# Economic Impacts of Reducing BSAI Halibut PSC Limits 

Presentation to the

## North Pacific Fishery Management Council

Marcus L. Hartley<br>June 4, 2015

## Presentation Outline

- Highlight changes in the RIR
- General assumptions about the IMS model
- Impacts for groundfish
- Response to reduced PSC limits
- Impacts in yield to halibut fishery

## Changes to the RIR in Chapter 4

- Clarified assumptions in the model
$\square$ Methodology in 4.6 (p 228), assumptions in 4.6 .3 (p 265)
- Assessment of impacts aggregated over all percentage reduction options, details moved to Appendix D
- Average annual future revenues reported, as well as 10 year sum
- Enhanced discussion of groundfish impacts

■ Estimates of crew member involvement \& impacts (4.4 \& 4.8-4.12)
$\square$ Implications of PSC Reductions on Optimum Yield (4.8-4.12)
$\square$ Catch progressions lines comparing wholesale revenues and halibut PSC by sector and target fishery in existing conditions sections and in impacts section (4.4.2-4.4.6 \& 4.8-4.12)

- Improved discussions of behavioral changes (4.8-4.12 \& Appx B)

## Changes to the RIR in Chapter 4

■ Halibut fishery impacts by sector and across

- Changes in the process to estimate FCEYs \& harvest

■ Explicit modeling of U26 impacts coastwide

- Methods described in 4.6.1.2, beginning p. 236
- Impacts summarized for: 1) Area 4 (BSAI), 2) GOA (Other AK), 3) BC and US West Coast (External Areas)
- Community analysis for groundfish and BSAI halibut communities
- Appendix $C$, and summarized in 4.13

## General assumptions regarding the IMS Model

1. Impacts of limit reductions can be modelled using 2008-2013 as basis years to represent future years from 2014 to 2023; initial PSC cuts occur in 2014, and initial halibut increases in 2015

■ Using 2008-2013 as the basis years implies that for groundfish, all ABCs, TACs, PSC limits and apportionments, harvests, prices and revenues (both ex-vessel and wholesale) can be used to represent the future under the status quo
■ With reductions in groundfish harvests to comply with new PSC limits the basis year can also represent future years under the "change case"
■ "Impacts" of the proposed PSC Limit reductions are calculated as the difference between the status quo and the change case

## General assumptions regarding the IMS Model

2. Future halibut biomass is fixed at 2014 IPHC levels with future fishery yield increases resulting from changes in PSC, augmented with yield increases from U26 savings. Other yield factors held constant.

- For purposes of the model only, biomass is assumed to remain constant in future. This allows the analysis to focus on the changes specific to PSC reductions.
- The model applies what would approximate the IPHC blue line yield recommendations. Because of the retrospective bias adjustments, these are different than existing conditions-IPHC is not bound by the blue line, and in 2014 \& 2015, they exceeded it.
- IMS Model use of the "Blue Line" can result in negative FCEYs

## Future Initial Area Specific Yield and Fishery Yields under the Status Quo in the IMS Model

|  | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 |

See Table 4-123 on page 274.

## General assumptions regarding the IMS Model

3. Future groundfish PSC, harvest, and revenue in the status quo and the change case use a random selection (with replacement) of basis years with reductions imposed only if PSC exceeds the new limit in the base year; noting that PSC is independent of biomass, and that the same basis years are used for both the SQ and change cases

- Tables prepared for each sector indicate the basis years in which the PSC reduction affects harvest and how much PSC will be reduced in that year
- Similar tables show how much wholesale revenue is reduced in each basis year

4. 10,000 independent iterations are run for each of two scenarios (A \& B) for each reduction sub-option. Scenario $A$ is a lower impact case than Scenario B, noting that scenarios are mutually independent

Table 4-126. Halibut PSC Cuts in Each Basis Year from A80-CP Target Fisheries, by Suboption and Scenario (p. 285)

## Impacts for Groundfish Fisheries

- The "Super Summary" table in the executive summary (p. 22 and also in Section 4.13 on p. 359) contains all of these results.
- Tables in the impacts section for each sector also report these outcomes
$\square$ Amendment 80 (Option 1) and BSAI TLA (Option 2): all PSC options would have been constraining in some of the years 2008-2013, and are likely to be constraining in some future years
- Pacific cod longline CPs (Option 3): only reductions of $30 \%$ or higher would be likely to constrain the fishery in the future
$\square$ Pacific cod longline CVs (Option 5) and Other longline fisheries (Option 4) would not be affected by any of the reduction options
- CDQ groups (Option 6): only reductions of $35 \%$ or higher would be likely to constrain the CDQ groundfish fishery in the future, unless growth continues at its current rate

## Impacts to Amendment 80 Cooperative Fisheries

- Scenario A assumes they use historic fleet-wide data from the basis years, to determine collectively which fisheries (by target, month and management area) must be off limits. We assume strict compliance and that there are no barriers that limit transfers of PSC and groundfish among or across cooperatives
- Scenario B assumes there is some friction in PSC transfers-each company retains up to five percent more PSC than they need as a buffer for unexpected bycatch events. Each company has their own limit and each make individual decisions based on company data to determine the months that all of the companies' vessels will operate. No assumptions are made regarding the de-activation of individual vessels.
- Two other methodologies, last-caught-first-cut and perfect knowledge, are estimated, but not used because the analysts felt they were less likel for A80 vessels. The analysts recognize that other strategies to mitigate impacts of PSC limit reductions could be employed by the A80 fleet.

## Example catch progression lines for A80-CPs for basis year 2013

See Figure 4-63 on page 255

## Impacts on A80-CPs based on average annual values (p. 288) - numbers in Table 4-127 p. 286

## Impacts to A80 CPs - Table 4-128, p 289

- The average annual values are a useful illustration of the impacts, but they hide the considerable inter-annual variability that are contained in the full IMS model runs. (Appendix D contains statistical details and histograms of outcomes over the 10,000 iterations in each model run.)

| Year | DPV of Wholesale Revenue Under the Status Quo Scen. A - B | 1a: -10\% | 1b: -20\% | 1c: $-30 \%$ | 1d: -35\% sent Value of | 1e: -40\% | 1f: -45\% ue Under the A | 1g: -50\% |

## Target Fishery Impacts for A80-CPs under Scenarios A \& B with $30 \%$ and $50 \%$ PSC Limits Reduction Options

Percent of Status Quo Harvest by Target Fishery with a 30\% PSC Limit Reduction
$■$ Scenario A Scenario B

0\% 20\% 40\% 60\% $40 \%$

Percent of Status Quo Harvest by Target Fishery with a 50\% PSC Limit Reduction
$\square$ Scenario A $\quad$ Scenario B

## A80 harvest impacts by target fishery

■ Impacts under a 50\% reduction range from 16-28\% under Scenarios A-B
■ Sorted by target fishery volume of harvest:

- Yellowfin sole: reductions from 19-35\%
$\square$ Atka mackerel: reductions from 0.2-24\%
■ Rock sole: reductions from 17-18\%
- Arrowtooth/Kamchatka: reductions from 29-48\%

■ Flathead sole: reductions from 29-57\%

- Rockfish: reductions from 4-28\%
$\square$ Pacific cod: reductions from 20-25\%
$\square$ All other targets: reductions from 21-29\%

## Estimates of A80 crew member involvement and impacts

- Data on crew members on board are provided in the catch accounting system from 2009 forward from AKFIN for groundfish vessels
- EDR data for A80-CPs provides crew payment and total crew counts for A80-CPs.
- Also describes crew members for two vessel types:
- Vessels that focus on Atka mackerel
- Vessels that focus on flatfish
$\square$ (See p. 290)

## A80 crew impacts - p. 290, Tables 4-130,131

|  |  | $\mathbf{5 0 \%}$ Cut in PSC Limits |  |
| :--- | :---: | :---: | ---: |
|  | Status Quo | Scenario A | Scenario B |
| Vessel Type | Impacts on Annual Average Payments to Crew |  |  |
| Atka Mackerel Focus | $\$ 32.17$ | $(\$ 3.25)$ | $(\$ 6.45)$ |
| Flatfish Focus | $\$ 38.87$ | $(\$ 6.92)$ | $(\$ 12.51)$ |
| All A80-CPs | $\$ 71.04$ | $(\$ 10.17)$ | $(\$ 18.96)$ |

## Impacts by Vessel Type on Wholesale Revenues

|  | Status Quo | 50\% Cut in PSC Limits |  |
| :--- | :---: | :---: | ---: |
| Scenario A | Scenario B |  |  |
| Vessel Type | Impacts on Annual Average Wholesale Revenue |  |  |
| Atka Mackerel Focus | $\$ 118.18$ | $(\$ 11.94)$ | $(\$ 23.69)$ |
| Flatfish Focus | $\$ 142.77$ | $(\$ 25.42)$ | $(\$ 45.96)$ |
| All A80-CPs | $\$ 260.95$ | $(\$ 37.36)$ | $(\$ 69.65)$ |

## Impacts to Amendment 80 Limited Access: <br> Option 1 Suboption 2 (see Section 4.8.2 on p. 299)

■ No way to know in advance which vessels, if any, will choose to enter the limited access fishery
■ Adopting a more severe PSC limit reduction for vessels participating in limited access would provide an additional disincentive to leave cooperatives.
■ Given that the A80 Limited Access fishery could devolve into a race for fish, it is much more likely that halibut encounter rates will be higher than under an A80 cooperative with similar PSC levels.

## LGL-CPs Scenarios

## - Same scenarios as A80: sector operates in a cooperative

$\square$ Scenario A assumes they use historic fleet-wide data from the basis years, to determine collectively which fisheries (by target, month and management area) are must be off limits. We assume strict compliance and that there are no barriers that limit transfers of PSC and groundfish among or across cooperatives

- Scenario $B$ assumes there is some friction in PSC transfers-each company retains up to five percent more PSC than they need as a buffer for unexpected bycatch events. Each company has their own limit and each make individual decisions based on company data to determine the months that all of the companies' vessels will operate. No assumptions are made regarding the de-activation of individual vessels

## Impacts of on LGL-CPs based on annual average values (p. 330) - numbers in Table 4-161 p 328

with Average PSC Reduction Amounts Color Coded by Option

## Target Fishery Impacts for LGL-CPs under Scenarios A \& B with $30 \%$ and $50 \%$ PSC Limits Reduction Options

## Estimates of LLCP crew member involvement and impacts

- No official data on crew shares, or crew member home towns or the total number of crew persons used during the year, except from A80.
■ The analysis uses A80-CP data combined with AKFIN crew counts, along with the judgment and experience of the analysts to estimate crew payments and total crew employment counts

## LGL-CP crew impacts - p. 332

| Status Quo | $\mathbf{5 0 \%}$ Cut in PSC Limits |  |
| :---: | :---: | ---: |
| Scenario A | Scenario B |  |
| Impacts on Annual Average Payments to Crew |  |  |
| $\$ 32.17$ | $(\$ 3.25)$ | $(\$ 6.45)$ |
| $\$ 38.87$ | $(\$ 6.92)$ | $(\$ 12.51)$ |
| $\$ 71.04$ | $(\$ 10.17)$ | $(\$ 18.96)$ |

## Impacts on BSAI TLA Fisheries

- Target fishery apportionments of the PSC limit for BSAI TLA continue to be used: a) Pacific cod; b) Yellowfin sole; c) Rockfish; and d) Pollock|AtkaM|Other Species
- Under both Scenario A and Scenario B, the rockfish apportionment (currently at 5 mt ) is assumed to be unchanged by the limit reduction
- The IMS model also assumes that the pollock target fishery remains exempt from the PSC limit
- The model incorrectly assumed that the Atka mackerel fishery within the Pollock|AtkaM|Other apportionment is constrained by the PSC Limit.
- Cuts to the BSAI TLA Atka Mackerel fishery should not have been made.

## BSAI TLA Fisheries Scenarios

■ Under Scenario A (which generates lower impacts overall) the Pollock|Atka Mackerel|Other Species PSC apportion is reduced along with PSC apportionments for Pacific cod and yellowfin sole

- Under Scenario B (which generates higher impacts overall) the Pollock|Atka Mackerel|Other Species PSC apportion is held constant (since the pollock fishery is exempt from closures), and PSC apportionments for Pacific cod and yellowfin sole see proportionally greater reductions

## Regulations regarding the setting of BSAI TLA apportionments of halibut PSC

■ (B) Fishery categories. NMFS, after consultation with the Council and after subtraction of PSQ reserves and PSC CQ assigned to Amendment 80 cooperatives, will apportion each PSC limit set forth in paragraphs (e)(1)(i) through (vii) of this section into bycatch allowances for fishery categories defined in paragraph (e)(3)(iv) of this section, based on each category's proportional share of the anticipated incidental catch during a fishing year of prohibited species for which a PSC limit is specified and the need to optimize the amount of total groundfish harvested under established PSC limits.
■ On June 3, 2015, NMFS made a "determination" that Scenario A is unlikely to actually be approved in the annual specification process, unless in fact the halibut PSC in the Pollock|Atka Mackerel|Other Species target fishery had consistently reduced its PSC "voluntarily" to levels that have been assumed for Scenario A.

## Halibut PSC in AFA Pollock Fishery appears to

 be declining since 2012

■ 2015 data are preliminary through May 31, 2015

- The declining trend makes Scenario A somewhat more plausible at least for PSC limit reductions up to 40 percent

## BSAI TLA PSC Apportionments under the subOptions and Scenarios

|  | SQ | 10\% | 20\% | 30\% | 35\% | 40\% | 45\% | 50\% |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Target Fishery | Scenario A: Assumed BSAI TLA PSC Apportionments when the Base Year is 2013 |  |  |  |  |  |  |  |
| Pollock\|Atka M.|Other | 250.0 | 224.9 | 199.7 | 174.6 | 162.0 | 149.4 | 136.9 | 124.3 |
| Pacific Cod | 453.0 | 407.4 | 361.9 | 316.3 | 293.5 | 270.8 | 248.0 | 225.2 |
| Yellowfin Sole | 227.0 | 150.2 | 133.4 | 116.6 | 108.2 | 99.8 | 91.4 | 83.0 |
| Rockfish | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 |
|  | Scenario B: Assumed BSAI TLA PSC Apportionments when the Base Year is 2013 |  |  |  |  |  |  |  |
| Pollock\|Atka M.|Other | 250.0 | 250.0 | 250.0 | 250.0 | 250.0 | 250.0 | 250.0 | 250.0 |
| Pacific Cod | 453.0 | 389.1 | 325.1 | 261.2 | 229.2 | 197.3 | 165.3 | 133.3 |
| Yellowfin Sole | 227.0 | 143.4 | 119.9 | 96.3 | 85.9 | 74.1 | 62.3 | 50.5 |
| Rockfish | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 | 5.0 |

## BSAI TLA Fisheries Scenarios

- Under both Scenario A and Scenario B, the Pacific cod fishery is assumed to be a race for fish, and PSC reductions are achieved in a last-caught, first-cut methodology
■ Under Scenario A, the yellowfin sole fishery is assumed to be rationalized. Participants determine the order in which months and NMFS areas should be placed off limits in order to reduce their PSC to the new lower limit, while mitigating as much as possible the negative revenue impacts
■ Under Scenario B, the yellowfin sole fishery is assumed to be a race for fish, and PSC reductions are achieved in a lastcaught, first-cut methodology

## Example catch progression lines for BSAI TLA Pacific cod for 2012 (see Fig 4-76 p. 306)

- Because PSC limits change between the two scenarios, a more comprehensive graphic could not be developed

## Example catch progression lines for BSAI TLA Pacific cod for 2012 (see p. 306)

- Because PSC limits change between the two scenarios, a more comprehensive graphic could not be developed

## Example catch progression line for BSAI TLA Yellowfin Sole under Scenario A for 2012

- Because PSC limits change between the two scenarios, a more comprehensive graphic could not be developed
■ Figure $4-75$ on p. 306

## Target Fishery Impacts for the BSAI TLA under Scenarios A \& B with $30 \%$ and $50 \%$ PSC Limits Reduction Options

## BSAI TLA harvest impacts by target fishery

- Impacts under a $50 \%$ reduction range from 1.6-3.4\% under Scen. A-B; excluding pollock, range is 21-46\%
■ Sorted by target fishery volume of harvest:
$\square$ Pacific cod: reductions from 24-48\%
- Yellowfin sole: reductions from 17-47\%
- Atka mackerel: Modelled reduction of 49\% under Scenario A, no impact under Scenario B. These reductions are in error.
- Pollock: no direct impacts
- Rockfish: no impacts

## Estimates of BSAI TLA crew member involvement and impacts

- The analysis uses A80-CP data combined with AKFIN crew counts, along with the judgment and experience of the analysts to estimate crew payments and total crew employment counts
■ Estimates for BSAI TLA crew member subgroups: (p 313-4)
- Diversified AFA-CPs
- Non-Diversified AFA-CPs
- Diversified AFA-CVs
- Non-Diversified AFA-CVs
- Non-AFA Trawl CVs

## Crew Impacts by BSAI TLA Vessel Type

## See Table 4-146 to 4-151 on pp. 312-314

|  |  | 50\% Cut in PSC Limits |  |  |
| :--- | :--- | ---: | ---: | ---: |
| Vessel Group | Target Fisheries | Status Quo | Scenario A | Scenario B |
| Non-Diversified CPs | Pollock Only | $\$ 37.98$ | $(\$ 0.03)$ | $(\$ 0.01)$ |
| Diversified CPs | Pollock \& Yellowfin Sole + | $\$ 77.40$ | $(\$ 0.67)$ | $(\$ 2.07)$ |
| Non-Diversified CVs | Pollock Only | $\$ 44.99$ | $(\$ 0.01)$ | $(\$ 0.01)$ |
| Diversified CVs | Pacific cod and Pollock (usually) | $\$ 28.64$ | $(\$ 1.11)$ | $(\$ 2.50)$ |
| Non-AFA Trawl CVs | Pacific cod and/or Yellowfin Sole | $\$ 2.93$ | $(\$ 0.92)$ | $(\$ 1.42)$ |
| All BSAI TLA Vessels | All BSAI TLA Targets | $\$ 191.94$ | $(\$ 2.74)$ | $(\$ 6.01)$ |

## Revenue Impacts by BSAI TLA Vessel Type

- This table was developed in response to discussions in the AP and does not appear in the document.
- Wholesale revenues are provided for CPs, and Ex-vessel Revenues for CVs

|  |  | $50 \%$ Cut in PSC Limits |  |  |
| :--- | :--- | ---: | ---: | ---: |
| Vessel Group | Target Fisheries | Status Quo | Scenario A | Scenario B |
| Non-Diversified CPs | Pollock Only | $\$ 37.98$ | $(\$ 0.03)$ | $(\$ 0.01)$ |
| Diversified CPs | Pollock \& Yellowfin Sole + | $\$ 77.40$ | $(\$ 0.67)$ | $(\$ 2.07)$ |
| Non-Diversified CVs | Pollock Only | $\$ 44.99$ | $(\$ 0.01)$ | $(\$ 0.01)$ |
| Diversified CVs | Pacific cod and Pollock (usually) | $\$ 28.64$ | $(\$ 1.11)$ | $(\$ 2.50)$ |
| Non-AFA Trawl CVs | Pacific cod and/or Yellowfin Sole | $\$ 2.93$ | $(\$ 0.92)$ | $(\$ 1.42)$ |
| All BSAI TLA Vessels | All BSAI TLA Targets | $\$ 191.94$ | $(\$ 2.74)$ | $(\$ 6.01)$ |

## Impacts on CDQ fisheries - Scenarios

- Under Scenario A, it is assumed that the organizations make a joint decision to rank target fisheries to determine the fisheries in which all CDQs will participate, and those that will be avoided in order for all CDQ groups to stay under the limit. The ranking is done in terms of the overall wholesale revenue per PSC for each fishery.
■ Under Scenario B, it is assumed that CDQ organizations make a joint decision to determine which fisheries must be off limits in order for CDQs as a whole to remain below the PSC limit, while cutting the groundfish harvests with high levels of halibut encounters and relatively low amounts of wholesale revenue generated.

## Impacts on CDQ Fisheries based on annual average values (p. 348) - numbers in Table 4-176 p 347

## Crew \& Revenue Impacts on Vessels in CDQ Fisheries

See Table 4-178 to on p. 349, noting that wholesale revenue portions were included as a result of discussion in the AP.

|  | 50\% Cut in PSC Limits |  |  |
| :--- | :---: | :---: | ---: |
| Vessel Type | Status Quo | Scenario A | Scenario B |
|  | Impacts on Payments to Crew |  |  |
| All AFA-CPs | $\$ 31.91$ | $(\$ 0.24)$ | $(\$ 1.16)$ |
| All A80-CPs | $\$ 4.47$ | $(\$ 0.16)$ | $(\$ 0.20)$ |
| LGL-CPs | $\$ 8.30$ | $(\$ 0.01)$ | $(\$ 0.15)$ |
| All Crew in CDQ fisheries | $\$ 44.68$ | $(\$ 0.41)$ | $(\$ 1.51)$ |
|  | Impacts on Wholesale Revenues |  |  |
| All AFA-CPs | $\$ 118.19$ | $(\$ 0.89)$ | $(\$ 4.30)$ |
| All A80-CPs | $\$ 16.42$ | $(\$ 0.59)$ | $(\$ 0.73)$ |
| LGL-CPs | $\$ 23.71$ | $(\$ 0.03)$ | $(\$ 0.43)$ |
| All Vessels in CDQ fisheries | $\$ 158.32$ | $(\$ 1.51)$ | $(\$ 5.46)$ |

## CDQ Investments in non-CDQ Groundfish

■ Table 4-73 on p. 200 summarizes CDQ ownership investments in groundfish and crab vessels operating in the BSAI

- These investments mean that CDQ groups are affected from three different perspectives:
- Negatively by PSC limit reduction options for the CDQ fishery,
- Positively by increases in commercial halibut fishery harvests
- Negatively by PSC limit reduction options in non-CDQ groundfish fisheries
■ Table 4-179 on p. 349 summarize the impacts to CDQ groups from PSC reductions in non-CDQ groundfish fisheries

## Foregone Revenue Impacts on CDQ Organizations in Options Affecting other Sectors

| Sector | 10-year DPV of Wholesale Revenue of CDQ Vessel Assets Under Status Quo <br> Scen. A - B | 35\% Limit <br> Reductions | 40\% Limit Reductions | 45\% Limit Reductions | 50\% Limit Reductions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 10-Year Forgone Discounted Present Value of Revenue Under the Alternatives Incurred by Vessel Assets Owned by CDQ Organizations |  |  |  |
|  |  | Scen. A - B | Scen. A - B | Scen. A - B | Scen. A - B |
| A80-CPs | \$37.6 | \$2.6-\$6.6 | \$3.7-\$8.5 | \$4.8-\$10.7 | \$6.6-\$12.5 |
| BSAI TLA | \$853.3 | \$2.9-\$8.4 | \$3.8-\$9.6 | \$4.5-\$11.9 | \$5.4-\$16.1 |

| All | 13.03\% | 13.15-13.32\% | 13.20-13.40\% | 13.23-13.46\% | 13.26-13.50\% |
| See Table 179 on Page 349 |  |  |  |  |  |

## Impacts on Groundfish Harvests Combined Across Options (Includes Pollock)

## Impacts on Groundfish Harvests Combined Across Options (Excludes Pollock)

## Responses to PSC limit reductions (See Section 4.13.2.2 p 381)

- Behavior change can be measured in terms of groundfish harvest, halibut encounters, halibut encounter rates, and discard mortality rates
$\square$ Mathematically, this can be described as:
Halibut PSC (kg) = groundfish (mt) $\times$ halibut encounter rate $(\mathrm{kg} / \mathrm{mt}) \times$ DMR.

## Groundfish Behavioral Changes in the IMS Model

■ Modelled behavioral changes are captured in the Scenario A and in Scenario B for rationalized fisheries.

- A80 CPs when operating in cooperatives
- LGL CPs
- All groundfish CDQ fisheries
- AFA pollock fisheries in the BSAI TLA
- BSAI TLA Yellowfin sole fishery under Scenario A
$\square$ Rationalized fisheries can exert some control over which target fisheries (records) are included or are cut-these behavior changes are a key feature of the IMS Model
- Race-for-fish fisheries cannot control which records are kept or cut-PSC reductions use a last-caught first-cut process

## Groundfish Behavioral Changes in the IMS Model

- A PSC cut with no behavior change would a equate to a change in groundfish harvested, but no change in the halibut encounter rate or in the DMR.
- For example a $10 \%$ reduction in groundfish with no changes in halibut encounter rates or in the DMR would result in a 10\% reduction in PSC
- If there are behavioral changes, then we would see changes in the halibut encounter rate, or in the DMR as well as changes in groundfish
- Behavioral changes that reduce halibut encounter rates or DMRs within a given harvest record are certainly possible, but are not included in the IMS Model

## Groundfish harvest, halibut encounters, halibut encounter rates (HER), \& PSC in the BSAI TLA under limit reduction options

| Variable | Percentage Change from Status Quo Under the Suboptions |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Halibut PSC mortality ( $\Delta$ \%) | -2.9\% | -10.7\% | -21.4\% | -27.7\% | -32.7\% | -38.2\% | -44.0\% |

Table 4-205, p 382

## Appendix B evaluates other opportunities to mitigate PSC reductions

■ Josh Keaton of NMFS-AKR will summarize

## C-2 Halibut PSC Appendix B

NOAA FISHERIES<br>Alaska Region

Josh Keaton<br>Inseason Management

## Need for Appendix B

- Vessel operators typically change how they operate as they seek to maximize profits under new constraints.
- Assumption \#34 (pg 268)

The assumption that all individual vessel records are either used in their entirety or cut from the fishery to reduce PSC limits, precludes any behavioral changes that alter the halibut encounters within a given record or that increase the amount of groundfish harvested with the same amount of PSC. These types of cost-free behavioral changes are not part of the IMS Model.

Differences in scale of record
Appendix B Analysis - Vessel Haul / Daily Scale
Economic Analysis - Vessel/Month/Target/Area

## Key points

- Qualitative analysis of potential responses that could be practically implemented and may result in less impacts
- Qualitative due to lack of certainty in predicting response and success of response
- Bering Sea Only
- Some vessels have more opportunity elsewhere
- Total Halibut use; not mortality

These are complex fisheries with lots of factors that influence them. Responses to high halibut may not always result in lower halibut PSC and may result in higher incidental catches of other species.

## Amendment 80 Rates

Table 1; Page 424

## 2011-2014 Amendment 80 hauls per day / target

Figure 1; Page 429

## 2011-2014 Amendment 80 proportion of $90^{\text {th }}$ percentile hauls relative to total hauls

Figure 2; Page 430

## Reaction Analysis

An attempt was made to analyze how the fleet is currently reacting to high rate hauls and how the fleet might improve reaction.

Method: After a haul with $90^{\text {th }}$ percentile rate, subsequent two hauls checked

- If rate is higher than $90^{\text {th }}$ percentile on third haul; identified as "no reaction", else identified as "reaction"
- Third haul needs to be from same vessel, same time period, and same general area
- Why would a vessel operator not react?
- End of trip/season
- High rates on your vessel; even higher on other vessels
- A more limiting species such as Pacific cod

## Amendment 80 Vessel Specific Effects

$B$ and $Q$ have good performance in most years in avoiding high rates

## M and P had lower performance in avoiding high rates, but this has improved in recent years.

Note: Some vessels removed to protect confidentiality

## Hook-and-Line Catcher/Processors

Figure 12; Page 446

## Conclusions

- Analysis was able to detect that the vessel operators react to halibut rates, however halibut avoidance is not always the primary concern
- Analysis suggests that improvements in halibut avoidance may decrease halibut PSC.
- More consistent use of halibut avoidance in latter part of year
- Avoid high rate areas and these areas are driven by target fishery primarily
- Avoid certain targets (Arrowtooth); use flatfish flexibility (Flathead)
- Modify time of year when certain targets are pursued. (I.e. swap timing of fisheries to fish some yellowfin sole in first part of year)
- Potential of additional savings if halibut rate that triggers reaction was lower.
- Analysis notes that there are tradeoffs in halibut avoidance including impacts to incidental catch and cost to vessel operators

## Discard Mortality Rates are the third component of PSC reduction response p 383

■ Handling practices that reduce the DMR will have the same effect as a reduction in actual bycatch of the same percentage
■ In practice, however, under the current process, DMRs are based on a 10-year average of observed DMRs by target fishery
■ Currently based on actual observed DMRs from 2002-2011
$\square$ Work beginning on A80 vessels in the Alaska Seafood Cooperative to test savings from deck sorting in 2015

## Impacts to the Halibut Fishery

- Halibut fishery impacts provided by sector for each option, and also for all combined (e.g., assuming the Council implemented a consistent 10\%, 20\%, 30\% etc. reduction under each option)

## Harvest impacts to halibut fishery from reductions across all, in pounds p362

## Crew impacts for halibut fishery

■ In the halibut sections, Table 4-94 on p. 221 shows crew participation by vessel owner's region

- Northwest Alaska
- Bristol Bay, Aleutians, Pribilofs
- Other Alaska (GOA)
- Other States
- All Regions

## Increased Yields Resulting from U26 Savings

(p. 267)

- The coastwide yield increases take over the course of seven years, beginning 5 years after the U26 savings have been realized
■ This likely overestimates the benefit from U26 savings, as they would normally be expected to recruit into the fishery over a longer time period

## Example of cumulative added yield of 222 round weight mt of U26 PSC savings in 2008 (p 239)

- A total of 166.5 mt of increased yield is realized from 2013 to 2019
- Yield increases are distributed coastwide in proportion to biomass

## Impacts coastwide from U26 savings in BSAI
