MEMORANDUM

TO: Council, SSC and AP Members
FROM: Chris Oliver
        Executive Director
DATE: November 29, 2005
SUBJECT: Ecosystem Approaches

ACTION REQUIRED

Report from interagency meeting and discussion of AI FEP

BACKGROUND

Report from Federal-State-Council meeting on an Aleutian Islands Ecosystem Forum

In accordance with the Council’s direction, the Council chair and staff continue to explore the creation of an Aleutian Islands Ecosystem Forum (AIEF) with interested Federal and State agencies. A meeting bringing together these various agencies for discussion of the AIEF proposal was held on November 16, 2005. The meeting agenda and proposal are attached as Item D-2(1). A draft summary of the meeting is attached as Item D-2(2).

The idea for the AIEF evolved from national and agency initiatives for improving management of ocean ecosystems. Through its Ecosystem Committee, the Council has been exploring various ways for the Council to respond to the directives of the President's Ocean Action Plan and the goals of NOAA’s strategic plan, and in June 2005, the Council chose to move forward with exploring a regional ecosystem collaboration for the Aleutian Islands.

The Council chair and staff met with NOAA Fisheries and the State of Alaska’s Subcabinet on Ocean Policy in June and August, and generally agreed to the Council’s preliminary preferred collaborative structure. This preferred structure would bring together Federal, State, and local agencies with jurisdiction over activities affecting the Aleutian Islands ecosystem area in a forum intended to enhance coordination and collaboration among the various participants. The forum would not have any management authority or jurisdiction.

As a next step to developing the concept, the three entities hosted a Federal-State-Council meeting to determine whether other Federal agencies would be interested in participating. Given the voluntary nature of this initiative, willing participation and allocation of resources is necessary for the endeavor to have utility and merit.

On the whole, agency representatives at the meeting found appeal in an opportunity to increase agency information-sharing and coordination. Much of the discussion focused on the importance of clarifying expectations among participants and the public regarding the function and purpose of an AIEF, and ensuring that an Ecosystem Forum would not duplicate existing collaborations. A Steering Committee of six members,
including the Council Chair, Ms. Madsen, and the current NOAA representative, Ms. Salveson (or Mr. Kurland as designee for the Steering Committee), has been created to further develop these and other issues. Their findings will be reported back to the group at a subsequent Federal-State-Council meeting, which is scheduled to take place in late February or March.

Aleutian Islands Fishery Ecosystem Plan (AI FEP)

The Council is considering ecosystem-based area-specific management in the form of an Aleutian Islands Fishery Ecosystem Plan for the AI fisheries. In June 2005, the Council adopted the following purpose and need statement for this action:

The Council recognizes that an explicit Ecosystem Approach to Fisheries (EAF) is a desirable process for management of the marine fishery resources in the Alaskan EEZ and therefore is a concept that it wishes to continue to pursue and further implement. A primary component of an EAF is the development of ecosystem-based fishery planning documents, and the Council intends to move forward with such development on a pilot basis. The Council recognizes that the Aleutian Islands ecosystem is a unique environment that supports diverse and abundant marine life, and a human presence that is closely tied to the environment and its resources. The Council believes that in light of these features, EAF could be a useful guide for future fishery management decisions in the Aleutian Islands area. Enhancing our current ecosystem approach to fisheries in the Aleutian Islands could allow the Council to better focus on the unique features of and interactions within the Aleutian Islands ecosystem area.

At its October meeting, the SSC recommended certain changes to the purpose statement in order to reflect the aggregate, cumulative emphasis of the FEP. The SSC’s minutes are attached as Item D-2(3).

A revised discussion paper, attached as Item D-2(4), provides a skeletal approach to a FEP for the Aleutian Islands. The Ecosystem Committee is scheduled to review the discussion paper at their meeting on December 6, 2005, as requested by the Council. Recommendations of the Committee will be available at the meeting.
State-Federal-Council Meeting on Ocean Ecosystem Issues
Birch/Willow Room, Hilton Hotel, Anchorage, AK
November 16, 2005 1-5pm

Draft Agenda

Welcome and Introductions

Overview
- How did we get here?
- An Ecosystem Approach to Management, the U.S. Commission on Ocean Policy report, and the President’s U.S. Ocean Action Plan
- What is the purpose of an Ecosystem Forum, and how might it be structured and operate?

Discussion
- Is there interest in greater federal-state-Council collaboration on marine ecosystem issues?
- Specific thoughts regarding the Aleutian Islands Ecosystem Forum proposal?
- Other issues or concerns?

Next Steps
- How do we move forward?
- Reaction to the sample issues for further collaboration? What are other issues that an Ecosystem Forum might address?
Proposal for an Aleutian Islands Ecosystem Forum

Background

The President's U.S. Ocean Action Plan calls for a more systematic collaboration and better integration of federal agency actions that affect ocean-related matters. The Bush Administration is working towards an ecosystem-based management approach to address regional ocean resource issues based on improved federal coordination and governance in collaboration with state and local officials. The North Pacific Fishery Management Council recognizes that its decisions regarding fisheries could be affected both positively and negatively by the actions of other entities, and vice versa. Accordingly, the North Pacific Fishery Management Council voted in June 2005 to explore the feasibility of an Aleutian Islands Ecosystem Forum (AIEF) or some similar mechanism for collaboration amongst the governmental bodies involved in Aleutian Islands ocean-related activities.

The North Pacific Fishery Management Council, the State of Alaska, and NOAA's National Marine Fisheries Service are discussing the idea of co-hosting a public workshop to develop the specifics of such an ecosystem-based management approach for coastal and ocean issues in the Aleutian Island region. The workshop will explore the purposes, role, responsibilities, and composition of an AIEF or similar forum for collaboration, as well as potential first topics that such a group might address. The meeting on November 16th would serve as a precursory discussion prior to a public workshop.

Purpose, Role, and Responsibilities of an Aleutian Islands Ecosystem Forum

The following text is a "strawman" description of the purpose, role, and responsibilities of an AIEF. The ideas reflected herein should be discussed, debated, and improved upon as appropriate during the meeting and workshop.

The AIEF would be comprised of one representative from the Council and one representative from each local, state, and federal governmental agency with jurisdiction over activities that directly affect the Aleutian Islands ecosystem. The AIEF would serve as a forum for coordination and collaboration, and would not have any independent jurisdiction or authority. The primary purpose of the AIEF would be to enhance coordination in support of the sustainable management and use of the Aleutian Islands ecosystem.

The role of the AIEF would be to provide an efficient forum for sharing information about human activities and natural processes affecting the Aleutian Islands ecosystem. The AIEF would promote open communication between government agencies, the Council, and Aleutian Islands residents and other stakeholders. The objective of this information sharing and open communication would be to encourage the entities with appropriate jurisdiction to make well-informed decisions that support sustainable natural resource management. For example, decisions about shipping lanes and marine transportation should account for potential effects on marine mammal populations, and decisions about fishery management should account for potential effects on seabird colonies. In the absence of effective coordination, an agency or Council with jurisdiction over a specific activity might make decisions that do not fully consider indirect consequences for other components of the ecosystem.

The AIEF would have no independent jurisdiction or authority, so it would not regulate any activity and no agency or Council would be required to obtain AIEF approval before acting. Each entity participating in the AIEF would be responsible for working in good faith to share pertinent information with other AIEF participants. The primary responsibilities of the AIEF would be to consider relevant information; facilitate open discussion of ways to resolve potential conflicts between competing uses of the Aleutian Islands ecosystem; and potentially develop consensus positions, if appropriate, to advise governmental bodies regarding the collective views of the entities participating in the AIEF. If the AIEF chooses to develop consensus positions and to advise
the federal government regarding those positions, the AIEF would likely first have to obtain a charter under the Federal Advisory Committees Act. In cases where the AIEF discusses an issue but reaches no consensus, the AIEF would take no position. No agency would be bound by any position taken by the AIEF -- such positions would merely represent advice for consideration by the entities with appropriate jurisdiction.

Issues that May be Addressed by the Ecosystem Forum

A sample of issues which agencies may wish to address in an ecosystem forum is provided below.

- **User conflicts**

The Aleutian Islands ecosystem supports a wide variety of human uses: fisheries, shipping, national defense, tourism, etc. Could an “Aleutian Islands Ecosystem Forum” identify existing or potential user conflicts and opportunities to minimize such conflicts?

- **Great Circle shipping route, oil spill risk/preparedness**

Trans-Pacific ships travel along the shortest route between Asia and North America, commonly referred to as the Great Circle Route. After the Selendang Ayu grounding on Unalaska Island, Governor Murkowski asked the U.S. Coast Guard to lead an effort to assess the risk posed by the international North Pacific shipping lanes to the Aleutian Islands in collaboration with the State. The assessment will need to determine future casualty and spill prevention measures to reduce the possibility of ecological damage in the Aleutian Islands. In addition to the U.S. Coast Guard and the Alaska Department of Environmental Conservation, there are a number of other federal and state agencies with responsibilities for managing ocean and coastal resources that can be affected by ship groundings. Could the Aleutian Islands Ecosystem Forum facilitate the open discussion and synthesis of agency positions on appropriate alternatives to assess and reduce the risk of shipping accidents in the Aleutians groundings?

- **ESA-listed species**

Critical habitat for Steller sea lions in the Aleutian Islands is primarily located in the State’s three mile territorial waters. These areas are closed to commercial fisheries, and re-opening to fishing may trigger an ESA Section 7 consultation and closure of other commercial fishing areas as a form of mitigation. Sea otters in the Aleutians were recently listed as threatened under ESA, but cause of decline is currently unknown. North Pacific right whale critical habitat is undergoing designation and may interact with shipping routes. Could an “Aleutian Islands Ecosystem Forum” provide an appropriate venue for discussion of these issues as they pertain to the larger ecosystem-based management?

- **Human and fishery health risk around Amchitka Island**

Amchitka Island was the site of three underground nuclear tests between 1965 and 1971. Radionuclides will leak from the island, but the timeframe for leakage is unknown. Radionuclides could contaminate a wide range of species, and could impact subsistence and commercial fisheries in the surrounding area. Consistent, long-term monitoring is needed to detect leakage. Could an “Aleutian Islands Ecosystem Forum” develop a plan to deal with the repercussions of eventual leakage?
• Living and non-living resource mapping, information collection, environmental quality monitoring, and research

A number of state and federal agencies are responsible for managing the use of the natural resources of the Aleutian Islands, and enforcing standards for the Aleutian Islands air, land and water quality. Accurate and reliable resource information is needed to support agency resource management and pollution control missions. Funds to collect and analyze resource information is limited and will never be sufficient acquire the data and apply the science needed to predict the outcomes of agency decisions with complete certainty. Resource data collection, monitoring, and research need to be targeted, cost-effective, and directed toward specific goals, objectives, and management priorities. Could an “Aleutian Islands Ecosystem Forum” help agencies identify, prioritize, and collaborate on environmental monitoring, scientific investigation, and applied research efforts?

• International resource management

The Aleutian Islands ecosystem borders international waters and the Russian Exclusive Economic Zone. Persistent Organic Pollutants (POPs) suspected to come from international sources have been found in fish and wildlife of the Aleutian Islands region. International transport of air contaminants (mercury and other POPs) with subsequent marine deposition of these contaminants needs to be quantified and better understood from an ecological system perspective. Could an “Aleutian Islands Ecosystem Forum” evaluate whether any activities outside of U.S. jurisdiction may adversely affect the Aleutian Islands ecosystem? And if so, could such a Forum bring pertinent issues to the attention of the U.S. Department of State for possible bilateral or multilateral discussions, as appropriate?

• Dutch Harbor wastewater

There are numerous issues with permitted wastewater dischargers in Dutch Harbor including the domestic wastewater facility and the multitude of seafood processors. There are several Clean Water Act Section 303(d) listed waters (polluted waters) near Dutch Harbor, with pollutants they include settleable solids, petroleum, oil and grease, and low dissolved oxygen. They are in various stages of waterbody recovery planning and recovery.
DRAFT
Federal-State-Council Meeting on an Aleutian Islands Ecosystem Forum:
Meeting Summary
November 16, 2005, 1-4 pm, Hilton Hotel, Anchorage, AK

The following people attended the meeting. Underlined participants represented the agency.

North Pacific Fishery Management Council
Stephanie Madsen, Chair
Chris Oliver, Executive Director
David Witherell, Deputy Director
Diana Evans, Fishery Analyst

NOAA Fisheries
Sue Salveson, Assistant Regional Administrator for Sustainable Fisheries
Jon Kurland, Assistant Regional Administrator for Habitat Conservation
Jon Pollard, NOAA General Counsel
Joe McCabe, NOAA General Counsel
John Olson, Habitat Conservation

Alaska Ocean Policy Cabinet
McKie Campbell, Chair; also Commissioner, Alaska Department of Fish and Game
Heather Brandon, Ocean Policy Coordinator

Department of Fish and Game
Earl Krygier, Extended Jurisdiction Coordinator
Ed Dersham, Project Coordinator, Commercial Fisheries Division

Department of Environmental Conservation
Kurt Fredriksson, Commissioner
Larry Dietrick, Director, Spill Prevention and Response
Leslie Pearson, Program Manager, Prevention and Emergency Response Program

Department of Natural Resources
Ed Fogels, Acting Deputy Commissioner

Department of Commerce, Communities, and Economic Development
Al Clough, Deputy Commissioner

17th Coast Guard District
Capt. Steve Hudson, Chief of Prevention

US Fish and Wildlife Service
Leonard Corin, Fisheries and Ecological Services Supervisor
Greg Siekaniec, Alaska Maritime National Wildlife Refuge Manager

Environmental Protection Agency
Marcia Combes, Director, Alaska Operations Office

Minerals Management Service
Kate Wedemeyer, Fisheries Oceanographer, Environmental Studies Section
Jeff Childs, Protected Species Biologist

Bureau of Land Management
Julia Dougan, Associate State Director

US Forest Service
Rob Spangler, Fisheries Biologist

National Park Service
Judy Gottlieb, Associate Regional Director for Subsistence and Partnerships

Alaskan Command
Jerome Montague, Alaskan Command Native Liaison

US Geological Survey
Tony DeGange, Chief, Biology/Geography Office, Alaska Science Center
The group met to discuss a proposal, initiated by the North Pacific Fishery Management Council (NPFMC), National Marine Fisheries Service (NOAA Fisheries), and the State of Alaska's Ocean Policy Cabinet (AOPC), to create an Aleutian Islands Ecosystem Forum (AIEF).

A presentation on the proposal was given by Ms Evans (NPFMC), Ms Brandon (AOPC), and Mr Kurland (NOAA Fisheries). The idea for the AIEF evolved from the President's Ocean Action Plan, and its directives for improving management of ocean ecosystems, as well as NOAA's ecosystem coordination initiatives. As presented to the group, the purpose of the forum would be to enhance coordination and collaboration among Federal, State, and local agencies with jurisdiction over activities affecting the Aleutian Islands ecosystem area, with a view to sustainable management and use of the ecosystem area.

The agency representatives discussed their initial reactions to the proposal. On the whole, the group valued the benefits of increasing information-sharing and coordination among agencies, and saw the ecosystem forum as potentially a way to achieve this. Some of the Federal agencies noted that their agencies are already beginning to consider how to address the policy directives of the Ocean Action Plan, and an ecosystem forum in Alaska could dovetail with those efforts. No one expressed interest in allowing an ecosystem forum to become a decision-making authority, and some representatives were cautionary about the need to be clear with the public in this regard in order to curtail expectations of such, and also the need to prevent the project morphing in such a direction.

In order to move forward with developing the AIEF proposal, the group decided to create a Steering Committee. The Steering Committee will develop specific suggestions regarding the purpose and function of the AIEF, its structure and operating procedures, using the general idea of the proposal, and the meeting's discussions as a guideline.

The members of the Steering Committee are Stephanie Madsen (NPFMC), Sue Salveson (NOAA Fisheries), Kurt Fredriksson (DEC), Lenny Corin (USFWS), Jerome Montague (Alaskan Command), and Tony DeGange (USGS). The items to be discussed by the Steering Committee include the following:

- **Overarching recommendations**
  - look at regional collaborations elsewhere in the nation, and see if there are applications to Alaska
  - look at the information-sharing forums that already exist in regulation, and see whether an AIEF would provide additional utility (e.g., NPFMC, regional response teams, etc.)
  - incorporate science early in the process

- **AIEF purpose and function**
  - develop an explicit statement of structure, purpose, and role of the AIEF, perhaps in the form of a charter or memoranda of understanding, to avoid public or agency confusion about the intended function of the forum
  - look at creating a comprehensive website which brings together information from all participant agencies on: bibliographies of scientific research; contact information within agencies by issue; information on present, past, future activities for help with NEPA cumulative impact studies; present and future research plans and opportunities for partnership
  - AIEF could also provide a forum for each agency to share its management and research priorities, which could lead to partnership opportunities; AIEF could also consider setting shared priorities (subject to Federal Advisory Committee Act restrictions)
  - AIEF could allow agencies to discuss problems to be solved or share lessons from solved problems with forum
- look at cooperative conservation opportunities
- include cultural resources in consideration of the ecosystem

- AIEF structure and operational procedures
  - consider setting up a flexible structure where agencies can participate or not in a particular meeting depending whether the agenda is of relevance
  - the President’s Ocean Action Plan emphasizes synthesizing and sharing existing data and information; how could AIEF accomplish this, and what are the necessary mechanics of such information-sharing
  - look at local and tribal government involvement
  - who will chair/co-chair meetings
  - will chair(s) decide the agenda, or will it be decided in advance at each meeting
  - will chair(s) be responsible for organizing meeting, arranging for presentations, venue, etc.
  - what level of commitment is required on the part of each agency (staff presentations at meetings, staff help with organization of meeting, share of venue costs)
  - how will meetings be funded (staff attendance, preparation; travel and venue costs)
  - how scientific advice will be incorporated
  - whether and how public comment will be incorporated

The Steering Committee will report back to the Federal-State-Council group with specific ideas regarding the issues listed above. The next Federal-State-Council meeting is intended for late February or March.
D-2 Ecosystem Approaches to Management

The SSC received a status report and update from Diana Evans (NPFMC) on the progress to date with Council development of an Ecosystem Approach to Management (EAM) and a proposal for an Aleutian Islands Fisheries Ecosystem Plan (FEP). Public testimony was given by John Warrenchuck (Oceana).

With regard to the development of an Ecosystem Forum, consisting of interagency representatives, the SSC recommended the development of a charter for such a group before any workshops be held so that the group's purpose would be well-defined and it would be clearer what kinds of issues it would consider.

With regard to the development of a Fishery Ecosystem Plan for the Aleutians, the SSC recommended emphasizing the new aspects of what might be covered in such a plan compared with what is being done, particularly under groundfish management in the status quo. The aggregate nature of fisheries impacts (across FMPs and state-managed fisheries) and external factors such as pollution, consideration of non-FMP species, etc. are important factors for such a plan and ecosystem team to consider. The constitution of the team being proposed seems to be broad enough that it could deal with a broad approach to ecosystem management (EAM) in addition to ecosystem approaches to fisheries management (EAF) and even deal with issues beyond the Aleutian Islands region that is part of this initial proposal. In addition, the Ecosystem Considerations section of the groundfish SAFE contains information that would be of use in this context and should be presented to the team.

Particularly, revisions of the discussion paper on Area-Specific Management for the Aleutian Islands should emphasize in the purpose and need section 4, the need to look at aggregate effects of all fisheries, external non-fishery factors, and coordinate actions across fisheries as reasons for going forward with this concept. Issues that an Aleutian Island FEP should consider (Section 6.3.2) should also emphasize these aggregate, cumulative impacts on the Aleutian Islands ecosystem.

The SSC noted that new initiatives at the national and international level are being initiated to assist in defining ecoregions. NOAA will be holding a workshop in the near future to get experts together to outline factors that should be considered in defining ecosystem and subecosystem boundaries. PICES will be holding a topic session at its next annual science meeting (October 2006 in Yokohama) that similarly deals with how such regions are being delineated by the international community. Outcomes from these activities should be considered by Council groups involved in Aleutian Islands ecosystem planning.

The SSC recommended that the Council consider reviewing at some point in the future after this activity has been implemented, what has been gained from this exercise that was new relative to what was already being done by the Council with regard to an ecosystem-approach to fisheries management.

Overall, the SSC was very positive towards this approach and looks forward to more progress in implementation by the Council. Once implemented, the Gulf of Alaska might be considered as the next most interesting region to be considered in a FEP.
Discussion items for developing an AI Fishery Ecosystem Plan

1. Purpose and Need Statement

The SSC has recommended revising the purpose and need statement to explicitly emphasize that the FEP should consider aggregate, cumulative impacts on the Aleutian Islands ecosystem. One of the ways that a FEP might provide added value to the Council, in addition to the many ecosystem-based analyses that are already produced for each Council action, is to focus on the Aleutian Islands and look cumulatively at impacts from all fisheries and non-fishing impacts. The cumulative impact analysis in other documents, such as the Groundfish PSEIS, does look at cumulative fishing and external effects, but from the perspective of the groundfish fisheries rather than the Aleutian Islands ecosystem. A FEP for the AI would provide an opportunity for fishery management to coordinate actions across fisheries.

A revision to the purpose statement to reflect such a change might take the form of the bolded text below:

The Council recognizes that an explicit Ecosystem Approach to Fisheries (EAF) is a desirable process for future management of the marine fishery resources in the Alaskan EEZ and therefore is a concept that it wishes to pursue and further implement. A primary component of an EAF is the development of ecosystem-based fishery planning documents, and the Council intends to move forward with such development on a pilot basis. The Council recognizes that the Aleutian Islands ecosystem is a unique environment that supports diverse and abundant marine life, and a human presence that is closely tied to the environment and its resources. The Council believes that in light of these features, EAF could be a useful guide for future fishery management decisions in the Aleutian Islands area. Area-specific management associated with an EAF should specifically examine the aggregate effects of all fisheries within the Aleutian Islands ecosystem area, cumulatively with non-fishery factors. Enhancing our current ecosystem approach to fisheries in the Aleutian Islands could allow the Council to better focus on the unique features of and interactions within the Aleutian Islands ecosystem area.

- Does the Council agree with the SSC that a purpose of this action should be to evaluate aggregate, cumulative effects of fisheries and non-fishery impacts in the AI ecosystem?

2. FEP outline, and focus on cumulative and aggregate effects

The basic structure of the FEP as laid out in the attached outline is as follows:

1. Purpose and need
2. Understanding the ecosystem area – what do we know about oceanographic and climate features of the AI ecosystem area, about species present in the ecosystem and their interactions, and about human activities influencing the ecosystem
   - summary/inventory of other sources, rather than encyclopedic
3. Ecosystem assessment – based on that understanding, can we assess the state of the ecosystem (defining and using appropriate ecological indicators)
   - along lines of AFSC work in PSEIS and SAFE chapter, but focused on AI
4. Implications for fishery management – using our knowledge of the ecosystem area to affect how we manage fisheries, both current (what we do now) and future (what we would like to move towards)
   - see further comments in #3, below
5. Priorities – based on the above, what are priorities for future research or management
The SSC’s recommended changes to the purpose statement, to focus on cumulative and aggregate effects of all fishing and non-fishing activities within the AI, would be reflected throughout the document.

- Does the outline proposed in the attached document seem appropriate? Does it provide an adequate focus on cumulative and aggregate effects?

3. Goals or future management approach to guide FMPs

The Council should consider what its intent for the FEP might be. Certainly, the document will be useful for inventorying information relating specifically to the AI ecosystem, and providing a cumulative perspective on interactions among species and human activities in the area. However, the Council may also wish the FEP to serve a more dynamic role by providing guidance on future fishery management actions and allowing the Council to coordinate actions across fisheries. To do this, the Council must establish within the FMP some goals or principles to be applied to fishery management actions affecting the AI ecosystem, and/or specific targets and priorities for increasing knowledge of ecosystem function, and approaches for management action.

One way to approach setting such goals, principles, or targets has been suggested in the outline FEP attached to this discussion list. Section 4 of the document is organized around eight general principles of ecosystem management which have been broadly summarized from the literature (Murkowski 2005). Each of these subsections could be laid out as follows. The first part of the subsection would describe current management practices that support this ecosystem principle, as relevant to each of the fisheries in the AI. The second part of the subsection could present goals or targets relating to the ecosystem-based management principle. For example, for the principle to evaluate tradeoffs among fisheries and reconcile conflicting goals, the first part would refer evaluate interactions among AI fisheries, and determine to what extent fishery management goals conflict. The second part would establish goals to apply to individual FMP management actions.

- Does the Council intend for the FEP to dynamically guide fishery management actions, or rather to be a compendium of ecosystem knowledge?
- If the former, would a series of ecosystem goals or targets organized around general ecosystem principles accomplish this intent?

4. AI Ecosystem Team

The Council included the option of creating an advisory AI Ecosystem Team in its direction to develop further the idea of area-specific management of the AI. Section 5 of the attached document looks at a couple of ways to develop this advisory team. However, one of the stated purposes for the team would be to help develop and certainly maintain the AI FEP. As such, if the Council chooses to go ahead with developing the FEP, it may be useful to create at the least a working group that might serve as a precursor to the AI Ecosystem Team, who could provide scientific advice and guidance on the FEP.

- Is there utility in creating an advisory group, perhaps a precursor to the AI Ecosystem Team, to guide the development of the FEP?
ROUGH OUTLINE FOR A
Fishery Ecosystem Plan for the Aleutian Islands

Appendix A Fishery Ecosystem Plans ................................................................. 35

The Aleutian Islands represent the central and eastern portion of the Aleutian-Komandorski (Commander) archipelago that extends from the Alaska Peninsula across the U.S.-Russian boundary to the Kamchatka Peninsula (see Figure 1). Numerous straits and passes through the Aleutian Islands connect the Bering Sea to the North Pacific Ocean. The islands are volcanic, with a narrow shelf descending to a steep dropoff. Rich in marine life, the Aleutian Islands are home to seabirds, marine mammals, sessile invertebrates, and fish stocks. The Aleut peoples have inhabited the islands for over 10,000 years and subsisted on the marine bounty.

In recent years, the Aleutian Islands have been at the forefront of many issues before the North Pacific Fishery Management Council (Council). The Aleutian Islands area has figured in focused measures to protect Steller sea lions and seabirds, conservation of benthic habitats that support coral and other special resources of public interest, and allocation issues related to the Aleutian Islands pollock and Pacific cod fisheries. With national interest on ecosystem-based management of fisheries heightened through recent Ocean Commission reports and other national-level panels, the Aleutian Islands area has been recognized by the Council as meriting consideration as a candidate for an ecosystem-based fishery plan.
1 Purpose and Need

The Council is faced with a growing national momentum to adopt an ecosystem approach to fisheries (EAF). Appendix A describes an ecosystem approach to fisheries, and the ways it may be incorporated into fishery management. While many of the Council’s management actions can arguably be considered to reflect an overall ecosystem approach, there is still progress to be made. There are many ways in which the Council could apply an ecosystem approach in its fishery management; however, much attention has been given to the concept of Fishery Ecosystem Plans (FEPs), or similar ecosystem-based fishery management documents. The Ecosystems Principles Advisory Panel touted FEPs as the way to move forward with ecosystem-based fishery management (EPAP 1999). Various draft legislative documents that have passed through Congress have suggested revisions to the Magnuson-Stevens Act that would require either FEPs or some other type of fishery ecosystem management document. To date, however, there are few examples of such documents, and there is no national template for their implementation, or their relationship to fishery management plans (FMPs).

The Council believes that applying a more explicit ecosystem approach to fisheries may be the appropriate way to move forward in fishery management. With regard to fishery ecosystem planning, the Council has the opportunity to help define the standard for implementing an EAF. As the practicalities of developing a fishery ecosystem planning document have yet to be worked out, the Council feels it is appropriate to designate an ecosystem area as a test case.

In recent years, the Aleutian Islands have been at the forefront of many issues before the Council. By its actions to date, the Council recognizes that the Aleutian Islands contain unique ecological values that the Council wishes to preserve. The Aleutian Islands area has figured in focused measures to protect Steller sea lions and seabirds, conservation of benthic habitats that support coral and other special resources of public interest, and allocation issues related to the Aleutian Islands pollock and Pacific cod fisheries. Recent scientific evidence indicates a clear ecological difference between the eastern Bering Sea shelf ecosystem and the western Aleutian Islands archipelago. Far less is understood about the ecological interactions in this area than in the eastern Bering Sea, yet the two areas are managed conjointly in all of...
the Federal fishery management plans. The Council may wish to consider fishery interactions within this ecosystem more directly, and applying an ecosystem approach to fisheries may promote this goal. For these reasons, the Aleutian Islands ecosystem area may merit consideration as a candidate for area-specific management, and could be an appropriate test case for the Council to develop a fishery ecosystem planning document.

The Council has developed the following purpose statement:

The Council recognizes that an explicit Ecosystem Approach to Fisheries (EAF) is a desirable process for future management of the marine fishery resources in the Alaskan EEZ and therefore is a concept that it wishes to pursue and further implement. A primary component of an EAF is the development of ecosystem-based fishery planning documents, and the Council intends to move forward with such development on a pilot basis. The Council recognizes that the Aleutian Islands ecosystem is a unique environment that supports diverse and abundant marine life, and a human presence that is closely tied to the environment and its resources. The Council believes that in light of these features, EAF could be a useful guide for future fishery management decisions in the Aleutian Islands area. Enhancing our current ecosystem approach to fisheries in the Aleutian Islands could allow the Council to better focus on the unique features of and interactions within the Aleutian Islands ecosystem area.

2 Understanding the Aleutian Islands Ecosystem Area

The Aleutian Islands region is a unique and, to many, a mystifying place. The Aleutian Islands form an archipelago that extends 1000 miles across the North Pacific and lies along the great circle routes used by vessels and aircraft transiting from the U.S. west coast to eastern Russia, Korea, and Japan. This island chain possesses special characteristics that set it apart from other areas in the North Pacific. It experiences some of the worst weather on the planet, it harbors abundant and diverse bird and mammal populations, and has an historic and cultural heritage that dates back to the last ice age when the region was likely colonized by peoples that crossed the Bering Land Bridge.

The Aleutian Islands themselves provide habitat for many species of nesting seabirds, rookery and haulout habitat for several species of marine mammals, and a migratory path for great whales, other marine mammals, and seabirds that occupy this region seasonally for feeding, nesting and fledging chicks. The region has a rich cultural heritage, and is poised to change as military, shipping, fishery, and community development proceeds in the coming decade.

2.1 Oceanography and Climate

Physical and Biological Characteristics

The Aleutian Islands area or “ecosystem” possesses unique abiotic and biotic environmental features and an interdependent web of energy flow from terrestrial and marine primary production through top level consumer organisms in an island-dominated geographic region. The island chain forms a boundary between the open North Pacific Ocean and its Bering Sea, although the boundary is highly permeable with many inter-island passes that are pathways for water exchange and movement of marine organisms (Figure 2). The Aleutian Islands mark the furthest southward extent of seasonal sea ice of the Bering Sea, although in recent years warming trends have minimized formation of ice in the more southerly portions of the Bering Sea.
From 4,000 ft mountain peaks to the 24,000 ft depths of the Aleutian Trench, the Aleutian Islands offer a unique and dramatic diversity in landforms. Many of the Aleutian Islands are crests of submerged volcanoes. The region is highly volcanic and seismically active because of the tectonic convergence of the Pacific Plate and the North American Plate; the Aleutian Trench marks the convergent boundary of these plates. The region spawns some of the intense weather systems that greatly affect the oceanography and biological productivity in the North Pacific Ocean. The region supports a wide diversity of organisms, some in large numbers, including millions of seabirds, thousands of marine mammals, and abundant fish species, some of which support commercial fisheries.

The climate of the Aleutians is maritime and characterized by frequent cyclonic storms and high winds, and during calm periods the region often is covered by dense fog. Marine water flows through the various passes between islands, providing nutrients to fuel the productivity of the region and the adjacent Bering Sea. The Bering Sea and Aleutian Islands region is one of the most productive marine systems in the world. Plankton and forage fish species provide a nutritional base for millions of seabirds and marine mammals as well as abundant pelagic and demersal fish species.
Figure 2  Map of the Aleutian Islands

Islands of Four Mountains to Unimak Island

Tanaga Island to Islands of Four Mountains

Attu Island to Tanaga
2.2 Species

The Alaska Fisheries Science Center’s Resource Ecology & Ecosystem Modeling group researches food web models for Alaska region waters. Models have been in development for the eastern Bering Sea and the Gulf of Alaska for some time, however the unique characteristics of the Aleutian Islands require an area-specific food web model. Using ECOPATH/ECOSIM, a model is currently being developed for the Aleutian Islands.

Fish

Marine Mammals and Seabirds

The Aleutian Islands are inhabited by diverse and abundant marine mammal and seabird populations. Many of these species feed on fish harvested in Federal or State fisheries, or otherwise interact with fishing activities, sometimes leading to injury or mortality. In the case of marine mammals, which are afforded special protection under the Marine Mammal Protection Act, any injury or mortality is illegal unless specially permitted. A similar situation exists for many of the seabirds in the area under the Migratory Bird Treaty Act. The Endangered Species Act also has considerable impact on activities in this region given the current listing status of many marine mammal and seabird species. The effects of these laws are magnified in the Aleutian Islands because of the abundance of species inhabiting this region, which are afforded these protections.

Steller sea lions

The Steller sea lion (*Eumetopias jubatus*) inhabits many of the shoreline areas of the Aleutian Islands, using these habitats as seasonal rookeries and year-round haulouts. Steller sea lions feed in the nearshore and offshore waters throughout the Aleutian Islands. The Steller sea lion was listed as threatened under the Endangered Species Act (ESA) on November 26, 1990 [55 FR 40204] and critical habitat for the species was designated August 27, 1993 [58 FR 45269]. In 1997 the SSL population was split into two stocks or Distinct Population Segments (DPS) based on genetic and demographic dissimilarities (Bickham et al 1996; Loughlin 1997)[62 FR 30772]. These are the western and eastern stocks. Because of a pattern of continued decline in the western DPS, the western DPS of SSL (wSSL) was listed as endangered on May 5, 1997 [62 FR 30772] while the eastern DPS remained under threatened status. The wSSL inhabits an area of Alaska approximately from Prince William Sound westward to the end of the Aleutian Island chain and into Russian waters (Figure 3).
Figure 3  Distribution of western and eastern distinct population segments of Steller sea lion

Throughout the 1990s, particularly after critical habitat was designated, various closures of feeding areas around rookeries and haulouts, and some offshore foraging areas, were designated to limit commercial harvest of pollock, Pacific cod, and Atka mackerel, which are important components of the wSSL diet. In 2001 a Biological Opinion was released that provided protection measures that would not jeopardize the continued existence of the wSSL nor adversely modify its critical habitat; that opinion was supplemented in 2003, and after court challenge, these protection measures remain in effect today (see Supplemental Figure A).

Over the past decade or more, the western Aleutian Islands wSSL sub-population was of particular concern. Non-pup counts declined from 14,011 in 1979 to just 817 animals in 2002. Although all other sub-populations in the western DPS increased between surveys conducted in 2000 and 2002, the western Aleutian Islands area group decreased by 23.7% in just two years. The cause of the steep decline observed in the area is unknown, although some researchers are finding links between prey composition and area. Other hypotheses involve changes in oceanic conditions such as salinity and temperature. Other possibilities for this sub-population include the taking of animals in Russian fisheries (e.g., herring). In 2004, scientists conducted another wSSL survey, and found that this Aleutian Islands sub-group is no longer declining. The overall wSSL population increased for a second consecutive survey (an increase was observed between the 2000 and the 2002 surveys.)

Because of the past declines observed in the wSSL population, special studies have been initiated in the Aleutian Islands area to determine the efficacy of the protection measures in providing areas closed to fishing where wSSLs can forage and obtain sufficient prey to meet nutritional requirements. These studies have been termed Fishery Interaction Studies, and have focused on fish movement patterns and the effect of commercial fisheries on Pacific cod and Atka mackerel in the Aleutian Islands. While results are very preliminary, no evidence of fishery-related localized depletion of these two species of fish have been detected, although the studies continue. These studies are unique in that they focus exclusively on fishery interactions with target species, with the objective of testing whether geographic closed areas are an appropriate tool for wSSL management.

While recent surveys show some possibility that the decline in abundance of the wSSL DPS may have halted, the entire DPS will be the subject of continued study and monitoring until persistent increases in
this population occur. Undoubtedly studies will continue to explore whether geographic closed areas or other wSSL protection measures may be part of this turn around. The Aleutian Islands wSSL population likely will be an integral part of this ongoing work.

Northern fur seal

The Northern fur seal (Callorhinus ursinus) seasonally occupies rookeries on the Pribilof Islands for mating and rearing of pups. This marine mammal uses Aleutian Island passes as important migratory pathways to and from the Pribilof Islands. The fur seal is pelagic for the winter months, although its habitat use patterns when not on the Pribilofs is largely unknown. The Northern fur seal has declined considerably in the past decade and is the subject of special study by NMFS and special attention by the Pribilof Islands Collaborative.

Harbor seals

Three separate stocks of harbor seals (Phoca vitulina richardi) are identified in Alaska, with the Gulf of Alaska stock inhabiting the Aleutian Islands (Angliss and Lodge 2003). Ongoing genetic stock identification studies suggest possibly more stock differentiation in the Alaskan harbor seal population, but sufficient data are not available to change the current three-stock structure. Harbor seals have declined in portions of their range in Alaska. The Aleutian Islands group has not been surveyed since 1994, so trends in the region are unknown. Given the declines in some areas, the use of harbor seals as a Native subsistence food item, and the unclear population structure in Alaska, harbor seals are the focus of ongoing research, most of it by the State of Alaska.

Sea otters

The southwest Alaska distinct population segment of the northern sea otter (Enhydra lutris) has been proposed for ESA listing as threatened because of a steep decline in abundance of sea otters, particularly in the Aleutian Islands area. If listed, the USFWS intends to develop criteria for designating critical habitat and to begin the species recovery process. Groundfish fisheries have not been implicated in the decline of sea otters, and interactions between this species and fisheries are not believed to be significant.

The Aleutian Islands area provides important habitat for this coastally-oriented marine mammal, where it remains year-round to feed and rear young. In the 1980s, the sea otter population in the Aleutian Islands ranged from 55,100 to 73,700 individuals (Calkins and Schneider 1985). A 1992 count in the Aleutian Islands area was 8,042 sea otters, and in the spring 2000 surveys the count for this area was 2,442 animals. On February 11, 2004, the USFWS published a Proposed Rule to list the southwest DPS as threatened [69 FR 6600]. The southwest DPS is designated as a strategic stock by the USFWS because of the possible ESA listing, and it is likely that special research and management attention will focus on this species in coming years, particularly in the Aleutian Islands.

Whales

Several species of whales use Aleutian Island passes as migratory pathways to feeding grounds in the Bering Sea and then to return to seasonal wintering and calving areas further south. Of these whales, the endangered North Pacific right whale is perhaps of most concern given its very small known population size. This whale moves through the Aleutian Island region annually to occupy feeding habitat in the eastern Bering Sea; it is very rare, and only up to 25 individuals have been seen annually in recent surveys.
Other whales move through the Aleutian Islands area, including blue whales, sei and minke whales, humpback whales, and gray whales. The blue whale is the subject of more focused acoustic studies designed to determine population size and habitat use patterns; blue whales may inhabit the Aleutian Islands area year-round. Sperm whales also inhabit the Aleutian Islands area, and are known to deplete longline-caught sablefish. Killer whales also have been known to deplete longline catches, and have been implicated as predators of Steller sea lions, sea otters, and other marine mammals in the Aleutian Islands. The extent to which whales utilize the waters around the Aleutian Islands is largely unknown, but the Aleutian Islands area appears to be important whale feeding and migratory habitat for many species.

Short-tailed albatross

The short-tailed albatross (Phoebastria albatrus) is listed as endangered [65 FR 46643] under the ESA because of its low population size compared to historic levels throughout its range. This albatross breeds primarily on a small island offshore the east coast of Japan. Telemetry studies indicate that after leaving their breeding and nesting grounds, short-tailed albatross move fairly quickly northward to the North Pacific and into the Bering Sea in spring and summer where these birds feed and may remain year-round. This seabird appears to concentrate particularly in the Aleutian Islands area, feeding on the continental shelf and slope and within passes between islands. Given the importance of the Aleutian Islands region as feeding grounds for this endangered seabird, continued research and management will likely emphasize at-sea capture and tracking movement studies in the Aleutian Islands (Rob Suryan, OSU, pers. comm., Oct. 2004) to better understand its year-round distribution and movement patterns. All longline and trawl groundfish fisheries managed by the Council are under an incidental take limit. Future groundfish fishery management in the Aleutian Islands area will likely give special attention to these concerns given the prominence of this species in the Aleutian Islands.

Steller's eiders

The Steller's eider (Polysticta stelleri) is listed as threatened under the ESA. This species of sea duck molts and then winters in nearshore marine waters throughout the Aleutian Islands where it mixes with the more numerous Russian Pacific population of Steller's eider (USFWS 2003). The species utilizes protected bays and inlets as refuge during a flightless period after molting, and then remains in many of these areas to feed throughout the winter. Causes for their decline are unknown but may include such factors as lead poisoning, predation on breeding grounds, contaminants, and ecosystem change. Concerns have been expressed over disturbance of this bird from vessel traffic or release of petroleum products into the marine environment in coastal areas where this species winters. There will continue to be elevated concerns over any human activity or development in or near Steller's eider habitat in the Aleutian Islands and Alaska Peninsula area.

Other seabirds

Millions of seabirds nest and fledge young from habitats on many of the Aleutian Islands. The Aleutian Islands area is considered one of the most important and significant seabird nesting areas in the North Pacific because of the unique habitats the islands provide. The Aleutian Islands marine waters over the continental shelf and slope and Aleutian Islands passes provide feeding grounds for millions of seabirds. The Aleutian Islands region seasonally supports thousands of cormorants, gulls, kittiwakes, guillemots, and murrelets and millions of storm-petrels, murres, auklets, and puffins. The Aleutian Islands also provide year-round habitat for large numbers of northern fulmar and smaller numbers of shearwaters and Laysan albatross and some black-footed albatross. One of the principal reasons the U.S. Congress established the Alaska Maritime National Wildlife Refuge, which encompasses nearly all land areas of the Aleutian Islands (and also other islands and coastal areas of Alaska; see Section 0 below), is because of the very high numbers of seabirds that nest and feed in this region.
**Benthic Habitat**

The continental shelf in this area extends only a small distance offshore, then breaks to an edge and slope descending to a seafloor that in some areas sustains unique assemblages of cold water corals, sponges, bryozoans, and other sessile invertebrates. Unlike the Bering Sea, the distribution of sediment type and texture is not known for the Aleutian Islands (NMFS 2004b), and these habitats have only recently been documented. The Aleutian Islands is thought to harbor the highest abundance and diversity of cold water corals in the world. Such benthic habitats and the fish and other organisms that associate with this habitat will likely be the focus of continued future research and observation, particularly using new submersible technology.

Under the Council’s Essential Fish Habitat program, much of the Aleutian Islands area and several Habitat Areas of Particular Concern (HAPCs) have received special protection from fishing activities (Figure 4). In February 2005, the Council approved closing large areas in the Aleutian Islands to bottom trawling to protect unique seafloor biological assemblages, especially beds of cold water corals, sponges, bryozoans, and other associated organisms. These closed areas include six Aleutian Islands coral gardens, which are closed to all bottom contact gear, and Bowers Ridge, which is closed to mobile bottom contact gear that includes pelagic trawls that contact the sea floor, non-pelagic trawls, dredges, and troll gear that contacts the sea floor (including dinglebar gear).

**Figure 4** Essential Fish Habitat mitigation areas and Habitat Areas of Particular Concern designated by the Council in February 2005
2.3 Human Activities

**Fisheries**

There are four federal fisheries that occur in the Aleutian Islands, for groundfish, halibut, scallops, and crab. The State of Alaska manages parallel and state-water fisheries for Pacific cod, salmon, herring, and black rockfish. Subsistence fisheries also occur for many marine species. Recreational fishing effort is small in the area.

**Federal Groundfish Fisheries**

Aleutian Islands groundfish fisheries are managed by the Council and the National Marine Fisheries Service (also referred to as NOAA Fisheries or NMFS) under the Bering Sea and Aleutian Islands (BSAI) Groundfish Fishery Management Plan (FMP). The Aleutian Islands is a subarea defined in the FMP as that area of the EEZ that is west of 170° W. longitude and south of 55° N. latitude, and it is divided into three districts (Figure 5).

Table 1 lists the species managed under the BSAI Groundfish FMP, and the catch in 2003 for those species in the Aleutian Islands and Bering Sea subareas. For comparison, catch is also indicated for these groundfish in the western GOA regulatory area (which encompasses waters west of 170° W. longitude, to the south of the eastern Aleutian Islands) and the remainder of the GOA regulatory areas. Catches in the Aleutian Islands subarea (AI subarea) have always been much smaller than those in the Bering Sea subarea. Total catches from the AI subarea in recent years have been just over 100,000 mt annually, compared to over 1.8 million mt in the Bering Sea subarea. The historical species composition for each subarea is illustrated in . Management of these Federal fisheries is complex given the geographic size and extent of the region, its distance from research and management facilities, and enforcement and safety concerns.

**Table 1** Catch, in mt, of groundfish FMP-managed species in Alaska, in 2003.

1. Includes starry flounder, rex sole, longhead dab, butter sole, and all species of flatfish caught in the management area, other than flathead sole, Greenland turbot, rock sole, yellowfin sole, arrowtooth flounder, and Alaska plaice.
2. Includes light dusky rockfish, shortspine thornyheads, and all species of Sebastes and Sebastolobus caught in the management area, other than Pacific ocean perch, northern rockfish, rougheye rockfish, and shortraker rockfish.
3. Includes soupskins, skates, sharks, and octopus.
4. Atka mackerel for the combined Eastern Aleutian Islands district and Bering Sea subarea was 11,010 mt in 2003; it is reported under the Aleutian Islands.
5. The Atka mackerel TAC is for the whole GOA, but is mostly caught in the western GOA.
6. Flatfish categories differ in the GOA; for flatfish catch breakdown, see Tumlock et al. 2003, data is for 2003 through October.

</table>

Historically, groundfish fisheries prosecuted in the AI subarea have included Atka mackerel, Pacific cod, sablefish, flatfish, and rockfish. Prior to 1999, pollock were harvested in this area. Pollock in the Aleutian Islands region is considered to be a separate stock from the eastern Bering Sea pollock, with a tentative boundary identified at 174° W. longitude, although there is some exchange between the stocks. From 1999 through 2004, the directed fishery was closed. Some pollock are harvested incidentally in other target fisheries (e.g., Atka mackerel, Pacific Ocean perch); in 2003, pollock bycatch in other directed fisheries was 1,653 mt.

Beginning in 2005, the Council has authorized allocation of pollock quota in a directed pollock fishery in the Aleutian Islands (Amendment 82). The allocation is to the Aleut Corporation per recent Congressional action (PL 108-199). The annual quota for this fishery currently is set at no more than 19,000 mt, less the CDQ apportionment and incidental catch allowances for other directed groundfish fisheries. The Council intends to re-visit this quota level and other aspects of the fishery in June 2006. Historically, harvests in
the AI subarea pollock fishery have occurred in several areas of concentration, including areas north of Atka Island, northwest of Adak Island, and east of Attu Island and north of Shemya Island.

The Pacific cod fishery is managed under a quota apportioned to the entire BSAI management area, and there is no evidence of stock structure within the management area. Pacific cod catch statistics for the AI subarea for the period 2000-2003 showed harvests ranging from 28,649 to 39,684 mt (average 33,335 mt; Thompson and Dorn 2003). This fishery has historically occurred around Adak and Atka islands. Since 1999, when the AI subarea was closed to a directed pollock fishery, the Pacific cod fishery has been prosecuted under Steller sea lion (SSL) protection measures that allow Pacific cod fishing to occur closer to shore than a directed pollock fishery would be allowed. During 1997-2001, the AI subarea accounted for an average of about 16% of the BSAI Pacific cod quota.

The Atka mackerel fishery harvested 54,287 mt in 2003. The center of abundance of Atka mackerel appears to be the Aleutian Islands, although their distribution ranges from the Kamchatka peninsula to the Gulf of Alaska. The harvest quota has been distributed across the AI subarea districts since 1992, to minimize the risk of localized depletion. Although the fishery takes place primarily in the AI subarea, the fishery also occurs north of Akutan Island in the Bering Sea subarea. Areas of harvest concentration in the AI subarea in 2003 were south of Amukta and Tanaga passes, east of Attu Island, and scattered in the Rat Islands area (Lowe et al. 2003).

The sablefish fishery in 2003 harvested 1,008 mt, almost all of which from longline and pot fisheries. The population is considered to be a single stock throughout Alaska and northern British Columbia. The directed fishery is entirely under an IFQ management system and is prosecuted with fixed gear; a small amount is taken incidentally in some trawl fisheries (35 mt in 2003). The locations of the sablefish harvests from 1995-2003 suggest most of the fishing effort in the AI subarea occurs within 100 nm of Adak and Atka. This fishery is not under special restrictions for SSL protection, and occurs in waters within 20 nm of shore in the AI subarea.

The AI subarea rockfish fisheries include catch of Pacific ocean perch (POP), northern rockfish, shortraker and rougheyse rockfish, and other rockfish. Rockfish harvested in the AI subarea in 2003 totaled 17,973 mt. Only the fishery for POP is directed, due to small harvest quotas; the other species are caught incidentally, primarily in the Atka mackerel and POP fisheries. 90% of northern rockfish are caught incidentally in the Atka mackerel fishery (Spencer and Ianelli 2003b). The Pacific ocean perch stock is spatially distributed in the AI subarea, where approximately 84% of the population is concentrated, according to survey data (Spencer and Ianelli 2003a). The fishery historically has occurred throughout the AI subarea with some concentration of harvests between Kiska and Agattu islands, around Amchitka Island and Petrel Bank, north of Atka Island, and in Amukta Pass. Shortraker and rougheyse rockfish are caught incidentally in a variety of target fisheries. The majority of 'other rockfish' catch is light dusky rockfish and shortspine thornyheads. In the AI subarea, these species are mainly caught incidentally in the Atka mackerel trawl fishery, for light dusky rockfish, and in sablefish, grenadier or skate longline hauls or the POP trawl fishery, for shortspine thornyheads. 'Other rockfish' are also distributed in the Bering Sea subarea, north of Unalaska and Akutan Islands and on the slope (Reuter and Spencer 2003).

Most flatfish species are concentrated on the continental shelf of the Bering Sea, and have low abundance in the AI subarea. The only target flatfish fishery in the AI subarea is for Greenland turbot. About 25% of the Greenland turbot biomass is located in the area, and in 2003, the harvest total was 960 mt, mainly by hook and line gear. The fishery has historically occurred primarily within 100 nm of Adak and Atka islands.
Squid and other species (sculpins, skates, sharks, and octopi) are caught incidentally in other directed fisheries. Squid are caught primarily in the pollock trawl fishery. Skates represent the majority of the other species catch (over 21,000 mt for the BSAI in 2002), and are caught in the hook-and-line Pacific cod fishery (Gaichas et al. 2004).

CDQ fisheries occur in the AI subarea for sablefish, Atka mackerel, Greenland turbot, Pacific ocean perch, northern rockfish, shortraker and rougheye rockfish, and other rockfish. In 2005, there will also be a CDQ AI subarea pollock fishery. CDQ groups partner with commercial fishing corporations to harvest these allocations. Most of the CDQ groups have ownership interest in the partner corporations.

The Aleutian Islands has been surveyed biennially by bottom trawl since 2000, and was mostly surveyed triennially from 1980 to 1997. The 2002 survey area extends from Unimak Pass (165° W. longitude) to Statemate Bank (170° E. longitude), including Petrel Bank and Petrel Spur, and covers the continental shelf and upper continental slope to 500 m. The aims of the survey are to provide distribution and relative abundance data for the principal groundfish and commercially or ecologically important invertebrate species in the Aleutian Islands, and to collect data to define biological parameters such as growth rates, length-weight relationships, feeding habits, and size, sex, and age compositions. The most abundant species in the area are Atka mackerel, POP, northern rockfish, walleye pollock, Pacific cod, arrowtooth flounder, and giant grenadier. However, fish populations, such as many rockfish, which extend into areas that are either untrawlable with the survey gear or further up in the water column are not fully represented.

The Aleutian Islands has also been surveyed biennially by longline since 1996. Surveyed depths vary from 200m to 1000m. Survey objectives are to determine the relative abundance and size composition of sablefish, shortspine thornyhead, rougheye and shortraker rockfish, Pacific cod, arrowtooth flounder, grenadiers, and Greenland turbot. Tags to determine migration patterns of sablefish, shortspine thornyhead, and Greenland turbot are also implanted, and data to determine age composition of sablefish.

Ongoing groundfish research projects in the Aleutian Islands address the reproductive ecology of Atka mackerel, and the value of habitat, particularly coral and sponge habitat, to juvenile rockfish in the area.

Other Federal Fisheries

The halibut stock is managed by the International Pacific Halibut Commission (IPHC). Two of the IPHC statistical areas for the halibut fishery encompass portions of the Aleutian Islands, Areas 4A and 4B (Figure 7). Over the last five years, approximately 8,028,000 lb annually, or 14% of the Alaska halibut quota, have been allocated to these areas. Halibut allocations in Alaska are managed under an individual fishing quota program and a community development quota program.

The Federal scallop fishery is managed by the State of Alaska with Federal oversight. The Aleutian Islands scallop fishery is managed under registration Area O (Dutch Harbor). Area O extends from Scotch Cap Light (164° 44' W. longitude) to the Maritime Boundary Agreement Line that separates U.S. and Russian waters, and encompasses both State and Federal waters. Scallop fishing in Area O generally occurs in the far east, to the north and south of Unnak Island (polygons marked on Figure 8). Area O was closed in 2000 due to management concerns over localized depletion. In 2002, the area was reopened with a reduced guideline harvest range ceiling of 10,000 lb, of which 61% was harvested. Area O represents approximately 1.5% of the statewide guideline harvest range for scallops.
The Federal king and tanner crab fishery is also managed by the State of Alaska with Federal oversight. In the Aleutian Islands, king crab fisheries are managed within registration Area O (Figure 9). The primary crab fishery that occurs in the region is the Aleutian Islands golden (brown) king crab fishery. Guideline harvest levels (GHLs), are established for the fishery east and west of 174° W. longitude. While effort and harvest have remained relatively stable in the eastern portion of the fishery, where the GHL for 2003-4 was 3.0 million lb, the western portion has experienced greater variability. The GHL for west of 174° W. longitude was 2.7 million lb, and both GHLs remain unchanged for 2004-5. Seasons in the golden king crab fisheries last several months, in contrast to other Bering Sea crab fisheries.

There is also an Aleutian Islands red king crab fishery in Area O. The eastern portion of the red king crab fishery has been closed since 1983, and the western portion, which operates in the Petrel Bank area, has opened sporadically in recent years. The fishery did not open in 2004.

Small tanner crab fisheries in the Aleutian Islands are managed in registration Area J (Figure 10). Tanner crab populations in this area are small, and, when open, are mainly authorized for incidental harvest only.
There are currently no CDQ crab fisheries in the Aleutian Islands. However, under crab rationalization, which will be implemented in 2005, CDQ groups will receive a 10% allocation of the western Aleutian Islands golden and red king crab fisheries.

**Figure 10  Tanner crab Registration Area J, with Eastern and Western Aleutian Districts**

**State Managed or Parallel Fisheries**

Future groundfish fishery management in the Aleutian Islands could include expanded parallel fisheries in State waters. Parallel fisheries are managed by the State of Alaska and may occur concurrently with the Federal groundfish fisheries, mirroring the Federal closures and harvest restrictions. Currently, the only directed parallel fishery in the Aleutian Islands occurs for Pacific cod, although other species are taken incidentally.

As outlined in the EA/RIR for Amendment 82 to the BSAI FMP, the potential exists for the State of Alaska to pursue a State-managed or State water pollock fishery in the Aleutian Islands, in which the State regulates the fishery and controls the closures and harvest restrictions. Were the State to initiate such a fishery without adopting the same restrictions as the Federal Steller sea lion protection measures, reinitiation of Section 7 consultation on the Steller sea lion protection measures likely would be required to determine the cumulative effects of the State-managed pollock fishery.

Other State-managed fisheries include sablefish (within State waters), salmon (primarily pink salmon and some sockeye salmon), herring for sac roe or food and bait, and black rockfish. These fisheries are prosecuted wholly within State waters. With increases in human populations in the Aleutian Islands that may accompany military, port, and community development, there may be additional participation in these fisheries and perhaps other, new State fisheries may evolve.

**Subsistence and Personal Use Fisheries**

The earliest fisheries in the Aleutian Islands were native subsistence fisheries. Today, subsistence fishing takes place in nearshore waters utilizing such species as cod, halibut, rockfish, and other species. These small-scale subsistence fisheries have continued to the present time. Subsistence activities continue to be a central element in contemporary village life and culture, and are also important to many of Alaska’s non-Native residents. Total subsistence consumption ranges from about 200 lb per capita to over 450 lb.
per capita. Fish, including salmon, halibut, cod, and rockfish, contribute between 57 and 75% of total subsistence resource consumption in the Aleutian Islands. Other subsistence resources include marine and land mammals, seabirds, and marine invertebrates (NMFS 2004a).

**Marine Mammal and Fishery Management Issues**

Two situations exist in the Aleutian Islands area that may merit special consideration. One is the geographic extent of the SSL protection measure closures. Over 41% of the AI subarea shelf and slope, to 1000 m, is closed to trawl fishing seasonally or year-round (NMFS 2004a). And a second is the potential changes in how pollock stocks are managed, which may have effects on how the AI subarea pollock fishery evolves in future years.

**Steller Sea Lion Protection Measures**

Steller sea lion protection measures include areas closed to all or some groundfish fisheries around rookeries and many haulouts along the Alaskan coast (see Supplemental Figure). These measures were put in place as a result of the steep decline in the SSL population and the hypothesis that this decline could be from nutritional stress. Fishing for pollock, Pacific cod, and Atka mackerel is restricted in these areas to limit fishing on prey items that are important in SSL diets. Closures are widespread in the Aleutian Islands. Recent concerns over the broad extent of closures, and recent research that suggests other hypotheses for the Steller sea lion decline, have led to public proposals for relaxing these measures and opening some areas to allow fishing.

A large proportion of the historical pollock harvest in the Aleutian Islands has come from waters that are now closed to pollock fishing by SSL protection measures. Under the current SSL protection measures, vessels generally must fish at least 20 miles from shore. The inclement weather conditions prevailing during the winter, when the AI subarea pollock “A” season fishery will occur, will likely impede growth of a small vessel pollock fishery that is a goal of Amendment 82. Proposals to change SSL protection measures in the Aleutian Islands area have been brought to the Council and its Steller Sea Lion Mitigation Committee, but the Council has decided not to pursue such changes at this time until more SSL research information becomes available. Nonetheless, it is likely that this issue will remain a concern given the Council's approval of Amendment 82 and the initiation of a directed pollock fishery.

**Evolving Understanding of Pollock Stock Structure in the Aleutian Islands**

Aleutian Islands pollock stock assessments are evolving, and in the near future, stock assessment biologists may recommend subdividing the Aleutian Islands subarea for the purposes of pollock management. Barbeaux et al. (2003) have examined the Aleutian Islands pollock stock and have suggested alternative approaches to assessing pollock resources in the AI subarea that account for spatial patterns in stock distribution. The population of pollock west of 174° W. longitude appears different in size structure and abundance, and it may be recommended that it be separated from the pollock stock east of 174° W. longitude. Barbeaux et al. (2003) recommend closing the area east of 174° W. to a directed pollock fishery, to form a contiguous closed area with the Bogoslof District (see Figure 5). This pollock conservation zone would provide a buffer between management areas and address uncertainties regarding stock structure. This proposal was discussed by the BSAI Groundfish Plan Team in 2003 and 2004.

Recent pollock stock assessment analyses have suggested that spatial considerations be reflected in recommending ABC levels. This may result in TAC recommendations for areas smaller than the AI subarea, which, in order to have catch proportional to biomass distribution, could impact the amount of pollock available to harvest in the central Aleutian Islands. There are currently three districts identified.
within the AI subarea in the BSAI Groundfish FMP (see Figure 5), and the 174° W. longitude line bisects the Eastern Aleutian Islands District. A recommendation for spatial apportionment of the AI pollock TAC is a reasonably foreseeable issue that the Council will need to weigh as decisions are made on future management of fisheries in the Aleutian Islands.

**Cultural Heritage and Human Development Issues**

The Aleutian Islands were likely settled by Aleut peoples that moved to Alaska across the Bering Land Bridge perhaps 15,000 years ago. Aleuts subsisted on what the Aleutian Islands and surrounding marine environment provided. With the arrival of Russian explorers and fur traders starting in 1742, the Aleutian Islands became a focus for fur harvests until 1867 when Russia sold Alaska to the United States. U.S. territorial management continued the fur trade and imposed many changes in the region. In the early 1940s, several islands became World War II battlegrounds and staging areas for the U.S. Aleutian Campaign, dramatically changing the landscape on many islands.

Thus the Aleutian Islands have a rich cultural heritage based on the early inhabitant Aleut peoples and subsequent waves of human occupation including the Russian fur trade, management of Alaska as a territory of the U.S., World War II and Japanese occupation, and in past decades a variety of human endeavors including defense installations, atomic energy research and testing, and commercial fisheries. These various human activities have left their mark on the Aleutians in a unique way, providing an historic and archeological heritage found nowhere else in North America.

**Development at Adak**

Adak Island was the site of a military naval air station until 1997. The site of an early Aleut community, the Aleut Corporation obtained a portion of the island and incorporated the City of Adak in 2001. With passage of PL 108-199 and the Council’s recent action to provide for an Aleutian Islands directed pollock fishery, Adak community development will likely increase in the coming years. The Council’s action, which allocates AI subarea pollock to the Aleut Corporation, will contribute to the growth of the port and community of Adak. Some connected with the Aleut Corporation have suggested that they would like to see Adak grow from a community of under 200 persons to a community of about 1,000 persons. The City of Adak and the Aleut Corporation are pursuing a wide range of development projects, seeking to take advantage of the facilities (harbor, airport, fuel storage, buildings) left behind by the Navy when the base was closed. Other regional development may result as Adak grows and services in the community expand.

**Other Regional Development**

In addition to expansion of Adak and growth of a commercial fishery based there, the Aleutian Islands are slated for additional development. Military development in the Aleutian Islands may expand, possibly including missile defense systems in the region; development on Shemya Island, or possible activities on Amchitka Island to mitigate lingering effects of nuclear testing, also may occur. It would be speculative to determine any specific activity, since much of this is anecdotal or militarily classified. However, in April 2003, Adak was selected as the site for a $900 million radar system as part of the national missile defense system. This facility is expected to arrive in Adak by summer 2005. Port expansion is also being proposed in the Dutch Harbor/Unalaska area; the Little South America port facility is being studied and environmental and other studies are still progressing. A new port development at the head of Akutan Bay is the subject of a recent Corps of Engineers EIS; a decision on that development may be made soon. Continuing or new military activity, and these port developments, collectively would add vessel and aircraft traffic in the Aleutian Islands area.
Research, Scientific Issues, and Public Interest

Alaska Maritime National Wildlife Refuge

Most of the islands in the Aleutian chain are part of the Alaska Maritime National Wildlife Refuge, which is administered by the US Fish & Wildlife Service (Figure 11). The Refuge was established to protect breeding habitat for seabirds, marine mammals, and other wildlife. Some islands hold unique species not found elsewhere. The Refuge hosts seabird populations of national and international significance, providing nesting habitat for an estimated 40 million seabirds representing over half of all the nesting seabirds of the U.S. The Refuge also provides important habitat for Steller sea lions, harbor seals, and sea otters.

Figure 11  Map of the Alaska Maritime National Wildlife Reserve.

The Refuge also was established to make possible a program of scientific research on marine ecosystems. Scientists from the U.S. and other nations frequent the Aleutian Islands to conduct a variety of research projects. The region has high scientific visibility given its unique habitats and plants and animals. The research program and scientific activities within the refuge include the eradication of rats and foxes from the islands, and annual seabird and nesting surveys.

Public Interest and Ecotourism

Conservation organizations have been publicizing the unique environmental attributes of the Aleutian Islands for many years. Dozens of colorful publications, brochures, and website advertisements have highlighted the benthic habitats, coral and sponge assemblages, and fish habitat characteristics of the Aleutian Islands. Cruise ship traffic has increased and brings the public closer to this region than has been the case in the past. Public awareness of these unique aspects of the Aleutian archipelago has increased, and thus the region is now more visible and the focus of public education campaigns for additional conservation, habitat and species preservation movements.
3  Assessment of the Al Ecosystem

### Ecosystem Implications for Fishery Management

#### 4.1 Defining a Boundary

There are two issues relating to defining a boundary for the Aleutian Islands that are discussed here: the management implications of the Aleutian Islands boundary, and the Aleutian Islands as part of a Large Marine Ecosystem.

**Management Implications of the Aleutian Islands Boundary**

In considering area-specific management, an important element is to define a boundary for the Aleutian Islands management area. If the purpose is to consider a cohesive Aleutian Islands ecosystem separate from dissimilar habitat and oceanographic processes of the Bering Sea, the need to appropriately define the extent of the Aleutian Islands ecosystem seems critical. Although it is difficult to define unequivocal lines for an ecosystem, for the purposes of management the Aleutian Islands must have a distinct spatial boundary.

Geographically, the Aleutian Islands archipelago ranges from Attu Island to Unimak Island, approximately from 170° E. to 165° W. longitude (Figure 2, on page 7). The boundary defined for the Aleutian Islands in each of the Federal FMPs, however, is different (see discussion in Section Error! Reference source not found., above). For groundfish, the BSAI FMP defines the Aleutian Islands subarea as that area of the EEZ that is west of 170° W. longitude and south of 55° N. latitude (Figure 5).
This definition means that the Fox Islands, which include Dutch Harbor and Akutan, are not included in the AI subarea.

The subareas and regulatory areas of the BSAI and GOA Groundfish FMPs are based on statistical areas defined by the International North Pacific Fishery Commission (INPFC) in the 1950s. The INPFC Shumagin area (now statistical area 610, see Figure 12) includes waters south of the eastern Aleutian Islands and the Alaska Peninsula, between 170° W. and 159° W. longitude. This area is included in the GOA Groundfish FMP management area.

The BSAI Groundfish FMP originally defined four subareas, all based on INPFC statistical areas (25Figure 13). Areas 1 and 4, now the southern portion of the Bering Sea subarea and the Aleutian Islands subarea, respectively, abut the Aleutian Islands. The four areas are still evident in the statistical areas used by NMFS to monitor groundfish catch in the management area (Figure 14).

None of the existing statistical area boundaries correspond exactly with a geographically-defined Aleutian Islands area. In the BSAI FMP, in addition to the Aleutian Islands subarea, statistical areas 517, 518, 519, and 509 all border the eastern Aleutian Islands to the north (Figure 14). In the GOA management area, the western half of statistical area 610 borders this area to the south (Figure 12).

In considering area-specific management for the Aleutian Islands, the question of an appropriate boundary for the area is a critical one. This is discussed in further detail under each of the management options below. However, it is worth noting some overarching considerations. First, any extension of the Aleutian Islands boundary beyond that of the AI subarea, for management purposes, will create a
disconnect between data describing the Aleutian Islands before and after the change. The disconnect would be seriously compounded should the Council draw a boundary that does not correspond to one of the existing statistical areas. Inseason data are collected at many spatial levels, including Federal statistical areas, State of Alaska statistical areas and precise GPS haul locations for some directed fisheries; however, drawing new Federal statistical areas would make historical comparison of data for this area difficult.

The difficulty with managing data should not necessarily prevent the Council from defining an appropriate Aleutian Islands boundary, although it is an important consideration. For some of the management options discussed in this paper, the defined boundary of the Aleutian Islands may be allowed to differ between the area-specific plan and the management measures in the FMP. While such a solution is not ideal, as it increases the probability of confusion, it may provide the Council necessary flexibility.

**Evidence of Aleutian Islands Ecosystem Boundaries**

A recent volume of Fisheries Oceanography is devoted to the marine ecology of the Aleutian Islands, and is based on a series of research cruises along the archipelago. Results from the research indicate that there is evidence of an ecological division at Samalga Pass, which is at 169° W. longitude (Hunt and Stabeno 2005; Figure 15).

**Figure 15 Eastern end of the Aleutian Archipelago, showing Semalga Pass**

East of the Pass, waters from the Alaska Coastal Current predominate, and west of there waters from the Alaska Stream are the prevalent source. Weather east of 170° W. longitude is closely associated with the Aleutian Low Pressure, and to the west weather is more influenced by Asian circulation. Marine ecosystems of the Aleutian Archipelago show a strong discontinuity at Samalga Pass. Deep-water corals, zooplankton, fish, marine mammals, and seabirds show a step change in species composition there. Diets of groundfish, sea lions, and seabirds change there also. Fish growth and tissue composition studies suggest productivity declines westward along the Archipelago. Based on these findings, the authors suggest that marine waters of the Aleutian Archipelago are divided into at least two different ecological regions, with a break at Samalga Pass (Hunt and Stabeno 2005).

The authors also note that there are abrupt changes in the composition of fish communities at several of the major passes, and that Samalga Pass may represent only one of several ecological divisions in the Aleutian waters (Hunt and Stabeno 2005).
The Aleutian Islands Region and Large Marine Ecosystems

NOAA has adopted the Large Marine Ecosystem, or LME, concept for approaching regional marine ecosystem management. The agency has identified ten LMEs across the nation, three of which are in Alaska. The three geographic areas in Alaska are the Arctic, the Bering Sea, and the Gulf of Alaska. The Council actively manages fisheries in the GOA and the Bering Sea. No known commercially exploitable fish populations inhabit the Beaufort and Chukchi Seas (comprising the Arctic LME).

The Aleutian Islands do not fit neatly into the proposed LME categorizations. The region lies on the border of the Bering Sea and the GOA LMEs. However, although NOAA’s discussions on the practical applicability of the LME concept to ecosystem management have not progressed into actual guidelines, it has been acknowledged that in some instances, subregions may be appropriate to deal with unique areas.

The Council’s management of the North Pacific groundfish and shellfish resources of commercial value is centered in three regions, the Gulf of Alaska, the eastern Bering Sea, and the Aleutian Islands. Species complexes, environmental forcing mechanisms, productivity, ocean floor relief, and overall productivity and target species biomass levels are quite different in each of these three areas. Thus current fishery management basically focuses on three ecosystems in the North Pacific, not two. In a practical fishery-management context, the Aleutian Islands region west of about 165° W. longitude extends into an open oceanic environment much of which is distant from the actively fished eastern Bering Sea. The Aleutian Islands have different environmental characteristics than the eastern Bering Sea and the GOA, different target species fisheries, and unique marine mammal and seabird issues that fishery management must consider.

For these reasons, considering the Aleutian Islands as an LME subregion is likely to be compatible with the LME concept.

4.2 Conserve and manage species
- target, non-target, protected, endangered, threatened, biodiversity

Cumulative Goals

4.4 Consider tradeoffs and reconcile conflicting goals
- among sectors, fisheries, cumulative effects, external impacts

Interactions among fisheries
BSAI Groundfish FMP and GOA Groundfish FMP

The BSAI and GOA groundfish fisheries are managed in close connection with one another. While many of the same groundfish species occur in both the BSAI and GOA management areas, they are generally considered to be separate stocks. There is some overlap between participants in the BSAI and GOA groundfish fisheries. Many of the management measures and much of the stock assessment science are similar for the two areas. Management measures proposed for the BSAI groundfish fisheries are analyzed for potential impacts on GOA fisheries. Where necessary, mitigation measures are adopted to protect one area or the other (for example, sideboard measures in the AFA pollock cooperatives).

Groundfish FMP and crab FMP

Domestic fishing for crab for the most part predates the domestic groundfish fishery, and since the inception of the BSAI Groundfish FMP the consideration of crab bycatch in the groundfish fisheries has been paramount. The crab species are considered prohibited in the BSAI groundfish fisheries, with any catch required to be returned immediately to the sea with a minimum of injury so as to discourage targeting on those species. Other management measures have also been instituted to minimize the bycatch of crab in the groundfish fisheries, including area closures, gear modifications, and catch limits. Some participants in the BSAI crab fishery also target groundfish. The crab FMP contains sideboard measures constraining AFA pollock fishery participants from increasing their participation in the crab fishery.

Groundfish FMP and scallop FMP

There is very little interaction between the scallop FMP and the BSAI groundfish FMP. Virtually none of the vessels in the scallop fishery target groundfish. The scallop FMP contains sideboard measures constraining AFA pollock fishery participants from participating in the scallop fishery.

Groundfish FMP and salmon FMP

Pacific salmon are also a prohibited species in the BSAI groundfish FMP. There is no fishing of salmon allowed in the EEZ, therefore there is no overlap of participants or grounds conflicts. The BSAI groundfish FMP includes management measures to reduce the bycatch of salmon in federal waters, including catch limits and area closures.

Groundfish FMP and halibut

The fishery for Pacific halibut in the BSAI is conducted under an Individual Fishing Quota (IFQ) program, in conjunction with the FMP-managed sablefish resource. A realized benefit of the IFQ program is the reduction in halibut bycatch mortality. Much of the longline bycatch of halibut occurred in sablefish fisheries. To the extent that sablefish fishers have halibut IFQ, this halibut is now retained and counted against target quotas.

As long as Council and IPHC objectives concerning halibut utilization remain similar, coordination between the two organizations is easily affected. Should halibut management philosophies diverge – for example, because the broader-based Council constituency objects to constraints on fishery development caused by overriding halibut-saving measures – a major social, political, and, perhaps, diplomatic (because of Canadian involvement in IPHC and in the halibut fishery) confrontation could be precipitated. Furthermore, management actions taken in the Bering Sea that adversely affect halibut are likely to have a significant impact on the Gulf of Alaska halibut stock and fishery because of the interchange of halibut between the two regions.

Groundfish FMP and state groundfish

A parallel groundfish fishery occurs where the State allows the federal species TAC (total allowable catch) to be harvested in State waters. Parallel fisheries occur for pollock, Pacific cod, and Atka mackerel species, for some or all gear types. In addition, the State also has state managed fisheries for Pacific cod
and rockfish species. Opening state waters allows the effective harvesting of fishery resources because many fish stocks straddle State and Federal jurisdiction and in some cases a significant portion of the overall federal TAC is harvested within State waters. Although the State cannot require vessels fishing inside state waters during the Federal fishery to hold a Federal permit, it can adopt regulations similar to those in place for the Federal fishery if those regulations are approved by the Board of Fisheries and meet State statute. An example of Federal fishery regulations that were concurrently adopted by the Board of Fisheries are the Steller sea lion protection measures implemented in 2001.

Groundfish FMP and other state fisheries:
State shellfish fishery: King and Tanner crab species are considered prohibited species in the BSAI groundfish fisheries, with any catch required to be returned immediately to the sea with a minimum of injury so as to discourage targeting on those species. Other management measures have also been instituted to minimize the bycatch of crab in the groundfish fisheries, including area closures, gear modifications, and catch limits.

State salmon fishery: Pacific salmonids are prohibited species in the BSAI groundfish FMP, and must be immediately returned to the sea with a minimum of injury. Some controversy exists regarding the degree to which salmon bycatch in the groundfish fisheries affects State salmon runs, particularly in times of declining returns. The Council has established and reduced salmon bycatch limits in the BSAI groundfish trawl fisheries in response to increased salmon bycatch concerns.

State herring fishery: Pacific herring are considered a prohibited species in the groundfish fishery, and must be immediately returned to the sea with a minimum of injury. Historically, bycatch of herring was high in the Bering Sea pollock fishery. But, in the early 1990s the Council adopted a catch limit of 1 percent of the herring biomass. Once reached, the cap triggers closure of a predetermined “herring savings area” for the remainder of the season. This measure has succeeded in limiting herring bycatch in the pollock fishery. Herring bycatch in other target groundfish fisheries is very low.

State water subsistence fishery: Subsistence fisheries in Alaska are managed by the State, and take place primarily in state waters. Groundfish fishery participants and fishing communities engage in subsistence activities, however groundfish are a minor target of subsistence fishing (see Section 4.3.3 for a description of the subsistence groundfish fishery). Where appropriate, subsistence groundfish harvests are accounted for in annual groundfish stock assessment.

Cumulative Goals

TBD

4.5 Account for feedback effects

- predator-prey interactions, gear on habitat

Gear on habitat

The Ecosystem Considerations chapter (Boldt 2005) provides information on the spatial pattern of fishing effort in the groundfish fisheries in the Aleutian Islands subarea. Figure 16 and Figure 17 demonstrate the spatial location and density of bottom trawl and hook and line effort in the AI between 1990 and 2004.
Figure 16  Spatial location and density of hook & line effort in the Aleutian Islands, 1990-2004

Figure 17  Spatial location and density of bottom trawl effort in the Aleutian Islands, 1990-2004

Cumulative Goals

TBD
4.6 Maintain ecosystem productivity

- capacity, resilience

Cumulative Goals

TBD

4.7 Balance ecosystem structure

- trophic balance

The Ecosystem Considerations chapter (Boldt 2005) looks at the trophic level of the catch to assess how well fishery management is meeting the goal of sustainability, for consumptive and non-consumptive uses. Figure 18 and Figure 19 indicate the catch composition of the total biomass in the Aleutian Islands from 1962 through 2003, and the trophic level of the catch, and concludes that the trophic level has been high and stable over the last 25 years.

Figure 18 Catch composition of total catch biomass (except salmon) in the AI through 2003

![Catch Composition Graph](image)

Figure 19 Total catch (groundfish, herring, shellfish, and halibut) and trophic level of catch in the AI through 2003

![Total Catch and Trophic Level Graph](image)

Cumulative Goals

TBD
4.8 Use adaptive approaches

- uncertainty, experimental approaches, consider multiple ecosystem states

Cumulative Goals

TBD

5 Council Advisory Team

The Council may choose to develop an advisory group that would become responsible for the AI FEP, would keep its information updated, and provide advice to the Council on actions relating to the Aleutian Islands in accordance with the outlined goals of the FEP. This advisory group could either be created as a new group, or the existing fishery management plan teams for groundfish, crab, and scallop, could be asked to serve this function in addition to their other duties.

Should an AI Ecosystem team be created, its initial charge, with the assistance of staff, would be to assist in the preparation of the Fishery Ecosystem Plan, and to periodically assist in updating it. Additionally, the team would provide advice on Aleutian Islands fishery management decisions facing the Council. The Aleutian Islands FEP and its goals would be used to evaluate future management actions affecting the AI SMA.

5.1 Option 1: Create an AI Ecosystem Team

The Council may choose to create a scientific ‘team’, under the oversight of the SSC and the Council, as an effective way to monitor its goals for AI fishery management. The AI Ecosystem Team could be similar to a Plan team, and would either meet on a regular, periodic basis, or ad hoc at the Council’s request.

The Council would decide whether the team should be drawn from fishery management agencies, such as those that already participate on the Plan teams, or from a broader range of agencies with interest in the Aleutian Islands. If the Council chooses to broaden the participation, the Ecosystem Team could serve a broader ecosystem approach to ocean management function in addition to the specific role of guiding the Council regarding its Fishery Ecosystem Plan. Representatives on the team could come from several groups based on their activities in the region, special expertise in ecosystem values or functions that should be part of fishery management decision making, or special interests in the outcomes of management decisions. These might include representatives from the U.S. Fish & Wildlife Service, a CDQ group, a consortium of villages and communities, the Aleut Corporation, the University of Alaska Fairbanks, the Environmental Protection Agency or Alaska Department of Environmental Conservation or other entity involved in Amchitka Island research and remediation, the Alaska Fisheries Science Center and National Marine Mammal Laboratory, and NOAA-NOS and NOAA Fisheries.

An advantage of a new team would be that the membership can be specifically selected among those scientists working on the Aleutian Islands area. Additionally, representatives from each of the major fisheries, as well as other managers and researchers of resources that interact with the fisheries, can all meet together to provide advice to the Council.

5.2 Option 2: Use the existing FMP Teams as advisory teams on the AI FEP
The Plan Teams already represent a broad cross-section of fishery, mammal, and seabird biologists, ecologists, and economists. Membership in these groups has been chosen to represent the greatest expertise on these fisheries. As a result, the Plan Teams may be ideally suited to provide the Council with advice on AI management actions, using the FEP goals and assessments as a guide.

One disadvantage of using the Plan Teams as advisory bodies is that they rarely meet together, and doing so is logistically difficult. Therefore each team would be providing the Council advice independently without the benefit of interaction. This will place more responsibility on the SSC to sift and collate such advice.

Appendix A  Fishery Ecosystem Plans

What is a Fishery Ecosystem Plan?

The Fishery Ecosystem Plan (FEP) was described in detail in the Ecosystems Principles Advisory Panel (EPAP)'s Report to Congress in 1999. Excerpted material from that report, describing the principles, goals, and policies of ecosystem-based fishery management, and the steps to develop a FEP, is included at the end of this appendix. In brief, the FEP is intended to provide the mechanism to integrate the ecosystem goals, principles, and policies into single species or species complex FMPs.

A FEP describes the interactions of the ecosystem, and the degree to which they are considered in conservation and management measures, including the efforts being made to monitor the effects of fishing. In order to address the goal of maintaining ecosystem health and sustainability, the FEP should develop indices of ecosystem health as targets for management.

The FEP is intended to:

- "provide Council members with a clear description and understanding of the fundamental physical, biological, and human/institutional context of ecosystems within which fisheries are managed;
- direct how that information should be used in the context of FMPs; and
- set policies by which management options would be developed and implemented," (EPAP 1999).

Regulatory authority, and interaction with FMPs

FEPs are to be developed for each ecosystem area, and a FEP would likely apply to more than one FMP. In the North Pacific, for example, an Aleutian Islands FEP would apply to the Federal groundfish (BSAI and perhaps GOA, depending on the boundary of the Aleutian Islands ecosystem), king and Tanner crab, scallop, and salmon FMPs. There is no explicit discussion in the EPAP report as to the interaction of the FEP with state water fisheries; however, it would be desirable for the Council to coordinate with the State when developing the FEP.

In terms of regulatory authority, the EPAP report generally recommends that specific management measures be included in the FMPs, and that the FEP provide an ecosystem policy and understanding from which management measures could be developed for the individual FMPs as necessary. Yet the report does suggest that those regulations or management measures which extend across individual FMPs be contained in the FEP. The example used is essential fish habitat protection measures, which may apply to all fisheries, and thus including them in the FEP would reduce redundancy.

The intent of the report was for FEPs to eventually become required by law, and to meld with FMPs in the long term. At present, however, there is no authority attached to a FEP, and only the FMP can authorize regulations to implement management measures. Therefore it would not be possible, without a change in statute, for a FEP to authorize regulations. Management measures must be incorporated at the FMP level, not the FEP level.

This means that the influence of the FEP would be to extend an ecosystem policy over the FMPs in the ecosystem area, but not to prescribe management measures. This policy would guide the development of management measures in each FMP. The FEP would also contain an assessment of how to determine whether the goals and objectives of the ecosystem policy are being met.

Examples of Fishery Ecosystem Plans

There are very few examples nationally of Fishery Ecosystem Plans, and they do not provide a clear template of how to do FEPs. The Chesapeake Bay FEP embraces many of the concepts of the Ecosystems Principles Advisory Panel, including developing a strategic plan that accounts for the role of habitat and predator-prey relationships, social and economic considerations, and unpredictable externalities such as climate impacts. The FEP does not specify what measures management agencies should undertake, but instead lays out what is known about the ecosystem, and the kind of research and monitoring needed by fishery managers. It also includes the impacts of non-fishery activities on, for example, fish habitat. The South Atlantic Council has taken a similar approach in developing their FEP. Their FEP expands upon their existing Habitat Plan to include a characterization of the biological and physical dynamics, an assessment of existing agencies and management institutions, development of a food web model, development of indices of ecosystem health, updated habitat requirements for managed species, determination of total removals, specification of research and monitoring needs, and further development of appropriate management measures.

A different concept was adopted by the Western Pacific Council, with their Fishery Management Plan for Coral Reef Ecosystems of the Western Pacific Region. The 2001 plan is the first ever ecosystem-based plan for fisheries developed in the United States. It incorporates many of the principles and policies recommended by the EPAP. The goal of the FMP is to establish a management regime for the entire Western Pacific Region that will maintain sustainable coral reef fisheries while preventing adverse impacts to stocks, habitat, protected species, or the ecosystem. The FMP measures include the designation of zoned Marine Protected Areas (MPAs) for coral, a recommendation of the EPAP report.

In FY04, Congress allocated $1.98 million for NOAA Fisheries to conduct ecosystem pilot projects in four regions: New England, Mid-Atlantic, South Atlantic, and Gulf of Mexico. The plan is to 1) use a public process to determine management objectives, threats and alternatives, 2) hold technical workshops for establishing guidelines in applying ecosystem principles to fisheries management, and 3) develop quantitative methods and software (models and GIS tools) to aid in evaluating management options and consequences. Each of the four Councils (MAFMC, NEFMC, SAFMC, and GOMFMC) received $225,000 from NMFS to develop their pilot programs. The SAFMC is further along in this project, and is already developing an FEP; the other Councils are focusing on the development of ecosystem-based goals and objectives and for implementing the FEP approach.

BSAI and GOA Groundfish FMPs as an example of a FEP?

The Council’s revised BSAI and GOA groundfish FMPs contain many elements of a FEP. The revised management policy, adopted by the Council following the PSEIS analysis, is a broad, ecosystem-based policy. It contains goals and objectives for each of the ecosystem components, and a management approach statement that provides a means to balance ecological, social, and economic objectives. Many of the recommendations of the EPAP are incorporated in the groundfish management program, such as buffers against uncertainty, indices for ecosystem health, long-term monitoring data, and the habitat needs of many of the ecosystem’s fish species.

One difference between the groundfish FMPs and a FEP as intended by the EPAP is that the groundfish FMPs apply only to a single species complex in each management/ecosystem area, rather than all fisheries in that area. Also, much of the ecosystem information that is used in managing the groundfish fisheries is not contained in the FMP, but rather is available to managers in supplemental documents such as the SAFE reports, including the annual Ecosystem Considerations appendix. Including such information in the FMP could be restrictive as the knowledge base for such information is constantly
expanding, and the formal process for amending the FMP may not be sufficiently efficient as to keep it up to date.

Fishery Ecosystem Plan for the Aleutian Islands

A Fishery Ecosystem Plan for the Aleutian Islands would be a stand alone document, developed along the lines of the EPAP. The AI FEP would provide an assessment of the Aleutian Islands ecosystem, and would provide guidance, through goals and objectives, to managers of all fisheries in the Aleutian Islands ecosystem area. The FEP would have no regulatory authority.

The FEP would allow the Council to include a focused consideration of the role of each ecological component of the region (e.g., seabirds, marine mammals, communities, industries) in the sustainability of the whole, when making decisions on Aleutian Islands management actions.

Possible issues that might be addressed under a FEP are briefly listed below.

- For management decisions that result in harvest of non-target species, to what extent are these non-target species important as prey for other fish, seabirds, or marine mammals?
- For management decisions that might result in incidental take of seabirds or marine mammals, what is the current population status of these seabirds and marine mammals? Are the trends up or down? Would the possible incidental take of seabirds or marine mammals, or removals of their prey items, have any measurable effect on their populations?
- For management decisions that result in harvest of target species, what are the population dynamics of those target species and to what extent would harvest change those dynamics? What other species of fish, seabirds, or marine mammals rely on these target species? How might current harvests affect future geographic distribution of target species, spawning locations and success, juvenile production, and recruitment (to both a fishery and to the reproductive segment of the population)? How might fisheries affect the behavior of predators that rely on this target species biomass?
- The Council might consider ecosystem response to biomass (energy) removals by fishing, in time and space, as well as ecosystem response to biomass (nutrient) inputs from offal and discards at sea and point source nutrient input along the Coast (processor waste). In part, this is a redistribution of energy in the ecosystem – how is this affecting the marine system?
- The Council might consider the phenology of both target species and non-target species and how harvest might alter the timing of key events in the life cycle of these species. For example, could spawning be shifted in time because of harvest removals of spawning fish during a particular time period?
- The Council would consider uncertainty in the scientific knowledge of natural mortality for target fish and non-target species, and develop management policies to address uncertainty.
- What process might the Council employ to adaptively learn about ecosystem impacts of fishery management decisions and employ this new knowledge in future decision making? How might the Council adapt management measures to compensate for environmental change or regime shifts?

Spatial boundary and application

The definition of an ecosystem often includes a geographic component, but conspicuous boundaries in marine systems are rarely evident. Because the FEP does not authorize management measures, a specifically delineated boundary that can be charted in regulations is not necessary. Instead, the ecosystem boundary may be specified in other terms.
Recent publications have suggested that the size of an ecosystem might be considered to be the geographic extent of the foraging distances for a top consumer species in that area. Ciannelli et al. (2004) define the aerial extent of the Pribilof Islands ecosystem as that oceanic area that accommodates the energetic demands of the principal predatory species, the northern fur seal – that is, encloses the area of highest energy balance and lowest biomass import (which in this case is approximately a 100 nm radius around the islands). Certainly that boundary is not a precise 100 nm, but rather a less-well-defined boundary based on foraging, which may shift from season to season and year to year. Concepts such as central place foraging may be helpful perspectives in defining an approximate ecosystem boundary for management decisions. Section Error! Reference source not found. discusses recent research on ecological divisions in the Aleutian Islands.

The AI FEP would apply to all fisheries within the Aleutian Islands ecosystem area, not just the BSAI Groundfish FMP. The FEP would consider the interactions of fisheries with each other, as well as with other components of the ecosystem.

**Effect on existing FMP measures**

The development of the FEP itself would not be disruptive to federal fishery management. Barring a change in statute, a FEP cannot authorize management measures, and such authority would remain vested in the FMPs. The associated paradigm shift that could increase the Council’s awareness of the ecological impacts of management actions, however, may result in amendments to the FMPs governing the Aleutian Islands fisheries.

The scope of the FEP is broader than either of the two previously considered options, as it would consider all components of the ecosystem, and provide goals and objectives for managing fishery impacts from all Federal fisheries. As such, fisheries other than the BSAI groundfish fishery may be affected.

The FMPs in the Aleutian Islands area would likely be amended to acknowledge the use of the FEP as a reference for ecosystem considerations, and the guidance of the FEP’s ecosystem objectives.

**Implementation**

The FEP would describe the AI ecosystem, including spatial boundaries, predator-prey interactions, habitat needs of the significant food web components, and current and historic states of the ecosystem. Indices of ecosystem health, such as are included annually in the Ecosystem Considerations chapter of the groundfish SAFE report, would be used to assess all impacts, natural and anthropogenic, on the ecosystem. An excerpt from the EPAP’s 1999 Report to Congress (Appendix B) describes the components of a FEP. Goals and objectives for the ecosystem would be developed by the Council.

The development of the FEP would require a cooperative effort among many agencies, as the AI FEP would need to consider impacts from other activities in the Aleutian Islands area relative to fishery impacts. Expert authorities from the State of Alaska, USFWS, and the Aleutian Islands communities would likely all be involved in developing the FEP. A mechanism for periodic re-evaluation of the FEP would also need to be devised.

**Utility in conserving the Aleutian Islands**

The FEP would give the Council an opportunity to examine and incorporate the impacts from all sources on the Aleutian Islands ecosystem, and take action to balance adverse impacts accordingly.
Excerpt from Ecosystem Principles Advisory Panel (1999)

**Principles**
- The ability to predict ecosystem behavior is limited.
- Ecosystems have real thresholds and limits which, when exceeded, can effect major system restructuring.
- Once thresholds and limits have been exceeded, changes can be irreversible.
- Diversity is important to ecosystem functioning.
- Multiple scales interact within and among ecosystems.
- Components of ecosystems are linked.
- Ecosystem boundaries are open.
- Ecosystems change with time.

**Goals**
- Maintain ecosystem health and sustainability.

**Policies**
- Change the burden of proof.
- Apply the precautionary approach.
- Purchase “insurance” against unforeseen, adverse ecosystem impacts.
- Learn from management experiences.
- Make local incentives compatible with global goals.
- Promote participation, fairness, and equity in policy and management.

**Recommendations**

Develop a Fisheries Ecosystem Plan
- Delineate the geographic extent of the ecosystem(s) that occur(s) within Council authority, including characterization of the biological, chemical, and physical dynamics of those ecosystems, and “zone” the area for alternative uses.
- Develop a conceptual model of the food web.
- Describe the habitat needs of different life history stages for all plants and animals that represent the “significant food web” and how they are considered in conservation and management measures.
- Calculate total removals – including incidental mortality – and show how they relate to standing biomass, production, optimum yields, natural mortality, and tropic structure.
- Assess how uncertainty is characterized and what kind of buffers against uncertainty are included in conservation and management measures.
- Develop indices of ecosystem health as targets for management.
- Describe available long-term monitoring data and how they are used.
- Assess the ecological, human, and institutional elements of the ecosystem which most significantly affect fisheries, and are outside Council/Department of Commerce (DOC) authority. Included should be a strategy to address those influences in order to achieve both FMP and FEP objectives.
Measures to Implement FEPs

- Encourage the Councils to apply ecosystem Principles, Goals, and Policies to ongoing activities.
- Provide training to Council members and staff.
- Prepare guidelines for FEPs.
- Develop demonstration FEPs.
- Provide oversight to ensure development of and compliance with FEPs.
- Enact legislation requiring FEPs.

Research Required to Support Management

- Determine the ecosystem effects of fishing.
- Monitor trends and dynamics in marine ecosystems (ECOWATCH).
- Explore ecosystem-based approaches to governance.
Ecosystem Committee Minutes
December 6, 2005 1-4:30 pm
Birch Room, Hilton Hotel, Anchorage, AK

Committee: Stephanie Madsen (chair), Doug DeMaster, Dave Fluharty, John Iani, David Benton, Jon Kurland, Jim Ayers, Diana Evans (staff)

Others present included: David Witherell, Bill Wilson, Jon Pollard, Earl Krygier, Cathy Coon, Lenny Corin, Linda Kozak, Kristy Despars, Sandra Moller, Clarence Pautzke, Terry Quinn, Jane DiCosimo, John Gauvin, Michelle Ridgway, Donna Parker

The Ecosystem Committee discussed the five items on its agenda. The next Ecosystem Committee meeting will be on Tuesday, February 7, 2006, starting at 1 pm, at the Doubletree Hotel in Seattle, WA.

1. Ecosystem Forum in the Aleutian Islands

Ms Evans provided an overview of the Council’s progress with the State of Alaska and other Federal agencies regarding a regional ecosystem collaboration in the Aleutian Islands. The meeting materials and meeting summary from the most recent meeting in mid-November was discussed. Ms Madsen reported that overall the meeting generated interest and cautious support among the agencies. Dr Fluharty identified sources of information for similar regional collaborations elsewhere in the nation. Ms Madsen noted that the initial boundary of the Aleutian Islands considered for this forum includes the islands west from Unimak Pass.

2. Report on the NOAA Research Council External Ecosystem Task Team (eETT)

Dr Fluharty reported on the preliminary findings and recommendations of the external Ecosystem Task Team, of which he, Ms Madsen, and Dr Terry Quinn are members. The eETT was created to provide advice to NOAA on its science and research programs as they relate to NOAA’s overarching goal to protect, restore, and manage the use of coastal and ocean resources through ecosystem-based management. The ecosystem goal cross-cuts the nine NOAA line offices, and Dr Fluharty noted that part of the challenge is to make a centralized and line-office driven coordinating and asset distribution function build toward a regional ecosystem approach.

Members of the Committee provided feedback to Dr Fluharty and the eETT regarding NOAA’s approach to Congressional appropriations, the consideration of Alaska as a single regional ecosystem complex, the importance of maintaining the regional focus and identifying contacts for each regional ecosystem, and the need to replace aging infrastructure.

3. Summary of Pacific States Marine Fisheries Commission (PSMFC) report

Dr Terry Quinn presented a summary of a recent PSMFC report, “Strengthening Scientific Input and Ecosystem-Based Fishery Management for the Pacific and North Pacific Fishery Management Councils.” The report was based on a panel discussion of six scientists, including Dr Quinn. Among other things, the report provides a definition of ecosystem-based management, and practical steps for the Council to take to move forward with ecosystem-based management.
The Committee discussed the report, including the issues of balance and tradeoffs, and the fact that an ecosystem approach such as envisioned in the report has not yet been actuated. Mr Benton asked Dr Quinn how the findings of the report might apply to the Council's Aleutian Islands Fishery Ecosystem Plan action. Dr Quinn suggested the following guide: first, to identify the interactions in the Aleutians, including spatial relationships and human activities. The recent volume of Fisheries Oceanography devoted to the ecology and oceanography of the Aleutian Islands provides much of this information. Second, the Council should consider what it wants to accomplish in the Aleutian Islands. By listing societal goals, and the various forms of human involvement in the Aleutian Islands, tradeoffs will become evident. This would provide a way to move forward.

4. Discussion of ecosystem elements of MSA reauthorization bills

Ms Evans presented a brief summary of ecosystem elements of the Bush Administration’s MSA reauthorization bill. There are no specific references to the ecosystem in S 2012, Senator Stevens’ reauthorization bill.

The Committee discussed the bills briefly, and noted that neither reauthorization bill would prevent the Council from proceeding with its AI Fishery Ecosystem Plan as currently conceived. Dr Fluharty suggested that the Council may want to consider some kind of workshop with other regions that are working on FEP efforts, such as Hawaii and the East Coast.

5. Aleutian Islands Fishery Ecosystem Plan (FEP)

Ms Evans summarized four discussion items relating to the AI FEP for the Committee’s attention: to revise the purpose and need statement to reflect SSC comments from October, 2005; to comment on the outline and the focus on cumulative and aggregate effects; to identify whether the FEP should contain goals and policy; and to consider the role of an AI Ecosystem Team. The Committee proposed various changes to the discussion paper, and recommends that staff revise the paper to make appropriate edits, addressing the SSC’s comments from October, and incorporating the ideas from the PSMFC report. The Committee recommends that the discussion paper be brought back before the Committee and the Council at the February meeting, and intends to make recommendations to the Council at that time.

Specifically, the Committee requested staff include and compare the Council’s ecosystem-based management definition with the definition arrived at in the PSMFC paper. The Committee also noted that other definitions not addressed in the PSMFC paper, such as a definition used by the NMFS-Council working group on ecosystem guidelines, could also be included. The staff discussion paper should also include a section to describe how the FEP will function as a planning document.

The PSMFC report recommended specific steps for the Council to take to advance their ecosystem-based management approach (see pages 7 and 14 of the report). The revised staff discussion paper should address how the process of developing the FEP will accord with these steps. Analytical tools such as the traffic light approach highlighted by Dr Quinn in his presentation should also be explored.

The Committee decided that discussion of an Ecosystem Team should be deferred.
