QUALITATIVE SOCIAL SCIENCE APPROACHES & UTILITY FOR NPFMC PROCESSES

Courtney Carothers, Jim Fall, Mike Downs
Social Science Plan Team
11/6/2019
RATIONALE & PLAN

- **Rationale**
  - Desire by SSPT for overview of qualitative methods (& assess for SSC, Council)
  - Less familiarity with qualitative social science approaches, methods, data, analyses

- **Plan**
  - Courtney – broad overview qualitative approaches – methods
  - Jim – specific examples of utility of qualitative approaches
  - Mike – connecting to NPFMC processes, challenges & opportunities
QUALITATIVE SOCIAL SCIENCES

- High-quality science starts with foundational understanding of the approaches and assumptions that ground specific research designs and methods of data collection and analysis
  - Just as we would not use linear regression without an understanding of central limit theorem, we should not assess qualitative methods and analysis without understanding the theoretical assumptions that underlie them.
- Natural sciences tend to be unified in approach to scientific process & assumptions
- Social science disciplines have varied approaches and different assumptions
- Understanding approaches and assumptions important for understanding methodology and assessing the quality of qualitative social science methods & data
  - Many of the measures for assessing high quality natural science (e.g., experimental design, random sampling, statistical representation/generalization, and quantification) are not appropriate for assessing qualitative methods, data, and analysis.

EXAMPLE: HOW DO WE EXPECT FISHING PRACTICES CHANGE DUE TO NEW POLICY?

• Economists may approach this question from rational choice theory where all individuals make decisions in essentially the same way; assumption that individuals act to maximize their utility; collectives, sub-groups and distributional effects may not be central. A random fleet-wide survey may be appropriate methodology.

• Anthropologists may approach this from cultural relativism theory where culture and worldview fundamentally shape fishing practices and decision-making. They may also draw on theories of power and marginalization to recognize some sub-groups of fishermen or communities are likely to experience differential impacts, may be harder to engage for research purposes and may be less visible in policy processes. Ethnographic appraisal may be appropriate methodology for this question.

### Phase 1: Research Design and Data Collection

**Best Science**
- Clear statement of objectives
- Adheres to well-established scientific process
- Thorough review of literature and other relevant information
- Inquiry grounded in observation and deductive hypothesis testing about the basic principles that underlie cause and effect relationships
- Standardized methods for data collection
- **Experimental research design**
- There are standards for controlling the operation of the technique
- Replication and repetition occur or are possible to verify results
- Data gathered are objective, value-free
- Addresses policy-relevant questions

**Best Qualitative Social Science**
- Clear research purpose and questions
- **Justification of methods and research design (incl. sampling approach) are appropriate to the research questions**
- Relevant literature reviewed
- Sufficient/appropriate theoretical constructs guide inquiry
- Adequate data are gathered to identify patterns & saturation
- Variety in types of evidence gathered; evidence comes from multiple sources
- Contradictory evidence or cases are sought for comparison to understand complexity of the topic
- Research conducted in a manner sensitive to the social and cultural context in which it occurs, and in an ethical manner
- The research topic is relevant, timely, significant

EXAMPLES OF QUALITATIVE METHODS & DATA
<table>
<thead>
<tr>
<th>Methods</th>
<th>Purpose</th>
<th>Examples of Data</th>
</tr>
</thead>
</table>
| Ethnography                 | Provides in-depth characterization of people, places, or social organization, revealing operating principles, norms, or cultural logics about how the world does or ought to work | • Extensive field notes containing detailed observations alongside reflective or interpretive notes  
  • Meticulous detail on setting, space, formal and informal social rules  
  • Descriptions of how power is exercised or operates  
  • Information on pressures or ‘external’ meso- or macro-scale effects on setting  
  • Data from multiple-linked sites where needed |
| Rapid Ethnographic Assessment | For time-limited observations of routines, events (e.g., decision making fora), site uses (e.g., food harvesting) | • Short descriptive field observations  
  • Topically and temporally bounded interview data (e.g., on site and uses only);  
  • Maps with notations (e.g., in situ recordings of key locations with judgments of importance) |
| Participant observation     | Used for gathering a variety of data about people’s lives and activities, social processes and institutions, and cultural practices via direct participation, observation, and experience in order to gain in-depth understanding of a phenomenon | • Descriptions of events, activities, institutions, behavior and their meaning  
  • Photographs, videos, audio recordings |

Charnley et al. 2017
<table>
<thead>
<tr>
<th>Interviewing Type</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-Depth Interviewing</td>
<td>Addresses topics poorly served by didactic or direct questions and answers; key for individual or collective experience; meaning (e.g., experience and importance of phenomena such as pain, a hunting ritual, or wilderness). Uses big questions. Also aims to provide exposition and detail where articulacy is thin or knowledge held is ‘2nd nature’ and so less amenable to consciousness.</td>
<td>Good quality narratives of experience or explanation that are rich in impressionistic, metaphorical, or analogic detail. Has quality of ‘showing’ or ‘describing’ the phenomena in question, not telling or classifying.</td>
</tr>
<tr>
<td>Structured Interviewing (mental models)</td>
<td>Highly structured with several well-tested interview protocols used for understanding cognition or how people think about a problem (e.g., climate change). Relevant to studying beliefs about how things work, what something is, or how a system is organized and operates. Often but not solely used to confirm or disconfirm lay-expert differences.</td>
<td>Data tend to be organized into units of descriptive models (e.g., ideas about how an institution governing resource access, or a restoration practice, is thought to work and its effects), including verbal probabilities (belief in frequency, magnitude or consequences).</td>
</tr>
<tr>
<td>Semi-structured interviews</td>
<td>Similar to structured interviews except interview protocols are less structured, containing open-ended questions following a general script that covers several topics to obtain detailed information about them within a limited period of time. Allows for exploration of unexpected topics that may arise during the interview process.</td>
<td>Same as above.</td>
</tr>
</tbody>
</table>
Focus Groups

Used to address questions of what society or groups collectively want (vs. aggregation of individual opinion), where the entity of interest is the group and/or the quality of answers may be better because of group discussion. Particularly useful when a topic is new, knowledge about a topic is nascent, or information is needed for policy design and evaluation.

- Qualitative data points, indicators, and/or subjective or constructed scales where none exist (e.g., those used for place value or aesthetic importance in a restoration context);
- Thinking about new topics or technologies as they emerge (e.g., how people take up and respond to renewable energy technologies about which they know very little as yet)

Archival research

Common applications:
(a) document past social or ecological conditions; (b) document past institutional or organizational structure;
(c) illuminate development or change of a construct of interest (e.g., management paradigm, institution, agency); (d) illuminate foundational roots or precedent of a social construct (e.g., legislation); (e) reveal unintended consequences of decisions or programs; (f) reveal influence of individuals or programs on variable of interest; (g) reveal points of disagreement among social group and resolution.

- Textual records
- Environmental data
- Maps
- Audial media, e.g., cassette tapes
- Visual media: films, photographic prints and negatives

Charnley et al. 2017
<table>

<th>Specific application to decision-making context</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biography</td>
<td>How can we integrate individuals’ lived experiences to create a history of political decision-making and its outcomes in this location?</td>
<td>How might the history of this area influence resource users’ willingness to participate in conservation decision-making processes?</td>
<td>How can we design conservation programmes that meet the needs of resources users and are sensitive to context?</td>
</tr>
<tr>
<td>Phenomenology</td>
<td>How do Pacific Islanders experience rising sea level?</td>
<td>How does the experience of rising sea levels influence individuals’ and communities’ perceptions of the importance of different conservation decisions and initiatives?</td>
<td>How does experiential and contextual knowledge influence prioritisation of local-, regional-, and global-scale conservation actions?</td>
</tr>
<tr>
<td>Case study</td>
<td>How are the livelihoods of farmers affected by changes to tree clearing legislation?</td>
<td>What structures and policy instruments are needed to support legislative change for vegetation management?</td>
<td>When, and how, should landholders be compensated for changes to their property rights?</td>
</tr>
<tr>
<td>Grounded theory</td>
<td>What is the theory of conservation intention and commitment?</td>
<td>Who are the types of people that have an intention to conserve and why?</td>
<td>What combination of policy instruments could stimulate conservation behaviour in a given social-political context?</td>
</tr>
<tr>
<td>Ethnography</td>
<td>What role do stories play in shaping decisions about “Country” among Indigenous Australians?</td>
<td>How compatible are rationales for traditional and Western “resource” practices?</td>
<td>Can decision-making processes engage with different ways of seeing and managing “resources” and if so, how?</td>
</tr>
</tbody>
</table>
Some of the methods described above may collect traditional knowledge and local knowledge; these would be western science approaches to data collection and analysis.

Indigenous knowledge systems are valid and time-tested knowledge systems and need not be validated with western science methods.

Indigenous Knowledge: acquired and sustained through unique worldviews and “associated core values, beliefs, and practices that have survived and are beginning to be recognized as being just as valid for today’s generations as they were for generations past. The depth of Indigenous knowledge rooted in the long inhabitation of a particular place offers lessons that can benefit everyone, from educator to scientist, as we search for a more satisfying and sustainable way to live on this planet” (Barnhardt and Kawagley, 2005: 9).

The best available information about environmental systems is often indigenous knowledge; e.g. in the case of Alaska fishery systems this knowledge is living practice 12,000+ years deep.
REFERENCES

Round Island Walrus Hunt
Restoring subsistence hunting in a wildlife sanctuary

- Long tradition of land-based subsistence hunting on Qayassiq
- 1962: sanctuary created, hunting prohibited
- Efforts to restore access
- Documentation of traditional management: cakarpeknaki
- Key respondent, round table discussion; supplemented with historical sources
- 1995: successful, sustainable co-managed hunt
- Technical Paper 212; Fall and Chythlook, Cultural Survival Quarterly (1998)
Yellow-billed Loon
Ethnotaxonomy informing management

- Possible listing under ESA in part due to reported subsistence harvest levels
- Ethnographic interviews
- Revision (correction) of harvest estimates
- No ESA listing
Alaska Board of Fisheries C&T Findings

Identifying subsistence use patterns

- Subsistence priority and statutory definition: “customary and traditional”
- Formal process: the “eight criteria”
- Qualitative topics: history, harvest and processing methods, efficiency, social organization, values
- Mixed methods: key respondents, participant observation, case studies
- Findings rely on a mix of quantitative and qualitative information
- Helped inform NPFMC’s development of subsistence halibut regulations
Qualitative Data
Opportunities: Better
Context Characterization

Fleet Characterization

- Linkage of vessels to communities
- Annual round and vessel diversity
- Vessel crew opportunities and characteristics
- Links to subsistence networks

Processor Characterization

- Nature of relationship to larger community
- Annual round and processor diversity
- Processing crew opportunities and characteristics
Qualitative Data
Opportunities: Better Context Characterization

Support Service Sector

- Nature and magnitude of local sector
- Sectors supported, including offshore
- Employee/owner characteristics and opportunities

Public Revenues

- Local and shared state tax revenues
- Fees (e.g., moorage, gear storage)
- Infrastructure, utilities, and services demand
Qualitative Data Challenges

Nature of the fishing communities

- Number relevant to a given management action
- Size/Scale variation
- Regional considerations

Time and resources available for analyses

- Long-term, broad data collection needs
- Short-term, focused analytic needs
Qualitative Data Challenges

Analytic challenges

- Causal linkages to specific actions
- Larger trends and externalities
- Quality of potential community level social indicator data
- Effective use of social dimensions data as indicator of ecosystem status
