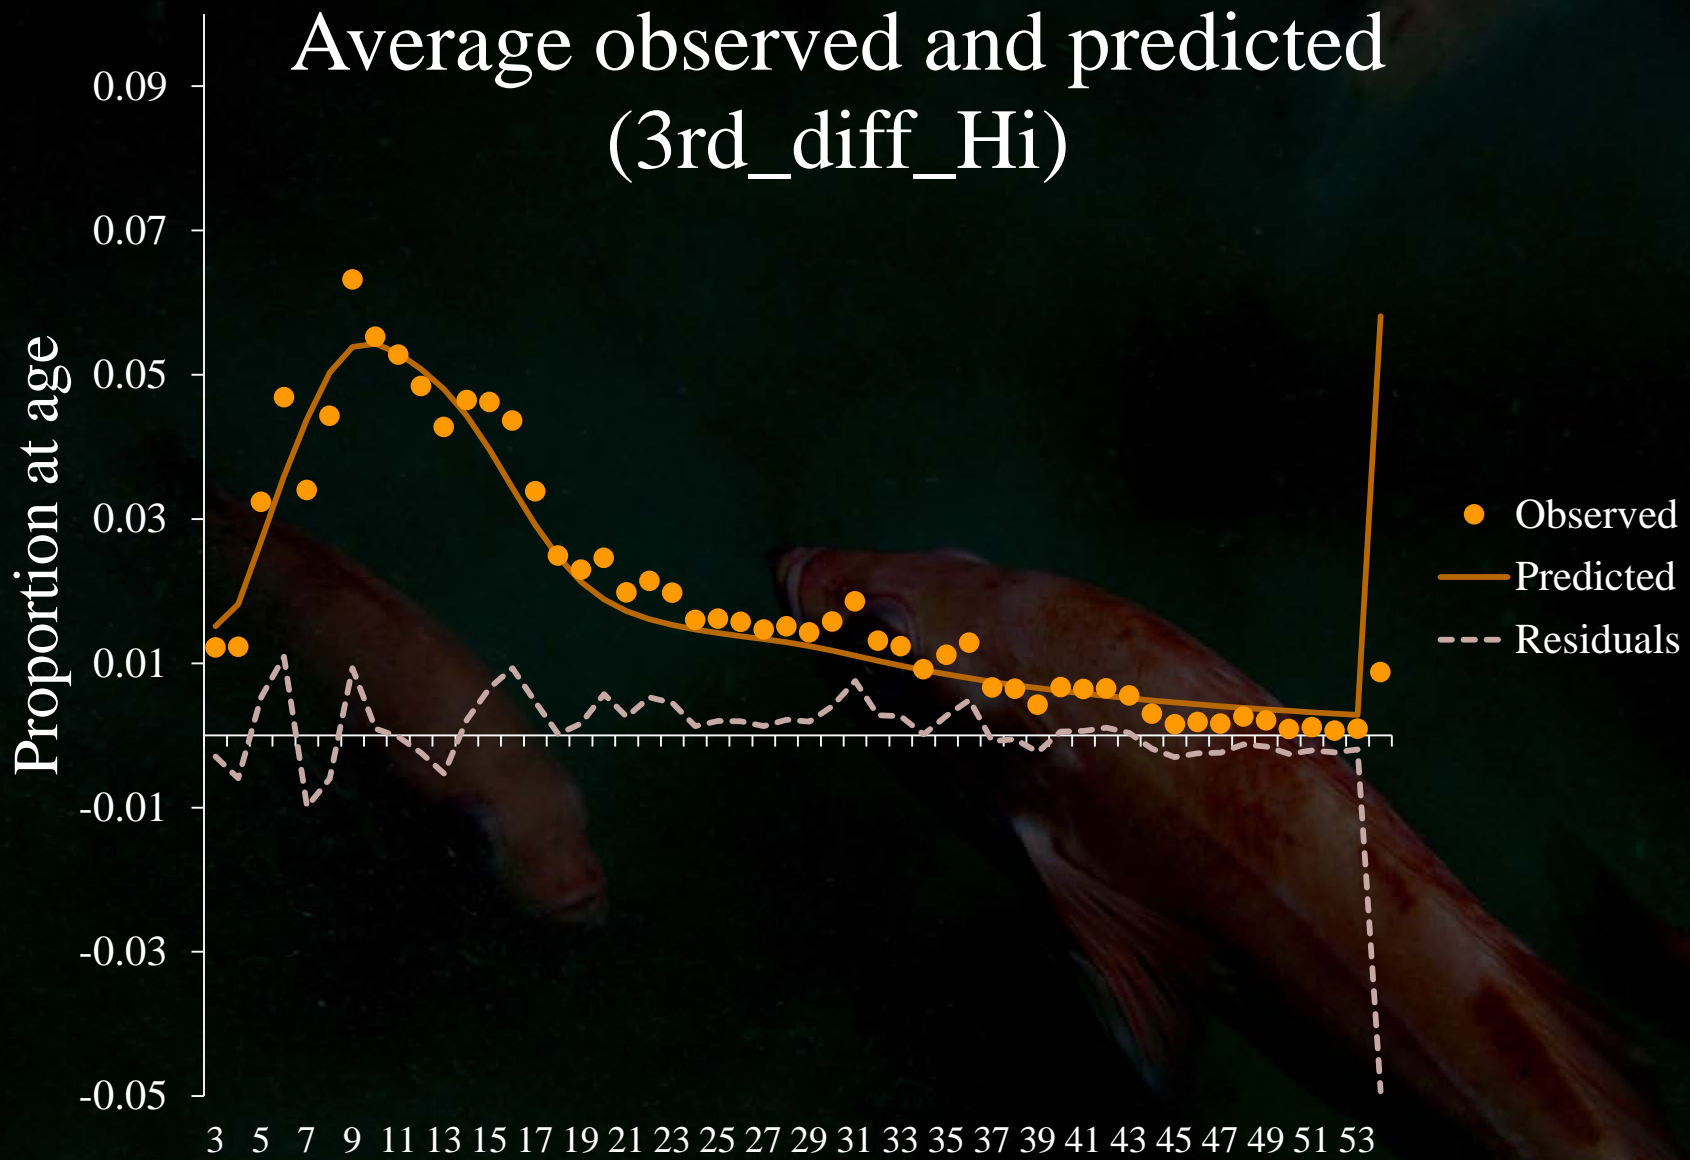

Number of Zeros in Trawl Age comp after age 25

Average observed and predicted (3rd_diff_Hi)

Average observed and predicted (gamma)

Average observed and predicted (gamma)

RE/BS Recommendation

- Fishery selects fish way older than the survey
- Trawl survey selectivity needs to be dome-shaped to some extent
- Gamma or more flexible 3rd differences
- Plus group at about 42 or greater
