Meeting overview

• Dates: September 12-13

• Participation:

- 21 Team members present
- 1 individual nominated for Team membership
- numerous AFSC and AKRO staff
- Several members of the public

- Administrative
- Bering Sea Fishery Ecosystem Plan update
- Climate/oceanography update (SSC to consider in December)
- Species-specific ecosystem and socioeconomic considerations
- Recruitment Processes Alliance surveys
- EBS/GOA 2017 longline survey
- GOA 2017 bottom trawl survey
- GOA 2017 acoustic survey
- Ecosystem monitoring and assessment studies
- Observer program (has its own agenda item)

- Untrawlable habitat research
- VAST model of survey biomass
- New assessment frequency
- Sablefish spatial model
- BSAI flatfish CIE reviews
- Marine mammal update
- Halibut discard mortality rates (after GOA specs)
- Economic SAFE (SSC to consider in February)
- Amendment 91 and Pacific cod fisher questions

- Administrative
- Bering Sea Fishery Ecosystem Plan update
- Climate/oceanography update (SSC to consider in December)
- Species-specific ecosystem and socioeconomic considerations

GOA 2017 bottom trawl survey

- 2/3 survey boats funded in 2016
- 536 stations target = 550 3-vessel target = 825
- All depth strata except 700-1000 m
- Small sample sizes in some strata may increase uncertainty
 - particularly for POP and pollock
- The Teams recommend that the survey group examine the effect of 2/3 survey effort on the precision of the biomass

It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

- Design-based survey biomass estimates were compared to those from Thorson's "VAST" geostatistical model
 - VAST already used for west coast groundfish, GOA dusky
- Questions for this analysis of GOA and AI trawl survey data:
 - How do the two methods compare?
 - Does VAST produce estimates with greater precision?
 - How does the number of knots influence trend and scale?
 - How does the specification of intercept and autocorrelation influence the estimates?
 - How does VAST compare to apportionment estimates produced from the Tier 5 random effects model?

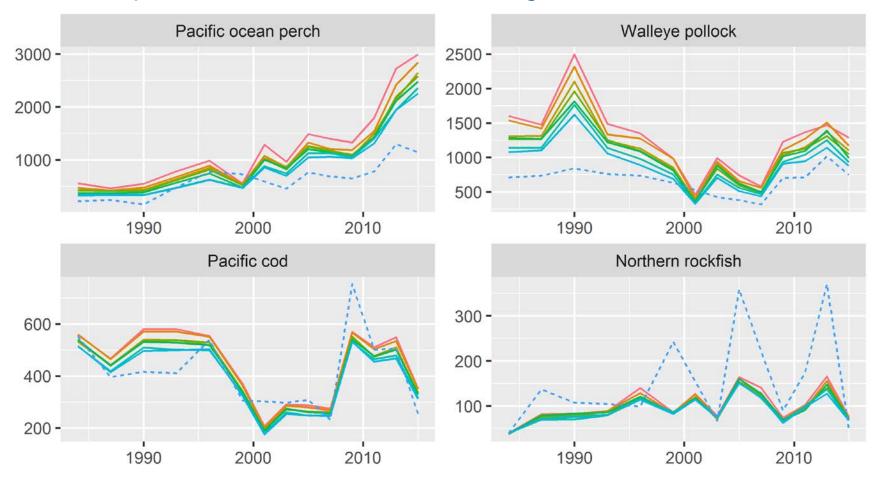

- Results for the GOA survey: point estimates of biomass
 - Much less annual variation was observed in the VAST model for northern and harlequin rockfish, spiny dogfish
 - Pacific cod and big skate showed little difference
 - For Dover sole, POP, pollock, and ATF, the estimates for the VAST model were larger, but decreased with an increase in the number of knots
 - However, trend was independent of number of knots
 - Are larger estimates from VAST due to extrapolation over the entire grid, while the design-based estimates are computed over the surveyed area only?

It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

SSC requested (2/17) that the following analyses *prior to the new assessment schedule*:

- 1. An evaluation of how projected OFL-to-ABC buffers should increase in the intervening years between full assessments
- 2. Development of a framework for evaluating the costs and benefits of changing the target frequency for the affected stocks and complexes
- 3. A more quantitative evaluation of the potential risks of changing the target frequency of the GOA flatfish stocks to a four-year cycle

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 25 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

- Team discussion:
 - None of the requested analyses have been undertaken
 - AFSC has already proceeded with the new schedule
 - Therefore, it is impossible to fulfill the SSC's request to have the three analyses completed prior to implementation of the new assessment schedule

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 26 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

It may be possible to fulfill the Council's request to have analyses #2 and #3 completed prior to proceeding with the *second* year of the new assessment schedule, but:

- The time needed to complete these two analyses may very well exceed the small amount of time freed by switching to the new schedule
- Qualitatively, the risks associated with switching to the new schedule would appear to be low

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 27 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

The minutes of the Joint Teams' January meeting show that stocks or complexes were not recommended for moving to a lower assessment frequency unless the following three criteria were met:

- The average annual change in biomass was low
- The average ratio of catch to ABC was low
- The importance to the fishery was low

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 28 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

- With all due respect, the Teams recommend that the Council reconsider the need for the two analyses that were requested to be completed prior to proceeding with the second year of the new assessment schedule
- The SSC also developed a list of research areas which it said could be addressed as a result of decreasing the assessment workload of the affected authors
- The Council then asked that the Teams refine that list during their 2017 meetings
- The Teams reviewed the list and had no recommendations for changes

- Untrawlable habitat research
- VAST model of survey biomass
- New assessment frequency
- Sablefish spatial model
- BSAI flatfish CIE reviews
- Marine mammal update
- Halibut discard mortality rates
- Economic SAFE (SSC to consider in February)
- Amendment 91 and Pacific cod fisher questions

BSAI flatfish CIE reviews

- BSAI Kamchatka flounder, arrowtooth flounder, and flathead sole
- Specific Team suggestions:
- Authors provide a response document for either for the Nov 2017 or Sept 2018 Team meeting
- A response document for all future AFSC CIE reviews

Economic SAFE report

- Economic SAFE report will be updated in November
- Stock- and complex-specific economic performance reports (EPRs) will be part of that update
- Rockfish and flatfish EPRs will be *added* this year
- The Teams recommend: Authors continue to have discretion as to whether EPRs are included in assessment text or as appendices
- Each SAFE Introduction will include a paragraph that describes where EPRs can be found for different species

VAST model of survey biomass

- Results for the GOA survey: point estimates of biomass
 - Much less annual variation was observed in the VAST model for northern and harlequin rockfish, spiny dogfish
 - Pacific cod and big skate showed little difference
 - For Dover sole, POP, pollock, and ATF, the estimates for the VAST model were larger, but decreased with an increase in the number of knots

VAST model of survey biomass

• The Teams recommended investigation of a number of technical issues for future analyses:

SSC requested (2/17) that the following analyses *prior to the new assessment schedule*:

- 1. An evaluation of how projected OFL-to-ABC buffers should increase in the intervening years between full assessments
- 2. Development of a framework for evaluating the costs and benefits of changing the target frequency for the affected stocks and complexes
- 3. A more quantitative evaluation of the potential risks of changing the target frequency of the GOA flatfish stocks to a four-year cycle

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 58 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

- Team discussion:
 - None of the requested analyses have been undertaken
 - AFSC has already proceeded with the new schedule
 - Therefore, it is impossible to fulfill the SSC's request to have the three analyses completed prior to implementation of the new assessment schedule

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 59 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

It may be possible to fulfill the Council's request to have analyses #2 and #3 completed prior to proceeding with the *second* year of the new assessment schedule, but:

- The time needed to complete these two analyses may very well exceed the small amount of time freed by switching to the new schedule
- Qualitatively, the risks associated with switching to the new schedule would appear to be low

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 60 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

The minutes of the Joint Teams' January meeting show that stocks or complexes were not recommended for moving to a lower assessment frequency unless the following three criteria were met:

- The average annual change in biomass was low
- The average ratio of catch to ABC was low
- The importance to the fishery was low

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 61 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

- With all due respect, the Teams recommend that the Council reconsider the need for the two analyses that were requested to be completed prior to proceeding with the second year of the new assessment schedule
- The SSC also developed a list of research areas which it said could be addressed as a result of decreasing the assessment workload of the affected authors
- The Council then asked that the Teams refine that list during their 2017 meetings
- The Teams reviewed the list and had no recommendations for changes

BSAI flatfish CIE reviews

- BSAI Kamchatka flounder, arrowtooth flounder, and flathead sole
- Specific Team suggestions:
- Authors provide a response document for either for the Nov 2017 or Sept 2018 Team meeting
- A response document for all future AFSC CIE reviews

Economic SAFE report

- Economic SAFE report will be updated in November
- Stock- and complex-specific economic performance reports (EPRs) will be part of that update
- Rockfish and flatfish EPRs will be *added* this year
- The Teams recommend: Authors continue to have discretion as to whether EPRs are included in assessment text or as appendices
- Each SAFE Introduction will include a paragraph that describes where EPRs can be found for different species

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 68 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. Halibut DMRs

Notable changes:

- BSAI NPT CVs
- GOA HAL CVs
- GOA Rockfish Program (RPP) CVs

Combined groupings due to low sample size:

- BSAI HAL CVs 2 vessels observed in 2014-2016.
- GOA NPT CPs 10 vessels observed in 2014-2016.

increase 52% to 60%

increase 12% to 17%

decrease 67% to 62%

Combined with GOA

Combined with BSAI

GULF OF ALASKA GROUNDFISH ASSESSMENTS

Gulf of Alaska SAFE report

Report of the Gulf of Alaska Groundfish Plan Team meeting Sept12th-15th, 2017

GOA Plan Team Members

James Ianelli (chair) A	AFSC/REFM
Jon Heifetz (co-chair 🛛 🖌 🗚	AFSC/ABL
James Armstrong N	NPFMC
Ben Williams A	ADFG
Nat Nichols A	ADFG
Jan Rumble A	ADFG
Dan Lew A	AFSC/REFM
Chris Lunsford A	AFSC/ABL
Sandra Lowe A	AFSC/REFM
Paul Spencer A	AFSC/REFM
Craig Faunce A	AFSC/FMA
Obren Davis A	AKRO

This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

Stock Structure Template

- The Team recommended:
 - 2018 Octopus and flathead sole
 - 2019 N. rockfish and Pacific cod
 - 2020 Sculpins and thornyhead rockfish

Other rockfish

- Multi-year examination of the potential to split DSR complex out of ORX complex GOA-wide
 - Issues
 - Differences in life history
 - Availability or lack thereof to the trawl survey
- The Team Recommended
 - Author-preferred Alternative 3a to split DSR species out of the ORX complex.
 - Need clear justification for how the Tier 6 method was selected before the November meeting.
 - Red-banded rockfish remain in the ORX complex
 - Clarification on whether the Council Stock Structure and Spatial Management Policy applies to the proposed changes to the ORX complex

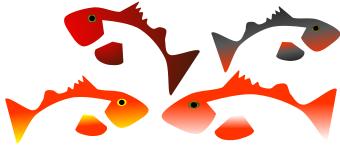

- Thomas Farrugia (PhD student) presented agestructured assessments longnose and big skates
- Tier 5 will continue for 2018 fishing year
- Possible use for 2019 specifications

Pacific ocean perch

Four areas of research presented:

- 1. Length composition data
- 2. Input sample sizes used for age and length composition data
- 3. Fishery selectivity
- GLMM alternative to the design based estimates currently used for the bottom trawl survey index

DSR/yelloweye rockfish

 Density estimates for yelloweye rockfish increased in 2016 and 2017 so biomass has increased by ~50 t.

 Age-structured assessment has been delayed due to staffing changes and will be presented in 2018.

Pacific cod

Topics covered:

- 1. How to deal with length composition proportioning
- 2. Exploration of the VAST model for survey indices
- 3. Examination of temperature based catchability.

Pcod recommendations

- Pot fishery monitoring low
 - Work with State on linking state port sampling data with fish tickets for length compositions
- Continue with the design-based estimates
 - More work needed for VAST model
 - Incorporating temperature-based catchability seems interesting and "experimental"
 - More examination during a pending CIE review.

GOA flatfish

- Rex sole
 - Evaluated splitting and combine length data
 - New data dramatically reduced F40% values from previous assessments
- Rock soles
 - Alternative data weighting methods
- Arrowtooth flounder
 - The Team agrees with the planned proposed work on data weighting, estimating the conversion matrix, and modeling natural mortality as a function of weight.

Walleye pollock

Summary of the CIE review that was conducted in May 2017

- An appendix expected in Nov describing responses
- Conflicting survey data
 - Acoustic trawl surveys are up
 - Bottom trawl surveys down

GOLF OF ALASKA GROUNDFISH ASSESSMENTS GOLF OF ALASKA GROUNDFISH ASSESSMENTS

For GOA

- Based on EBFM roadmap (HQ).
- Led by Martin Dorn

Climate Science Strategy has 4 areas of activity:

- Long-term monitoring
- Process studies
- Risk assessment
- Modeling climate impacts and management scenarios

AFSC research contributes to these 4 areas.

- OY range for GOA
- Biological reference points for status determination
- Community level social and economic impacts of climate change.

GOA Harvest specifications for 2018/2019

 The Team recommended rolling over the 2018 GOA final harvest specifications for OFLs and ABCs (as published in the Federal Register in February 2017) for the proposed 2018 and 2019 OFLs and ABCs.

Other issues

 General concern about drop in survey coverage (530 stations instead of 850)

Team vacancies

- WDFW
- Marine Mammal expert
- USFW (Seabird expert)
- IPHC and
- NMFS Headquarters

Agenda (action items in red)

- Administrative
- EBS pollock update
- Bering Sea Pacific cod preliminary assessment
- BS/RE rockfish stock structure/spatial management
- BSAI sculpin stock structure
- Stock structure template
- Harvest specifications for 2018/2019

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 88 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

BS Pacific cod preliminary assessment

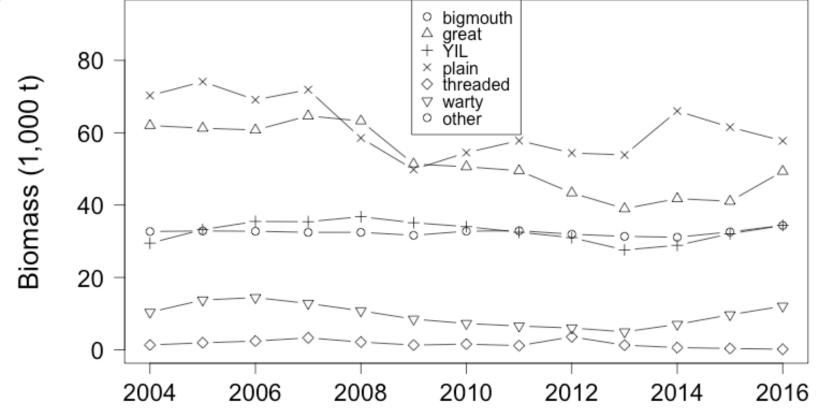

- 2018 meeting of the Pcod Models Subcommittee TBD November
- Recommend models 16.6 and 17.6 for the final Pacific cod assessment
 - Note SSC added 17.1, 17.2 and 17.3 as well

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 89 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

BSAI sculpin stock structure

Biomass trends of the six most abundant sculpins have been mostly stable, although some decline is apparent in great, plain, and butterfly sculpin

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 90 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines.

It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

BSAI sculpin stock structure

- Aggregated catch of sculpin species in the EBS and the AI has also been stable since 2004
- Differences in growth were observed among yellow Irish lord between the EBS and the AI
- Growth and length differences have not been examined for other sculpin species in the BSAI, but differences have been observed for great sculpin in Kamchatka

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 91 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

BSAI sculpin stock structure: conclusions

- Recommend that a rating of "little or no concern" be conferred upon the BSAI sculpin complex
- The Team recommends that future assessments consider the following two requests:
 - 1. Determine if there was a change in the quality of species identification around 1998
 - large change in biomass for a number of the species
 - 2. Aleutian Islands survey data prior to 1991 may not be comparable to survey data after 1986, and should be noted as separate time series or omitted entirely

Stock structure template

- For September 2018:
 - Bogoslof pollock
 - Greenland turbot
 - Northern rock sole

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 93 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

Harvest specifications for 2018/2019

 Recommends adoption of the proposed 2018/2019 BSAI OFLs and ABCs for the purpose of notifying the public of potential final harvest specifications

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 94 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines. It has not been formally disseminated by the National Marine Fisheries Service and should not be construed to represent any agency determination or policy.

Harvest specifications for EBS Pacific cod

- Post-meeting analysis—preliminary 2018/2019 OFL and ABC for EBS Pacific cod based on a Tier 5 approach using the 2017 EBS shelf bottom trawl survey point estimate:
 - Biomass=598,260 t (down 37% from 2016)
 - OFL=215,374 t, ABC=161,530 t

U.S. Department of Commerce | National Oceanic and Atmospheric Administration | NOAA Fisheries | Page 95 This information is distributed solely for the purpose of pre-dissemination peer review under applicable information quality guidelines.
